Salt Lake Tribune

State of the State

By Lisa Church

GRAND--The Glen Canyon Action Network, a recently formed organization that advocates the draining of Lake Powell, says it will open an office in a restored Moab ice-cream plant and parlor in the spring. The group says the controversial proposal to drain the lake where the Colorado River backs up behind Glen Canyon Dam in southern Utah would restore the river to its natural flow, preserving the river's watershed.

The Action Network is affiliated with environmental groups in several Western states, and a group in France, which are dedicated to the preservation of the world's rivers. The construction of Glen Canyon Dam in the 1950s and early 1960s, eventually inundated picturesque Glen Canyon.

To get acquainted with Moab residents, Action members are holding an ice-cream social free of charge on Monday at the Moab Arts and Recreation Center, 111 East 100 North at 7 p.m. The group plans to move into a restored creamery to be named Restoration Creamery at 21 N. Main in March. Members will make ice cream named after Colorado River features -- like Marble Canyon Fudge -- to help raise money for their efforts.

New group plans drain-the-lake rally

By TODD GLASENAPP, Sun Correspondent

PAGE -- A new organization based in Moab, Utah, is planning a March rally near Glen Canyon Dam to stir up public sentiment for draining Lake Powell.

The three-week-old Glen Canyon Action Network will bring a few heavyweights in the river-restoration community to the March 14 event, said organizer Owen Lammers. Lammers, a 37-year-old Berkeley graduate and former director of the California-based International Rivers Network, has a commitment from 87-year-old David Brower, the father of the movement to drain Lake Powell.

Brower, the Sierra Club's executive director from 1952-69, wants to restore a free-flowing Colorado River through Glen Canyon near Page. Reaction to Lammers' announcement from defenders of the dam and lake was swift and predictable.

"The GCAN objectives to 'protect and restore' the Colorado River by removing such manmade improvements as Glen Canyon Dam and others is merely their way of making headlines in the near term," said Larry Tarp, president of Page-based Friends of Lake Powell.

The government is doing a good job of managing the Colorado, Tarp said. The dam provides flood control, water storage, electrical generation, environmental improvements and recreation.

Draining the lake could produce "an out-of-control flow of sand-laden water in some parts of the year" and "a trickle at the bottom of a dust-filled canyon for the rest of the time," Tarp said Thursday night.

When it formed on New Year's Day, Glen Canyon Action Network became the latest of several groups to organize on the side of Brower, the Sierra Club's first paid executive director.

Brower didn't like the idea of damming Glen Canyon when it was authorized more than 40 years ago.

He renewed his objections a few years ago, and the Sierra Club's board of directors voted in 1996 to recommend draining the 186-mile-long reservoir. Salt Lake City- and Flagstaff-based Glen Canyon Institute organized before the Sierra vote and has since taken the lake-drain lead.

Lammers came to Moab at the end of December to organize the Action Network along with Ken Sleight, an early Colorado River boatman and an old friend of late author Edward Abbey.

In "The Monkey Wrench Gang," Abbey described a fictional plot to blow up Glen Canyon Dam. Moab, an old haunt of Abbey's, is 268 miles northeast of Page. Moab straddles the Colorado in southeast Utah.

Lammers is billing the event at the Carl Hayden Visitor Center a "Restoration Celebration and Rendezvous." He said it will coincide with the Third Annual International Day of Action Against Dams and for Rivers Water and Life.

"Our purpose at Glen Canyon will be to help usher in the 'Century of River Restoration,'" he said by electronic mail Thursday. "People will be coming from throughout the West and across the country on their way to Glen Canyon."

Also expected are Berkeley's Robert Hass, former poet laureate and co-founder of River of Words, a national poetry and art project advocating river restoration.

Also committed to the rally is Katie Lee, an author, singer and former river-runner.

Lammers is working with the Bureau of Reclamation's regional office in Salt Lake City to obtain necessary federal permits. Spokesman Barry Wirth said the event would be the first of its kind in his 13-plus years at BOR.

Participants might make "a little bit of a march" across the bridge to the visitor center near the dam, Lammers said. Speakers and music also are planned.

"This is not some Earth First! initiative," he said in a telephone interview. "I come from a very sophisticated blend of activism. We're not out there just to make a show."

Lammers turned International Rivers Network from an all-volunteer organization into what he says is recognized as the world's leading river advocacy organization during 12 years there.

He said he helped organize and lead campaigns across the globe to halt construction of dams and helped lead efforts to reform the lending practices of financial institutions that fund "inappropriate infrastructure projects, such as dams."

Glen Canyon Dam was built by the federal government in the late 1950s and early 1960s to harness part of the Colorado for the arid Southwest. But its utility is ending, Lammers said.

"The Bureau of Reclamation and other agencies did an excellent job to develop our rivers, but we have learned a lot since then," he said. "We know we can live with less water, we can use less energy, and we know the power of nature to regenerate itself." Lammers' approach differs from that of other activists, who want to persuade Congress to order an environmental impact study of draining the lake.

"This is not a top-down approach, coming from Washington," he said, "but a bottom-up approach from the people ... it's a people's movement."

He's setting up an office in Moab in an old ice cream parlor and plans to establish field offices in Flagstaff and other locations. Lammers is also planning a "Hot Fudge Monday Feed and River Revival Night" to welcome his organization to Moab next Monday.

"The opposition to that dam has had its roots in this town for 40 years," Sleight said in a news release. "It's no surprise that folks in Moab are getting on with the task of leading the nation to get that reservoir drained."

Four-year-old Glen Canyon Institute has not joined the rally as a principal, though several of its board members helped establish the Action Network, Lammers said.

Moab Times Independent

Group Opens Ice Cream Shop with Mission to Drain Lake Powell

Where just an ice cream parlor once stood, the headquarters for a nationwide effort to protect and restore the Colorado River is now evolving. The shop, located at 21 N. Main St., will soon house the headquarters for the Glen Canyon Action Network -- a grassroots group dedicated to the integrity of the Colorado River watershed.

Over the past two months, a group of Moabites have teamed-up with river restoration groups in Utah, Arizona, California, New Mexico and even France, to launch the organization. And Jan. 24, the group will hold its inaugural event at the Moab Arts and Recreation Center.

GCAN's immediate priority is building broad-based national and international support for the draining of Lake Powell.

"The restoration of Glen Canyon, more than any other initiative, encompasses all the issues that must be addressed if we are to sustainably manage this river for generations to come," said John Weisheit, GCAN's president.

"The opposition to that dam has had its roots in this town for 40 years; it's no surprise that folks in Moab are getting on with the task of leading the nation to get that reservoir drained," said Ken Sleight, one of GCAN founders.

Sleight and others will be hosting GCAN's inaugural event on Monday evening, January 24 at the MARC. There, Sleight will be discussing the history of opposition to the Glen Canyon Dam, and the role Moab residents have played in keeping the idea of a restored Glen Canyon alive since the reservoir began filling in 1963.

Susette Weisheit, GCAN campaign committee chair, will introduce GCAN's immediate plans, especially the rally to take place at Glen Canyon Dam March 14.

"Tens of thousands of people will be out in support of rivers all over the world on this third annual International Day of Action against dams. We here in Moab want to be right alongside them," Weisheit predicted.

Also in attendance will be Owen Lammers, who for the past 12 years led the development of International Rivers Network, now the world's leading river advocacy organization. Lammers, who recently relocated to Moab has since joined GCAN and will discuss the rapidly growing international movement to remove dams, and the leadership many activists around the world see coming from a restored Glen Canyon.

Admission is free and refreshments will be available.

"But don't forget the ice cream," says Weisheit. "Three days after our rally at Glen Canyon, GCAN will open Restoration Creamery, where every scoop of ice cream sold will help another gallon of water soon drain out of that reservoir."

Politics Only Hurdle to Draining Lake Powell, New Analysis Reveals

The Stanford Environmental Law Journal recently published an 88-page analysis of the Sierra Club's 1996 proposal to restore Glen Canyon on the Colorado River by draining Lake Powell reservoir.

The extensively researched analysis titled, "Undamming Glen Canyon: Lunacy, Rationality, or Prophecy" was written by Scott Miller, an attorney with the Office of the Solicitor, U.S. Department of the Interior. The analysis is his own, however, and in no way represents any official government position on the future of Glen Canyon Dam.

Mr. Miller examined: existing laws pertaining to the management of the Colorado River; technical and economic issues pertaining to anticipated impacts on water storage and energy supply; and the variety of impacts associated with changes in the recreational uses within Glen Canyon. Some key findings are excerpted below.

LAW OF THE RIVER: If we take a close look at the [Sierra Club] proposal, we may find that there is flexibility still hidden in the rigid Law of the River. We may also find crucial benefits to making the Law of the River itself more flexible.

WATER: Practically speaking, the effects of draining Lake Powell on water availability are surprisingly minimal, though not altogether absent. Politically, speaking, however, effects on water use are the most difficult problem facing the Sierra Club's proposal.

POWER: Although Glen Canyon's raw generating capacity of 1,300 MW is impressive, it is not irreplaceable. ... Furthermore, there is currently significant surplus of power in the Colorado Plateau region, so there would be a significant amount of time to find alternative sources of raw power. By the time additional sources of power are needed the life-span of Glen Canyon Dam's powerplant may be considerably reduced; in a few hundred years, accumulated sediments will completely eliminate power production from Glen Canyon Dam.

RECREATION: Perhaps the most fundamental question concerning recreation, however, is how much recreation do we really want on Lake Powell and in the Grand Canyon? ... The two-and-a-half million visitors to Lake Powell leave an extraordinary

amount of trash on the beaches and on the lake. Along Lake Powell's 2,000 miles of coastline there are only forty-six restrooms. Fouled by human waste, beaches along the lake are periodically closed. Visitors consume about five million gallons of gas on their Lake Powell vacations each year. Perhaps present recreation should be limited in any case. Doing so might also limit any costs of draining Lake Powell."

ENVIRONMENT: In sum, environmental costs and benefits associated with draining Lake Powell are presently unclear. Here, perhaps more than any other issue, our current knowledge is severely insufficient to accurately evaluate the consequences. At the same time, the [Colorado] Plateau's native fishes, the Sea of Cortez's vaquita and totoaba, and the delta itself may not wait for decades of study.

CONCLUSIONS : This preliminary analysis of water, power, recreation, and the environment reveals that some of the common assumptions about the importance of Glen Canyon Dam and Lake Powell may not be accurate. Even so, analysis has its limitations. There are values involved that simply cannot be balanced with dollars or any other economic valuations. ... Just look to the Florida Everglades, where the federal and state governments have already spent \$3.5 billion and plan to dedicate nearly \$8 billion more to habitat restoration, or the Columbia River where \$3 billion already has been spent trying [to] save and restore the salmon and steelhead.

"Although preliminary, Miller's analysis represents the best compilation of facts to date concerning the proposal to drain Lake Powell. The barriers to a restored Glen Canyon are not so much technical or economic, as political. It was politics that inundated Glen Canyon, and it will be a people's movement that will bring about its restoration," said Owen Lammers, Executive Director of the Glen Canyon Action Network, the Colorado River advocacy group based in Moab, Utah.

"This analysis helps to further awaken the public to the potential of reviving the declining ecosystems in the Grand Canyon," said Lisa Force, of the Tucson-based Center for Biological Diversity, the nation's leading advocate on behalf of endangered species. "The more people who become aware that the Grand Canyon is itself endangered by Glen Canyon Dam, the sooner the dam's decommissioning will become a reality." This issue of the Stanford Environmental Law Journal also published a foreword by Dr. Richard Ingebretsen, President of the Glen Canyon Institute, based in Flagstaff, Arizona.

Copies of the analysis are available from GCAN at (435) 259-1063, or through the fulfillment office of the Stanford Environmental Law Journal (650) 725-0183. To obtain contact information for the author, Scott Miller, contact GCAN.

Draining exercise: Lake Powell study challenges common assumptions

By GARY GHIOTO, Sun Staff Reporter

Arizona Daily Sun

A report published this month in the prestigious Stanford Environmental Law Journal challenges commonly held notions about the significance of Glen Canyon Dam and Lake Powell for recreation, water storage and electric power production.

Acting on his own initiative, Interior Department attorney Scott Miller examined the Glen Canyon Institute's proposal, endorsed by the Sierra Club Board of Directors in 1996, to restore Glen Canyon on the Colorado River by draining the Lake Powell reservoir and decommissioning its mighty dam.

Miller found that the technical, economic and legal hurdles to drain the reservoir are not insurmountable, but the politics may be.

The Sierra Club plan -- ridiculed by Utah and Arizona federal lawmakers as "absolutely ridiculous" -- would restore the river to free-flowing condition by diverting water through two tunnels inside the massive structure.

In time, the gigantic reservoir would disappear, the defunct hydropower dam would stand as a concrete relic to the Bureau of Reclamation's macro engineering and Glen Canyon would emerge from a 40-year-old watery grave.

In a bow to the controversy to drain the lake, Miller calls his analysis: "Undamming Glen Canyon: Lunacy, Rationality or Prophecy?" Not surprisingly, the report has been praised by environmental groups such as the Tucson-based Center for Biological Diversity, a national advocate of endangered species.

"This analysis helps to further awaken the public to the potential of reviving the declining ecosystems in the Grand Canyon. The more people who become aware that the Grand Canyon is itself endangered by Glen Canyon Dam, the sooner the dam's decommissioning will become a reality," said Center spokesman Lisa Force.

But defenders of the dam, such as Larry Tarp of Page-based Friends of Lake Powell, say draining the lake would be an environmental and economic disaster.

The loss of pollution-free electric power from the dam, a multimillion-dollar recreation industry and a first-class trout fishery that generates \$2 million annually are among the dubious byproducts of draining the reservoir, he said.

Tarp also notes that the reservoir provides a reliable source of water for 22 million people and 3.5 million acres of agricultural land in Arizona, Nevada, California and Mexico.

Draining Lake Powell would mark the return of a river with "an out-of-control flow of sand-laden water in some parts of the year" and "a trickle at the bottom of a dust-filled canyon for the rest of the time."

Page real estate officials estimate that draining the lake would reduce the town's population from 9,000 to 3,000 and produce enormous drops in property values and tourist visits.

Miller's report comes as the newly formed Glen Canyon Action Network, a Colorado River advocacy group based in Utah, prepares to launch a national campaign to restore the river.

"Although preliminary, Miller's analysis represents the best compilation of facts to date concerning the proposal to drain Lake Powell. The barriers to a restored Glen Canyon are not so much technical or economic, as political," said Owen Lammers, executive director of Glen Canyon Action Network.

"It was politics that inundated Glen Canyon, and it will be a people's movement that will bring about its restoration," Lammers added.

"A Restoration Celebration and Rendezvous" sponsored by the Glen Canyon Action Network, will begin March 14 at noon at the dam's Carl Hayden Visitor Center. Invited speakers include prominent environmentalists, such as David Brower of Earth Island Institute, legendary Colorado River boatman Ken Sleight and Green Party presidential contender Ralph Nader.

On March 13, the restoration of Glen Canyon will be the focus of a discussion from noon to 5 p.m. at NAU's University Union Field House. At 7 p.m., a "Colorado River Revival Concert and Rally" will be held at NAU's Cline Library Auditorium.

Opponents plan to stage a competing rally in Page on March 14. The Glen Canyon Institute, a 500-member nonprofit group with offices in Flagstaff and Salt Lake City, is currently conducting a wide range of studies justifying the restoration of the canyon. The studies include gauging the impact on the economy caused by draining the reservoir and environmental effects on the Colorado River basin themes also explored in Miller's analysis.

MILLER'S THESIS

Though an employee of the government, Miller's analysis is his alone and does not represent "any official government position" on the issue of draining Lake Powell. Indeed, efforts to fund any study regarding the issue have been routinely plucked out of the Interior Department's appropriations bill by western lawmakers such as U.S. Sen. Orrin Hatch, a Utah Republican. Hatch has also sponsored legislation to block attempts to decommission the dam.

Miller noted that evaluating the Sierra Club's proposal has been stymied by a lack of hard data and that critics have relied on that lack of knowledge to outline a host of gloomy scenarios. Miller examined existing laws pertaining to the management of the Colorado River, the impact on water storage, energy supply, recreation and the environment, citing voluminous government, private and academic sources.

He found that while it is "technically" feasible to decommission that dam, the political will to do so may be in short supply due to potent opposition from water and power utilities, the recreation industry and local stakeholders such as the Navajo Nation and the residents of Page.

The major difficulty revolves around decades of water supply contracts, federal policy and legal rulings that have created a "Law of the River" that makes removal of the reservoir difficult. But Miller writes: "If we take a close look at the proposal, we may find that there is flexibility still hidden in the rigid Law of the River. We may also find crucial benefits to making the Law of the River in itself more flexible."

Adding to the problems for the Sierra Club plan is a schism between "recreationists and environmentalists" over the issue.

"Recreation, both above and below the dam, would change dramatically, exchanging houseboaters for hikers, and trout fishermen for wilderness rafters," said Miller.

WATER ISSUES

Letting the Colorado River run free has "panicked" water users and administrators for "thirsty" southern California water utilities that see the reservoir as drought insurance, said Miller's analysis.

Miller said, however, Lake Powell's value as a storage facility is "probably negligible" because the Colorado River Basin would still retain significant storage with a free-flowing river. He also notes that evaporation from the reservoir is a significant factor: "The evaporative losses from a single Labor Day weekend could satisfy 17,000 homes for an entire year."

Sedimentation from the Colorado's muddy flow also diminishes the reservoir's worth too, he said.

The loss from draining the lake would amount to 1 million acre-feet of water per year. Evaporation estimates range from 550,000 to 1 million acre-feet per year, said Miller. But draining the lake would have consequences. Sediment from Lake Powell would flow to Lake Mead downstream, shortening the life span of the lake. There would also be a chance of flood damage downstream. But Miller noted that the Sierra Club's proposal is to retain the dam so it could be used as an emergency flood control device.

The draining of Lake Powell would end its potential use as a "diversion point" for the Navajo Nation.

The tribe wants to divert 50,000 acre-feet annually from the lake "to satisfy some of its reserved water rights to the Colorado River" Miller said.

LESS POWER

The Glen Canyon Dam produces 5,000 gigawatts of electricity a year, enough to supply 214,000 California users.

"This electricity, and the revenues it generates, would be lost," said Miller.

But Miller said the lost power from the dam could be "easily replaced" because there is a surplus of power in the Colorado Plateau region. The dam's capacity is "far exceeded" by the Navajo Generating Station in Page which actually produces "almost twice as much power". The value of Glen Canyon Dam's hydropower comes from its use by electric utilities to provide instantaneous power at peak times by simply spilling water through its generators. But its ability to produce instant power is hampered today by new operations rules that seeks to reduce the "havoc" downstream caused by the highly variable flows, said Miller.

In effect, Glen Canyon's capacity and load-filling capability have been reduced, and power revenues are estimated to have decreased by \$30 million annually. The need for raw power to satisfy fluctuating demands for power can be satisfied by building a gas or oil-fired plant fitted with the latest technology to reduce air pollution, Miller said.

The costs of losing the dam's power and building other sources would have to be borne by consumers, and air pollution would result, concludes Miller.

RECREATION LOSSES

Lake Powell attracts 2 million overnight visitors per year who contribute more than \$400 million to the local economy. The area's five houseboat marinas, guides and local businesses depend on the crush of annual visitors.

The regulated flows from Glen Canyon have benefited downstream river-rafting companies relying on dependable and manageable flows. Meanwhile, the cool, clear

waters released from the dam have "created one of the finest trout fisheries in the Southwest" that generates about \$2 million annually.

Miller acknowledges that the current value of "Glen and Grand Canyon recreation is immense." But the loss of houseboat and ski boat vacationers, plus trout fishing enthusiasts, can be offset, Miller said.

The revival of river trips through Glen Canyon would generate "tens of millions of dollars" and the restoration of Glen Canyon would "likely draw more recreationists to the area than it could possible accommodate."

Miller acknowledges criticism that draining the reservoir will leave muddy sediment and trash as well as an enormous bathtub ring caused by the tons of leaching sediment from rock formations.

But citing studies from Glen Canyon Institute, he said the sediments can be flushed away and the bathtub ring effect removed with five to 10 years through natural processes.

ENVIRONMENTAL IMPACT

Miller noted that in the late 1950s, when the dam was being proposed, no environmental impact studies were conducted or required. Since then, the impact of surging, silt-free water flows on the Colorado River basin and its Sea of Cortez delta have revealed a plethora of depressing data.

Disappearing sand bars and beaches have endangered fish, birds and mammals along the river corridor to Mexico, Miller writes. Severe declines in the river's eight native fish species have been linked to the construction of the Glen and Hoover dams, introduction of exotic fish species and "the destruction of habitat and the alteration of the Colorado's water quality, quantity and temperature."

Far downstream in Mexico, the reduce flows of the river have been linked to the decimation of Sea of Cortez fish species such as the vaquita and totoaba that depend on brackish estuary habitat. Restoring river flows in Maine, Vermont and California by tearing down dams have yielded impressive results.

"Habitat, and fish populations with it, have dramatically and rapidly improved following removal of the dams," he writes.

Meanwhile, the recreation industry on Lake Powell leaves an annual legacy of shameful pollution and hydro-carbon excesses, he added. "The two-and-a-half million visitors to Lake Powell leave and extraordinary amount of trash on the beaches and on the lake. Along Lake Powell's 2,000 miles of coastline there are only 46 restrooms. Fouled by human waste, beaches along the lake are periodically closed. Visitors consume about five million gallons of gas on their Lake Powell vacations each year ...," Miller reported.

On a positive note, Miller said that the existence of Lake Powell's massive reservoir and dam blunted the push for more dam development and water storage projects elsewhere in the West and contributed to the restoration and preservation of the Platte River and Mono Lake and Owens Valley.

But because there has been a lack of studies to evaluate the environmental benefits and negatives, it's hard to draw iron-clad conclusions, he said.

"In sum, the environmental costs and benefits associated with draining Lake Powell are presently unclear. Here, perhaps more than any other issue, our current knowledge is severely insufficient to accurately evaluate the consequences. At the same time ... the (Colorado) Plateau's native fishes and the Sea of Cortez's vaquita and totoaba, and the delta itself may not wait for decades of study." Miller concludes his analysis with an open invitation to the public and decision-makers to fully explore the Sierra Club proposal that has "sparked the imagination of many Americans."

"Draining Lake Powell may or may not be in our best interests or even in the best interests of our grandchildren. But we should have the integrity and sensibility to reexamine decisions that we have made in the past ... We owe it to ourselves, future generations, and the lands of the Colorado River to finally evaluate the costs and benefits objectively."

Activists to rally at Glen Canyon Celebration to focus on draining Lake Powell

By BRIAN HANSEN, Staff Writer

Colorado Daily

Just drain it.

That will be the rallying cry heard along the banks of the once-wild Colorado River next month, as representatives of more than 50 groups will gather at the massive Glen Canyon

Dam to call for the draining of Lake Powell. The March 14 event, dubbed the "Colorado River Restoration Celebration and Rendezvous," will include appearances by noted environmental activists, artists and legendary river-runners, said Owen Lammers, executive director of the Moab, Utah-based Glen Canyon Action Network.

"We're going to reinforce to the public that we are entering a new era of river management, which is focused on restoration and sustainable management of the entire Colorado River Basin," Lammers said.

The event, which will be held at Lake Powell's official visitor center, will likely culminate with the signing of a declaration calling for the decommissioning of the Glen Canyon Dam and the implementation of a full-scale recovery plan for the area "innundated" by the waters of the 186-mile-long reservoir, Lammers said.

A Sierra Club-backed proposal to drain Lake Powell was rejected by a Congressional subcommittee in 1997. But the notion of decommissioning the Glen Canyon Dam has never really gone away, and according to Lammers, a new report by the U.S. Interior Department shows that the technical, economic and legal hurdles to draining Lake Powell would not be insurmountable.

"One of the issues that (the report) reinforces is that there's plenty of electricity within the region to provide substitute generating capacity to compensate for the potential losses that would accompany the decommissioning of the dam," Lammers said. "This is completely independent of potential conservation measures that could also be implemented within the basin."

The report notes that the dam's capability to produce power will eventually be eliminated anyway, as sediments carried along in the Colorado River fill up the relatively stagnant reservoir.

Given that scientific certainty, there's no reason not to take action now, Lammers said. "The Glen Canyon Dam is going to have to be decommissioned within the next 100 to 150 years anyway, because (Lake Powell) will be sufficiently full of sediment that (the power plant) will no longer be able to be operated," Lammers said. "Recognizing that, what value are we going to derive from Glen Canyon over the next period of time?" Lammers noted that in addition to the inevitable demise of the dam's power-generating abilities, the other principal service provided by the reservoir -- recreation -- will also soon have to be curtailed.

"There will have to be limits imposed anyway because of overuse and pollution," Lammers said. "These issues are going to have to be addressed anyway, even when the sediment ultimately makes it impossible to have a reservoir."

The March 14 event at the Glen Canyon Dam will feature noted environmentalist David Brower, former poet laureate Robert Hass, and folk singer Katie Lee. For more information, see the Glen Canyon Action Network's Web site at www.drainit.org.

Draining Lake Powell A Foregone Conclusion, Study Says

By Robinson Shaw

Environmental Network News

Glen Canyon Dam, which blocks the Colorado River two miles northwest of Page, Arizona, was constructed from 1957 to 1964. An 88-page analysis of the Sierra Club's 1996 proposal to restore Glen Canyon recommends that the federal government consider draining Lake Powell.

The study, published in the Stanford Environmental Law Journal, does not draw any conclusions but makes a case for further exploration of the Sierra Club's push to restore Glen Canyon to its natural state.

"The report is a good summary of a lot of the information out there," said Owen Lammers, director of the Glen Canyon Action Network. "It documents that draining the lake isn't just something of pure fantasy but something that can be done, something that ultimately has to be done."

The report, "Undamming Glen Canyon: Lunacy, Rationality, or Prophecy," is the independent work of Scott Miller, an attorney with the U.S. Department of the Interior. Miller's analysis does not represent the department's position on Glen Canyon or Lake Powell.

Glen Canyon Dam was initiated through the Colorado River Storage Project and authorized by a slim congressional majority vote on March 1, 1956. Construction began a year later without any environmental analysis. The dam submerged the unique geologic rock formations of Glen Canyon and created Lake Powell to the north.

Lake Powell, named after American geologist and ethnologist John Wesley Powell, was created when Glen Canyon Dam was built on the Colorado River. In his study, Miller examined laws governing Colorado River management; technical and economic issues pertaining to water storage and energy supply; and the impact of recreational activities within the Glen Canyon area.

All parties agree that draining Lake Powell is feasible, according to the report. At issue are the costs and benefits associated with decommissioning the dam.

"Decommissioning Glen Canyon dam would significantly impact regulation of Colorado River water and would affect water availability throughout the Colorado River Basin," the report states. "It would completely eliminate the substantial power that is produced at the dam and distributed across the Southwest. Recreation, both above and below the

dam, would change dramatically, exchanging houseboaters for hikers and trout fishermen for wilderness rafters. Just as dramatic and probably farther reaching would be the changes in the environment, including changes of stagnant water to natural flows, stable mud to volatile toxic sediment and desert flats to delta estuaries.

Water

"One of the biggest hurdles is getting water users to recognize that they can indeed survive without an insurance policy, which is the lake behind Glen Canyon dam," said Lammers.

Water use and administration are topics of heated debate, according to the report. The sandstone banks of Lake Powell absorb an estimated one million acre feet of water each year. While most of the water in the Colorado River is utilized, about one million acre feet of water are absorbed each year by the sandstone banks of Lake Powell. Another 550,000 acre feet simply evaporate into the dry desert air.

Water allocation and flood protection are sources of contention between upper-basin states (Colorado, New Mexico, Utah and Wyoming) and lower-basin states (Arizona, California and Nevada).

Power

"Although Glen Canyon's raw generating capacity ... is impressive, it is not irreplaceable," the report notes. The dam produces about 3 percent of the electricity in the region. The lost power could be replaced by gas or oil-fired power plants, but both are sources of air pollution.

"There is currently significant surplus of power in the Colorado Plateau region, so there would be a significant amount of time to find alternative sources of raw power. By the time additional sources of power are needed, the life span of Glen Canyon Dam's power plant may be considerably reduced; in a few hundred years, accumulated sediments will completely eliminate power production from Glen Canyon Dam," the report notes. Before Glen Canyon Dam was built, the Colorado River on a typical June day carried through the Grand Canyon enough sediment to fill the Rose Bowl to the rim, according to the report.

"It's not a matter of if and when (the lake is drained and the dam decommissioned). It's a matter of if people choose to intervene in the natural process that's going to happen anyway," said Lammers. "That's the case with all dams — eventually they all have to be decommissioned, especially when you're dealing with significant amounts of sediment."

Recreation

Lake Powell annually attracts two million visitors who contribute more than \$400 million to the local economy and consume about five million gallons of gas on holidays. Loss of revenue from recreation is another source of debate.

Before Glen Canyon Dam was built, visitors to the area could explore the canyon on foot and commune with spectacular geologic formations.

Environment

Glen Canyon Dam has significantly altered the ecology above and below it. The Colorado River was once a warm river with variable flow. Today it runs clear, cold and steady. Five of the river's eight native fish species are extinct or endangered because of cold temperatures and loss of native habitat.

"It is possible that nothing short of draining Lake Powell will save the endangered fish, birds and mammals of the Colorado River, its delta and the Sea of Cortez," the report notes.

"(Glen Canyon Dam) certainly wouldn't have been built now and it certainly wouldn't have been built 20 years ago," said Lammers. "We now have a lot more information on the social, environmental and economic impact associated with river development and the technical constraints which are causing us to rethink how we manage rivers."

Carl Hayden Visitor Center, Glen Canyon Dam, near Page, Arizona 12:00 Noon - 2:00 PM, Tuesday, March 14, 2000.

[Click here](#) to download the booklet for the Teach-In and Rally

On March 14, 2000, people from across the country will join more than 50 organizations and businesses at Glen Canyon Dam to celebrate a new era in river management, the "Century of River Restoration." Led by long-time Colorado River advocate and environmental leader David Brower, the event will include a signing ceremony of the "Glen Canyon Declaration," calling for the restoration of the Colorado River and Glen Canyon.

Over the past century, the Colorado River has undergone extensive transformation. The construction of dams throughout the basin has resulted in diversion of the entire river's flow, such that the river no longer reaches its estuary at the Gulf of California. Populations of native fish in the world renowned Grand and Glen Canyons have been decimated.

"We're thrilled by the outpouring of support we're seeing from all across the country for restoring Glen Canyon," said Owen Lammers, Executive Director of Glen Canyon Action Network, the Colorado River advocacy group based in Moab, Utah. "We are on our way to Glen Canyon, building a movement to restore the world's most beautiful canyons and a world-class river."

"The people are coming to celebrate all that this river has brought," said Sage Douglas Remington, Executive Director of the Native Environmental Justice Advocacy Fund. "The Indian people of the Colorado Plateau have long had an important relationship with the waters of the Colorado River. We join together today and commit to employing the same spirit, vision and ingenuity which developed and subsequently damaged this watershed, to heal its wounds, restore its integrity, and ensure its ability to sustain the people and ecosystems that depend on it."

Similar events will be taking place at dams and along rivers around the world on this, the Third Annual International Day of Action Against Dams, and for Rivers, Water and Life. "There is a rapidly growing global movement for 'Living Rivers'," said Juliette Majot, Executive Director of the California-based International Rivers Network. "We're excited to be part of the leadership for restoration. The Colorado, long a symbol of the development of rivers, is now becoming a symbol of society's growing commitment to heal them."

This is a significant step for Glen Canyon, the Colorado River and rivers throughout the world. A people's movement is now forming to embark on a restoration journey unparalleled in the history of river management. Starting with Glen Canyon and working up and down the watershed this effort will promote water, energy, agriculture and restoration policies that will ensure the long-term health and integrity of the Colorado River.

The ceremony will commence with an invocation by Thomas Morris, President of the Dine [Navajo] Medicine Men's Association, followed by a blessing by Reverend Yusen Yamato, a Zen Buddhist Monk representing Global Peace Walk 2000. In addition to Mr. Brower, Ms. Majot, Mr. Remington, and Mr. Lammers, other speakers include: Dr. Robert Hass, Poet Laureate of the United States 1995-97; Anna Frazier, representing the Navajo environmental organization Dine CARE; Katie Lee, folksinger and longtime advocate for Glen Canyon who will be visiting the dam for the first time; Ken Sleight, outfitter and Colorado River advocate; Lisa Ramirez, dam removal advocate with Friends of the Earth; and Lisa Force, dam removal advocate with the Center for Biological Diversity.

On Monday, March 13, Colorado River advocates will be gathering for a Teach-In on Glen Canyon issues in the Kaibab Room at Northern Arizona University's Student Union

Fieldhouse, from 12:00 Noon - 5:00 PM. An evening concert and Glen Canyon slide presentation featuring folksingers Ms. Lee, Peg Millett, and Bill Oliver will be held at NAU's Cline Library Assembly Hall from 7:00 until 9:00 PM.

The Arizona Republic

Glen Canyon Dam: Keep it or raze it?

By Judd Slivka

Marjorie Doland became part of Page in 1957, six years before Glen Canyon Dam. The town was a temporary building holding five stores, plus five rows of workers' barracks with frontier plumbing.

Doland spent the early years straining her tap water through stockings and waiting for the weekly grocery truck.

She remembers - not fondly - Page before the dam created Lake Powell.

"There was nothing here," she said. "Not a blade of grass. Not a tree. Just . . . sand."

Now there's Page, a town of 10,000 people. But now there also are those who want the dam torn out to help restore the Colorado River to a more natural state.

Both sides will be out at the dam at midday today proclaiming their points of view. As unlikely as undamming may sound, the issue is moving closer to critical mass - and reflects a broad clash between what the West once was, what now is and visions of what some people want it to be.

Town officials note that Page survives because of the lake. It gets its power, its water and the majority of its revenue from the lake.

But environmentalists note that the Colorado has been severely affected by the dam, and that water releases have changed vital parts of the river's ecosystem.

A recent law journal article, written by a federal official in his personal capacity, called for federal consideration of decommissioning the 38-year-old dam. Two groups - one of which is rallying today - exist for the sole purpose of restoring Glen Canyon to its natural state.

This is not a popular idea in Page.

So a rival group, Friends of Lake Powell, will rally on the other side of the dam. And Page merchants have been asked to close for an hour today, to simulate the ghost town dam boosters say Page will become if Lake Powell is drained away.

Glen Canyon Dam remains former Sierra Club President David Brower's greatest regret. Given a choice of building a dam there or in Dinosaur National Monument, Brower recommended Glen Canyon, site unseen - and says he's still haunted by the decision.

In his twilight years, the late Sen. Barry Goldwater professed that if there were one vote he could do over, it would have been his vote to dam Glen Canyon.

Noland, a former City Council member and mayor, isn't sure she'll attend today's rallies.

"I can see both sides of it," she said, "and I just don't know. I'm thinking about going, but I'm not sure."

To which one?

"Oh - Friends of Lake Powell, of course."

That would be anathema to David Orr's ears. Orr, a longtime proponent of restoring the Colorado, is field director of the Utah-based Glen Canyon Action Network, a group recently founded to work for the decommissioning of Glen Canyon Dam.

In addition to today's noon rally, the group has planned a teach-in today and assembly tonight at Northern Arizona University.

"We want the Bureau of Reclamation to become known as the Bureau of Restoration," Orr said. "We would like to see the premier dam-building agency in the federal government to become the premier river-restoration agency."

Orr added: "What is being done here is being watched by environmental groups around the country and around the world."

Which does not thrill Mayor Robert Bowling who, along with the City Council and the Chamber of Commerce, has promoted Friends of Lake Powell.

"Although tourism is the major economic force, power, water and light manufacturing are also factors," Bowling said.

"The bottom line is, without water all things in addition to tourism go."

Glen Canyon Declaration Signed. [Click here](#) to read the declaration.

Today people from across the country joined more than 50 organizations and businesses to celebrate and inaugurate "The Century of River Restoration" at Carl Hayden Visitors Center at Glen Canyon Dam, Arizona. Led by longtime Colorado River advocate and environmental leader David Brower, the event was highlighted by a signing ceremony of the "Glen Canyon Declaration," calling for restoration of the Colorado River and Glen Canyon.

David Brower, who has led the fight to save Glen Canyon for 40 years, addressed the festive crowd with his concerns about dam safety, water evaporation, seepage, and sustainable economics. He described Glen Canyon as a rich and beautiful landscape that should have become a national park as early as the Franklin D. Roosevelt administration.

Brower was joined by Thomas Morris, president of the Diné Medicine Men's Association, whose organization unanimously voted to drain "Lake" Powell on Saturday, March 11th, and who gave the invocation at the river rendezvous and celebration. Morris said, "'Lake' Powell Reservoir has submerged our sacred sites and destroyed our ability to communicate with sacred gods. These sites must be restored for our children and grandchildren."

Yvon Chouinard, owner of Patagonia, Inc., the world's leading manufacturer of quality outdoor clothing, stated in a letter read at the celebration, "The construction of Glen Canyon Dam more than any other dam in the United States represented the most blatant disrespect for the planet's sacred landscape -- all for a facility that we know was not needed."

Significant parts of the declaration--presented by John Weisheit of the Moab-based Glen Canyon Action Network, primary sponsor of the celebration, and Phil Williams of International Rivers Network--include:

- The Bureau of Reclamation should begin the process of developing and then implementing a decommissioning plan for Glen Canyon Dam.
- The Bureau of Reclamation should establish a federal laboratory to serve as the nation's primary research facility for river and riverine habitat restoration, and give strong consideration to locating this facility in the town of Page, Arizona.
- All new management plans affecting the Colorado River watershed should undergo rigorous analysis of basinwide impacts.
- No new dams within the Colorado River watershed should be constructed, nor should existing dams be reconstructed in the event of their failure.
- Operating licenses should be required for all federal dams, as has long been the case with all non-federal dams. Federal dams must be subject to periodic relicensing reviews to ensure compliance with all environmental laws and safety standards.

- The Bureau of Reclamation should provide funding to support scientific research on the biological and habitat requirements of the endangered native fish of the Colorado River.
- The National Park Service should implement a program to quantify, monitor, and evaluate the presence of a wide range of pollutants including toxic and radioactive metals, petroleum compounds, bacteria, and other contaminants in Lake Powell Reservoir.

"We're thrilled by the outpouring of support we're seeing from all across the country for restoring Glen Canyon," said John Weisheit, President of Glen Canyon Action Network. "We are on our way to Glen Canyon, a movement of people seeking to restore the world's most beautiful canyons and a world-class river."

The celebration was one of 65 actions taking place in twenty other countries today on this, the Third Annual International Day of Action Against Dams, and For Rivers, Water and Life. "There is a rapidly growing global movement for 'Living Rivers,'" said Juliette Majot, Executive Director of the California-based International Rivers Network. "We're excited to be part of the leadership for restoration. The Colorado, long a symbol of the development of rivers, is now becoming a symbol of society's growing commitment to heal them."

Among the organizations and businesses endorsing the declaration are: Alaska Action Center, American Lands Alliance, Arizona Green Party, Blue Mountains Biodiversity Project, Blue Water Network, Californians For Utah Wilderness, Center for Biological Diversity, Coast Range Association, Colorado Plateau River Guides, Columbia Gorge Audubon Society, Committee for Idaho's High Desert, Diné Medicine Men's Association, Earth First! Journal, Earth Island Institute, Environmental Law Society (Univ. of AZ), Environmental Resource Center (Evergreen Coll.), Escalante Wilderness Project, European Rivers Network, Eyak Preservation Council, Flagstaff Activist Network, Forest Conservation Council, Four Corners School of Outdoor Education, Free The Planet! (N.A.U.), Friends of the Earth, Friends of the Eel River, Friends of the River, Grassroots Environmental Effectiveness Network, Great Basin Mine Watch, Great Old Broads for Wilderness, GreenAction, Green Party Of Utah, Hells Canyon Preservation Council, International Rivers Network, John Muir Project, Living Arts Center For Ecology, National Forest Protection Alliance, Native Environmental Justice Advocacy Fund, Oregon Wildlife Federation, Oregonians for Utah Wilderness, Round River Conservation Studies, Sea Shepherd Conservation Society, Sky Island Watch, Solar Energy International, Southern Appalachian Biodiversity Project, Terra Firma (Univ. of UT), Utah Environmental Congress, Virginians for Wilderness, Western Land Exchange Project, Wetlands Action Network, Wild Angels, Canyon Voyages & Adventure Company, Back of Beyond Books, Moab Man Construction, Knave of Hearts Bakery, Fry Canyon Lodge, Tag-A-Long Expeditions, The Rio Colorado Restaurant, Wildland Scapes, and North American River Expeditions/O.A.R.S.

Rally Pits Advocates for Draining Lake Powell Against Those Who Support Glen Canyon Dam

BY MARK HAVNES for The Salt Lake Tribune

GLEN CANYON DAM, Ariz. -- Posters on the east side of Glen Canyon Dam proclaimed "Save Lake Powell," while placards on the west side pleaded "Drain It."

Those two views clashed Tuesday as hundreds gathered for dueling rallies staged near the Arizona dam just south of Utah's border.

Commissioned in 1963, Glen Canyon Dam formed Lake Powell and brought northern Arizona and southern Utah an economic boom driven by waves of recreationists, more than 2 million a year.

Friends of Lake Powell is proud of the dam and fighting to save it. The group points out the lake is the lifeline of nearby Page, Ariz., pumping \$100 million a year into the city's economy.

The Glen Canyon Action Network takes the opposite view. It argues that restoring the Colorado River to its natural flow would be more beneficial to downstream users because less water would be lost to evaporation and the porous sandstone that molds the lake.

Lake Powell backer Denny Judd said when he first heard talk of draining the reservoir he laughed, but not anymore as the movement to return Glen Canyon to its rugged form picks up steam.

The Kanab native attended the Friends of Lake Powell rally with a contingent from Kanab, 70 miles west of the dam in southern Utah. All sported bright red T-shirts broadcasting their support of the lake.

Judd, a shop owner and rancher, said he and other residents have learned from past experience with government officials and environmentalists not to discount any proposal that could threaten their way of life.

"We've seen the writing on the wall from the past, and are going to let folks know the majority don't want getting rid of the lake to happen," Judd said.

He is not alone.

Val Gleave, Friends chairman, said the notion of draining the lake seemed so preposterous at first that no one took it seriously. But as the idea gained momentum, business owners in Page along with the Chamber of Commerce formed Friends of Lake Powell to push their cause.

"One of our board members, who is a scientist, attends regular meetings on water usage, and he says other scientists are receiving a lot of peer pressure to consider a study of draining the lake," she says.

Gleave, whose group planned Tuesday's rally in response to the Glen Canyon Action Network's protest, also is concerned about the growing movement to drain other reservoirs with smaller dams.

"When the governor of Oregon favors taking two dams down for the salmon, that kind of trend concerns us," Gleave said.

In addition to hydroelectric power, storage capacity for a mushrooming Southwest and abundant recreation opportunities, Lake Powell supplies water for the nearby Navajo Generating Station. The Navajo Reservation hugs the southern shore.

About 700 people attended the Friends rally, with many businesspeople closing their stores for an hour in an attempt to dramatize how Page -- a resort city of 10,000 -- would become a "ghost town" without the lake.

On the dam's west side, the rally pushing to pull the plug on Lake Powell drew about 250.

They heard Steve Hannon -- a water attorney from Loveland, Colo., environmental author and member of the Moab-based Glen Canyon Action Network -- sum up the debate in three words: "politics, money and power, and not the wattage kind."

Hannon believes the issue will be resolved by pressure from Southern California water users, who will grow tired of losing 100 million gallons a year to seepage and evaporation.

Besides, Hannon argued, draining the lake actually would boost Page's economy. He said tourists from around the world would be drawn to the largest restoration project ever. And a new Glen Canyon would produce numerous natural beaches for camping and a Colorado River so tame that the most cowardly river runner could raft it.

"You could go down it on your rubber ducky," Hannon said.

Activists say the dam could be lowered gradually. Once the Colorado is flowing through the canyon, Hannon says an instant garden would spring up because of the accumulated silt.

David Orr, the Glen Canyon Action Network's director of field studies, said conventional ways of generating power are becoming obsolete and should be replaced with more sustainable and controllable sources, including solar energy.

"Drain Lake Powell" Ice Cream Shop Opens

Contact: Owen Lammers (435) 259-1063

Today on the eve of the Moab Half-Marathon, Mayor Karla Hancock of Moab, Utah, will cut the ribbon to open Restoration Creamery--a non-profit ice cream shop dedicated to the restoration of the Colorado River and its watershed.

Located in the heart of downtown Moab, Restoration Creamery will educate each customer on the potential for, and benefits of, restoring the Colorado River watershed. With more than a million tourists from across the country and around the world traveling through Moab annually, the Creamery's restoration message is expected to travel far and wide in a very short period of time.

"This is activism-driven business," says Owen Lammers, a founder of the Creamery and of the recently-formed Glen Canyon Action Network (GCAN). "It's time for activists to bring thier message from the backroom offices right onto Main Street, to interact with and educate the public every day, while raising money at the same time."

Lammers and other GCAN supporters from Moab just returned from their first major event, the Restoration Celebration and Rendezvous, held in Flagstaff, Arizona, and at Glen Canyon Dam, March 13-14. Activists, musicians, writers, indigenous leaders and river enthusiasts from as far away as Maine and Alaska were on hand to usher in the "Century of River Restoration." The events culminated in a signing ceremony of the Glen Canyon Declaration at Glen Canyon Dam. Nearly 200 people followed environmental leader David Brower, and Navajo Medicine Men's Association President Thomas Morris in signing their names to a declaration calling for decommissioning Glen Canyon Dam.

Ice cream lovers visiting Restoration Creamery may add their names to the declaration, while enjoying such delicious Glen Canyon favorites as: Music Temple Almond Fudge, Fern Canyon Mint Chocolate Chip, and Abbey's Rockey Road.

During its Grand Opening Weekend, Restoration Creamery will be sharing 25cents from every cone sold with Rim to Rim Restoration, a Moab-based non-profit organization building community partnerships for restoration projects, and with KZMU, Moab's community radio station, the first media source to give voice to GCAN's activities.

03/19/00

Forty years after Glen Canyon Dam was built, some want it taken down

By Mike Ritchey
The Denver Post

GLEN CANYON DAM, Ariz. - It's not just the Colorado River that they want to set free.

It's our thinking about how we interact with what's around us, with the environment.

That idea was powerful enough to draw some 250 people last Monday and Tuesday to the campus of Northern Arizona University in Flagstaff, and at the dam, two hours north, in Page.

During their sessions, participants from several Western states listened to stories, anecdotal and technical, and sang songs of protest and celebration.

Many support a proposal to drain Lake Powell by opening ducts at the bottom of Glen Canyon Dam and allowing the trapped Colorado River to run.

Yet they also seemed to agree that, though they would very much like to see Glen Canyon restored to its earlier grandeur, the point of their movement was aimed elsewhere.

"This movement is an effort to bring about a transformation in the way we think about our relationship to the land," said Owen Lammers, executive director of Glen Canyon Action Network, one of the environmental groups sponsoring the drive to not only turn the Colorado loose but to set free every river everywhere.

"Deep ecology is the study of how humans relate to the land and just what the sustainability of the land is. It is time for man to begin thinking like a river." As Lammers described it, no one should expect to one day see Glen Canyon the way it used to be, especially not anytime soon.

Other speakers elaborated. Bluff, Utah, geologist and river guide Gene Stevenson said that in the 40 years of the dam's existence, piles of silt - perhaps 100 feet or more - have settled on the canyon floor and in the side canyons and on the rocks, "and while we don't know how much, what we can be sure of is that we're talking decades, even centuries, before the canyon and the river will be fully brought back to life." In 1996, federal officials did try to undo some of the damage when one March morning Interior Secretary Bruce Babbitt opened up four floodgates at the dam and unleashed a torrent that washed down silt and rebuilt some beaches.

Babbitt declared it "a new beginning for the Colorado River, a new beginning for the Grand Canyon ecosystem and a new beginning in dam management." But to those who got together here last week, that was just a drop in the bucket. They want the dam put out of business.

It seems to the layman too huge a project to be seriously considered.

Yet, there is precedent for so many believing in the movement's eventual success.

One speaker recalled that Barry Goldwater, the late U.S. Republican senator from Arizona who was a moving force in the building of the dam, eventually changed his mind.

Before he died, Goldwater said that out of the thousands of votes he had cast in the United States Senate, the one he regretted, the one he would change if granted celestial opportunity, was the one in support of building Glen Canyon Dam.

In Goldwater's absence, however, another senator, Orrin Hatch, Republican of Utah, whose recent presidential primary campaign was unsuccessful, knows his conservative constituents would miss their water if he were to let their Lake Powell run dry, and has introduced legislation to prevent efforts by environmentalists to decommission the dam.

Dam-building is a nonpartisan issue. Liberals, conservatives, those in-between - most are all for it. A dam can support development or agriculture. The Glen Canyon plant generates more than 1.3 million kilowatts of electricity. When all eight of its generators are revved, more than 15 million gallons of water a minute will pass through it. The power - as much as 345,000 volts once it goes through transformers - goes to various markets.

And dam-building means jobs. For a legislator to be against building dams, well, he might as well turn down a second military base in his district. The lake too, provides employment for stores, marinas, motels and other businesses, from beer to bait.

The job of those who would drain the reservoir, second in size only to Lake Meade, downstream from Glen Canyon at Hoover Dam, is to alter public opinion, then to bring that opinion to play in the halls of Congress.

"I was ecstatic when the Sierra Club three, four years ago came out in favor of restoring Glen Canyon," said Ken Sleight, an old river runner from Moab, who owns and Sabotage not seen as option DAM from Page 29A operates Pack Creek Ranch just outside that bustling slick rock town. "Then, when Dr. Richard Ingebretsen, the professor over at the University of Utah, and the Glen Canyon Institute all came out in favor of this at the same time, well, it was what I've been waiting for all these years." Sleight, a friendly, generous, and very tough man, made his comments at a teach-in last Monday at the NAU campus. That event was organized by the NAU chapter of Free the Planet, an environmental outfit favored by young people around the world. Student leader Jason Silke, with his pierced ears and nose, was there with Sleight and Kent Frost, men in their 60s and 70s. They in turn mingled with singer, writer and activist Katie Lee, who is every bit of 79, and finally with David Brower, 88, the godfather of the environmental movement. Optimism welcome Silke and his colleagues had put a substantial program together in just two weeks. The infusion of youth's optimism was a welcome addition to the information-laden afternoon. The young people appeared to harbor no doubts that the Will of the People can and will prevail.

But will it, really? Will their will carry the day? And is their will indeed the will of the majority? And when the health of our rivers and of the planet itself is concerned, should the preferences of the majority matter? Or should it even be put to a vote? No matter your leanings on the issue, the sincerity of the participants bordered on the inspirational.

A video, "The Cracking of Glen Canyon Dam," made in 1981 and starring the late Edward Abbey, whose spirit hovered over the twoday celebration, was shown on Monday. In it, Abbey encouraged a small group who gathered back then to drape a black cloth "crack" over the side of the dam, to first exhaust the political approach, and, he said, "if that doesn't work, then sabotage." No one on Monday or Tuesday advocated sabotage. In fact, a major selling point for draining the reservoir is the claim that the dam cannot hold. It was, said several speakers, built in a bad place - on weak sandstone; a sponge that is and has long been leaking. And in June of 1983, a big water year but not one of the biggest, the dam almost was lost - 29 million acrefeet of water blasting down the Colorado River toward Hoover Dam and Lake (Reservoir) Meade; two years of full flow, running free, wild and with no good intention.

So, sabotage is only a word and a thought that is beneath thinking. Although it might be mentioned that in this, the 25th anniversary of Abbey's death, a commemorative edition of his "The Monkey Wrench Gang," which did embrace sabotage, is set for a June publication. It's already back-ordered.

Can Glen Canyon Dam be decommissioned, Lake Powell drained?

No one at the gatherings appeared to harbor any unreal dreams of when the reservoir would be emptied. Not on Monday at NAU, not on Tuesday, the International Rivers Day of Action, at Glen Canyon, when a declaration was adopted swearing to fight for lifetimes to restore the canyon - and further to make sure no other dams are built. Sierra Club early supporter David Brower, standing tall but clearly weak, tired from a long trip from his home in Berkeley, Calif., near-sea level, to over 7,000 feet, acknowledged that the Sierra Club, of which he was then director, supported the plan in the late 1950s as Congress was considering the construction of Glen Canyon Dam.

"I even wanted to build it 50 feet higher," Brower said.

But he had never seen Glen Canyon. Few had.

The Sierra Club compromised, sacrificing the Glen to save Echo Park, in Dinosaur National Monument where the Bureau of Reclamation, the agency in charge of building and maintaining dams, wanted to build another one.

"When I saw the Glen, I realized our mistake," Brower said. "I began working, and we had the votes in Congress to kill it. But I neglected to bring along my (Sierra Club) board, and without the club's backing, Congress let it go ahead." Brower saw the place and, like Barry Goldwater, changed his mind. He has spent the last 40 years (the dam was built in 1963), trying to correct what he sees as an enormous mistake.

Brower noted that he will not live to see the Glen restored, but Ken Sleight, his old friend and a warrior who has fought right alongside, said Tuesday that he considers the drive to restore Glen Canyon "an ongoing battle, one we're in until we die."

Drain Lake Powell?

By Amie Rose

St. George, Color Country Spectrum

GLEN CANYON DAM -- Two groups of people gathered on opposite sides of Glen Canyon Dam Tuesday.

The crystal blue waters separated a gathering organized by the Glen Canyon Action Network from another gathering organized by the Friends of Lake Powell. And although both groups gathered to talk about the lake, one group wants to drain it while the other group wants to save it.

Friends of Lake Powell gathered on the east side of the lake, across the dam from the Carl Hayden Visitor Center, where the Glen Canyon Action Network gathered.

Although most people at the event stand firmly on one side of the issue, at least two Page residents wanted to hear both sides.

Katrina Reid said neither side swayed her and her husband one way or the other, although she said she was interested in the difference between the two gatherings. She said the Glen Canyon Action Network's event was intellectual while the Friends of Lake Powell event was emotional.

"It's interesting to see what both sides are," Reid said.

Her husband, Kyle, added that they're trying to create some harmony between the two sides.

Law enforcement, though, worked hard to keep the two sides apart.

Joe Richards, Coconino County sheriff, said his office, the Arizona Department of Public Safety, the National Park Service, Page Police Department and the Bureau of Land Management have been working for more than a month to ensure a peaceful day for everyone.

He said between 70 and 80 officers worked as security along the dam and at both events.

"A strong law enforcement presence helped prevent problems," Richards said.

Officers aborted easy access from one event to the other by making each event accessible from only one direction. Neither group was allowed to protest at the other group's gathering.

When a bus, carrying members of the Global Peace Now, turned to go to the Friends of Lake Powell event, it was given a police escort out.

Mike Clough said he went to the Friends of Lake Powell gathering not only to save the lake, but his job. Clough works on houseboats at the lake.

"If I didn't come here I might not have a job," Clough said. "It's very important we keep the lake."

Several businesses in Page closed their doors from 11 a.m. to 12 p.m. to demonstrate what Page would look like without Lake Powell.

Scott and Virginia Ashton, of Fredonia, Ariz., said they also went to support Lake Powell.

"Hopefully we'll make sure that the lake says here," Scott Ashton said.

Clare Ramsay, a Garfield County commissioner, said he and fellow commissioner Louise Liston travelled to Page to support the dam, which provides electricity to their county.

"We're here to show our love for the lake," Liston said.

Ramsay added they also wanted to protest the idea of draining the lake.

"We wanted to let them know there is opposition to what those lunatics are trying to do," he said. "There's not a lot of people who're going to sit idly by."

People for the U.S.A. also joined with Friends of Lake Powell in the celebration.

Shauna Johnson, president of the Utah People for the U.S.A. chapter, said they had about 150 members go to the gathering.

She said the group supports Lake Powell because of the electricity the dam provides, the water storage, recreational use and economic benefit to the people in the area.

Johnson said she lived in Southern Utah before Lake Powell.

"When I was in high school, I kayaked in Glen Canyon," she said. "It wasn't accessible and Lake Powell is accessible. It's valuable to far more people than Glen Canyon was."

David Brower, the first executive of the Sierra Club, disagrees with Johnson. He said the Glen Canyon Dam was the greatest disaster of his life.

"The water hides the most beautiful scenery on earth," he said. Brower said he is partly responsible for the dam. He said if he'd kept the Sierra Club fully informed on the dam project, it wouldn't have been built.

"We had enough votes in the House of Representatives to stop it," he said.

Brower has spent years working to gain momentum in the movement to drain the lake.

"I'm glad I lived long enough to be here," he said.

Brower said the lake will have to be drained eventually, and the sooner it happens the safer everyone will be. He added that people don't realize the danger the dam poses.

"It could be a major disaster," he said. "In 1983 it almost collapsed. They were extremely lucky."

And, Brower said, the canyon can be restored at a fraction of the cost of not restoring it.

"We can revive it as a beautiful park," he said. "We can let the world know what it no longer needs to miss."

John Weisheit, president of the Glen Canyon Action Network, said the dam isn't worth the power and water storage it provides.

"(It) damaged the river and ecosystem," he said. "It was supposed to be a national park and we flooded it."

Weisheit said in the 1930s President Franklin D. Roosevelt decided four times not to make Glen Canyon a national monument because of political pressure.

"Rivers are forever and power plants and dams have a life span," Weisheit said.

He said the dam will eventually have to be decommissioned because it's filling with sediment and sand. The dirt will eventually compromise the safety of the dam because there won't be enough room for water. When it was built, he added, engineers said it would have a life span of 200 years.

Weisheit said people who do have a stake in the lake support draining it. He said people from the area, as well as people from neighboring states attended the event.

Beyond Crying for the Colorado Dam Shame

By James Ridgeway

Village Voice

The Colorado River is America's greatest natural treasure and a symbol of what the environmental movement ought to be fighting for. It begins in the high Rockies and drops 14,000 feet in a wild 1700-mile torrent to the Pacific Ocean. There is simply nothing else like it. To have been on this river is to have experienced a hallowed moment.

In 1956, horrendous judgment by the government led to the building of the Glen Canyon dam at the Colorado's upper end. The dam created a 300-foot-deep artificial reservoir called Lake Powell, covering the ancient riverbed lands of the Anasazi Indians and their descendants in the Navajo and Ute tribes. The water inundated canyons and tributary streams leading into the main river. So today, instead of the beautiful Glen Canyon, all you see are flotillas of stinking motorboats.

The dam and reservoir have led to the deterioration of the whole river. The reservoir--the second largest in the United States--and the downstream remnants of the Colorado are becoming a toxic sewer, transforming the river and its tributaries into a hazardous waste dump.

Since the dam went up, environmentalists have ranted against it. Edward Abbey dreamed of the day someone would blow it up. Wallace Stegner, the great western historian, fought it. Environmentalist David Brower at first fought the dam, then gave in as part of a deal to save other natural monuments. Now in his eighties and fighting cancer, he has returned to lead a last effort to dismantle it. Last December, a group of environmentalists, calling themselves the Glen Canyon Action Network (www.drainit.org), set up headquarters in Moab, Utah.

Their aim is to force the government to decommission the dam, drain Lake Powell, and restore the Colorado River. The group includes river rafters, small business owners, traditional Navajos, and a descendant of Brigham Young. In an era in which the federal government is having second thoughts about big dams--seriously discussing decommissioning three on the Snake River--Brower and his compatriots feel the time is right for a change in policy. For inspiration, there is Barry Goldwater. Shortly before he died, the right-wing Arizona senator was asked which vote he most regretted. "I wish I could take back the vote to put up the Glen Canyon dam," he replied, "and let that river run free."

David Brower's Last Chance: Taking Out Glen Canyon Dam

By Jeffrey St. Clair

The service station at Dangling Rope, one of the most remote in the United States, sells more gas than any other outlet in Utah. Oddly, the business is more than 50 miles from the nearest road, in one of the least populated landscapes of the lower-48 states.

Dangling Rope is a floating gas station, a marina drifting on the eerie, placid waters of Lake Powell. Three hundred feet below are the ruins of Glen Canyon, a natural Atlantis drowned in a man-made flood. The floating gas station, anchored in this surreal spot to refuel the flotillas of houseboats that prowl the reservoir, is a perfect symbol for the grim fate of one of the planet's natural wonders.

The reservoir, the second-largest in the United States, and the downstream remnants of the Colorado River are becoming inexorably toxified. Every four years the pollution discharged into the water from the thousands of motorboats and jet skis that ply the lake's stagnant waters is equal to the amount of crude oil spilled by the Exxon Valdez.

To top it off, more untreated human waste is dumped into the reservoir than any other body of water in the United States. Lake Powell is well on its way to becoming a hazardous waste site. It didn't have to be like this.

Perhaps more than any other single issue, Glen Canyon has haunted the conscience of the American environmental movement. At the center of the story is renowned environmentalist David Brower, whose trip down the canyon with Floyd Dominy, then head of the dam-building Bureau of Reclamation, was immortalized in John McPhee's book, *Encounters with the Archdruid*. It was Brower, the most creative and radical green of his generation, who signed off on the building of Glen Canyon dam in 1956, as part of a fateful deal to keep the Bureau of Reclamation from building the Echo Park dam on the Green River inside Dinosaur National Monument in northern Utah. That decision has weighed heavily on him ever since.

Now 87 years old and battling cancer, Brower has returned to the Four Corners region to inaugurate a new campaign aimed at decommissioning the dam, draining Lake Powell and restoring Glen Canyon. Brower's last charge represents a direct confrontation against one of the engines that has driven the development and destruction of canyonland country. He also sees it as a chance for a kind of personal redemption. "It's time to correct one of the most egregious errors of the last century," he says.

The Colorado River has been dubbed the American Nile. Both, of course, are desert rivers, coursing for much of their length through some of the world's most sun-scorched terrain. And each gave rise to great ancient civilizations, the empires of Egypt and the mysterious Anasazi, whose cliff-hugging communal dwellings still embroider the canyonland country. But beyond that it's not a particularly precise metaphor. For one

thing, the Nile is three times the size of the Colorado. For another, the Nile is a leisurely river, descending only about 6,000 feet in its 4,200-mile journey to the Mediterranean. The Colorado, born in the alpine snowpack of the Rocky Mountains, freefalls 14,000 feet in a headlong 1,500-mile rush to the Sea of Cortez. It is the compact power of the Colorado that sets it apart - the dramatic way it has slashed through the massive blocks of sandstone on the Colorado plateau, carving out the most bizarre and spectacular landscape on earth. It was a forbidding terrain that intimidated even the conquistadors, who stopped their pillaging forays at the first sight of its vast, seemingly impenetrable chasms.

The first whites to see Glen Canyon were almost certainly in the expedition of Major John Wesley Powell, the crusty one-armed Civil War veteran who floated down the Colorado in wooden dories in 1869. Powell's journal of that trip offers some of the finest nature writing of the 19th century and his detailed description of the canyon and the river remains one of the most precise and compelling. But Powell was no transcendentalist aesthete, no gritty Thoreau of the plateau. His mission wasn't merely to describe this uncharted territory, but to graph it out and discover a way to reclaim the parched land, making it suitable for habitation on a grand scale. The solution, arrived at over the next four decades, was to replumb the entire river system with a network of dams, ditches, canals, diversions, reservoirs and pipelines.

Powell went on to push for the creation of the Bureau of Reclamation in 1902. But the era of dam building had to wait for the competing parties to settle their differences over who would get what from the projects. The Colorado and its tributaries slice their way through seven states, and each one demanded a share of the action. Then there were the Indian tribes, Navajo and Ute, Apache and Havasupai, Hopi and Shoshone, whose rights to the water were undeniable if almost never recognized. The resolution of these claims and counterclaims to the waters of the Colorado resulted in a thick, convoluted and constantly evolving docket of regulations, contracts, court rulings and legislation, known collectively as the "Law of the River." Distilled, the Law of the River comes down to this: first in time, first in right. It's called the doctrine of prior appropriation and was an invitation to a feeding frenzy.

The big issue for the states was how the water would be divvied up. After years of squabbling, they came up with the Colorado River Compact of 1922, which divided the states into two groups, the Upper Basin (Wyoming, Colorado, Utah and New Mexico) and the Lower Basin (California, Arizona and Nevada). Each basin received rights to half of the Colorado's annual flow. The states in each group were left with the tricky choice of how to divide the water between themselves. By the time they were done, not even a freshet of the river would reach the sea. It has been sucked dry.

The first big dam to go up on the Colorado was Hoover in 1936, designed to funnel water to ever-expanding Los Angeles and the fields and ranches of the Imperial Valley. At the time, Hoover dam was the biggest structure ever built. Behind it, Lake Mead, the world's largest reservoir, held back two year's worth of the Colorado's annual flow. Speaking at the dedication ceremony, President Franklin Delano Roosevelt extolled the

project, touting it as the first move toward "altering the geography of the region." FDR's words were prophetic. The raising of that dam sanctified a certain mindset toward the arid lands, what the western historian Donald Worster has called "a world view of permanent subordination." Nature submerged is nature subordinated. Or as Dominy put it: "The Colorado unregulated isn't worth a damn."

The Hoover dam project also inaugurated another grand tradition of Western water schemes: corporate profiting from government pork. The Bureau of Reclamation didn't actually build dams: It planned them, lobbied for them, fudged numbers to make them seem more efficient and fended off attacks against them from Congress and conservationists. Dam building is big business and those billions of dollars were predestined to end up in the coffers of corporations. The lucrative contracts for Hoover dam alone transformed three relatively obscure firms (Kaiser, Bechtel and Morrison-Knudsen) into corporate Goliaths that have stomped around the globe causing ecological mayhem and human misery ever since.

Hoover was California's deal. Then the Upper Basin wanted its shot: Their scheme was grandiose, including dams at Flaming Gorge, Echo Park and Glen Canyon. But then in 1952 along came Brower, the newly hired executive director of the Sierra Club. Brower was outraged by the Bureau of Reclamation's plan to erect a dam at Echo Park inside the stunning canyons of Dinosaur National Monument. The proposal brought back bad memories from an earlier era, when John Muir, the Sierra Club's patron saint, fought a futile battle against the flooding of the beautiful Hetch-Hetchy valley in Yosemite National Park in 1913. After that travesty, the Club made a pact: no more dams inside national parks or monuments.

Brower was a master organizer, generating one of the first great national campaigns in the history of the environmental movement. But from the beginning, Brower's focus was riveted on keeping a dam out of Dinosaur National Monument. At all costs, he feared resetting the precedent of Hetch-Hetchy. So Brower proposed a compromise. In exchange for keeping a dam out of Dinosaur, the Sierra Club wouldn't oppose a dam at Glen Canyon. Indeed, Brower even supported a scheme to raise the height of Glen Canyon dam to accommodate more water storage.

As the dam began to be raised, Brower and photographer Eliot Porter took one last float down the river. They documented their trip in a stunning book, *The Place No One Knew*. It was a powerful, elegiac testimony to what had been lost, fully capturing the haunted beauty of the canyon. But the book's title was somewhat self-serving and deceptive. It is vital to understand that Glen Canyon was not a wilderness, per se. The Navajo and Ute tribes, and before them the Anasazi, had been living there for centuries. Many others knew and loved Glen Canyon, intimately and passionately, among them folksinger Katie Lee, river guide Ken Sleight, author Edward Abbey, historian Gregory Crampton and the thousands of people who had floated down the Colorado and San Juan rivers.

Another person who knew what would be lost with Glen Canyon dam was the writer Wallace Stegner, a close friend of Brower's who had floated through Glen Canyon twice.

Indeed, before the deal was finalized, Stegner told Brower that it was a mistake to trade Glen Canyon for Dinosaur National Monument. "Between us, Dave," Stegner said, "Dinosaur doesn't hold a candle to it."

Brower himself soon came to learn that Stegner was right. Looking back on it, he called the deal his "greatest mistake, greatest sin."

For two years the concrete poured nonstop into the towering pilings of the Glen Canyon dam, and the town of Page sprung up out of nothing nearby. It's now a city of more than 8,000 people. The floodgates on Glen Canyon dam closed on March 23, 1963. From the observation deck outside Page, a quarter-mile downstream from the dam, the 710-foot tall structure appears as a sleek blonde colossus sunk into the blood-red Navajo sandstone.

Admirers of Glen Canyon dam have compared the structure to the pyramids at Giza. It won't last nearly that long. One reason is that the reservoir is fast filling up with silt. The Colorado River deposits 65 million tons of sediment at its base every year. The mud is stacking up at the foot of the dam at the rate of between two and three feet a year. In a little more than 150 years, the silt will have reached the 425-foot level, where it will clog the penstocks that suck water into the power generating turbines. But the dam may breach well before then, as it almost did in 1983. That year heavy snows and a rapid snowmelt left the Colorado so flush with water that the dam nearly overtopped, becoming a 710-foot waterfall. At the same time, its spillways failed and the dam came close to a catastrophic breach. The flows of the river that year were high, but far from what the Colorado has reached in the past and will reach again sometime in the future. That hasn't been the only problem with the dam. For one thing, it leaks. The Navajo sandstone formation, the soft red rock that gives the canyon its Mars-like hues, is extremely porous; it sucks up water like a sponge. In fact, the entire base of the dam is waterlogged, shedding sheets of saturated sandstone. Internal memos from engineers at the Bureau of Reclamation suspected this would happen, but the reports were buried. At the same time, more than a million-acre feet of Lake Powell's water is lost to evaporation in the searing heat - that's enough water to meet the yearly needs of 34,000 homes.

But water was never the main issue at Glen Canyon. The big money at the dam comes from power generation. The huge turbines in the bowels of the dam generate 1,300 megawatts of power a year, enough power for 350,000 homes (though about 60 percent of it goes on the western power grid to industrial customers). But maddeningly, much of it is used to power engines that pump water from the reservoir on its way to Las Vegas, Phoenix and Flagstaff. In all, it provides less than 3 percent of the electricity for the region.

There was one final insult. Back in 1956, Brower had fought for and won protection for a side canyon harboring Rainbow Bridge, the glorious natural arch that is also one of the most revered sacred sites for the native peoples of the Southwest. But it soon became clear that the Bureau of Reclamation had ignored the deal and that the waters of Lake

Powell would creep up to the very base of Rainbow Bridge. An outraged Brower brought a lawsuit in federal court, but lost. The political nightmare unleashed by the Faustian bargain to save Dinosaur National Monument just kept getting worse.

In one way or another, Brower has spent the past 40 years trying to atone. Glen Canyon has become a testament to the perils of political deal-making when it comes to the environment. Brower repeatedly warns young environmentalists: "Never trade a place you know for one you don't."

The closing of the floodgates at Glen Canyon helped spark a new kind of militant environmental movement that rejects political deal-making and compromises. This new movement had a voice: Edward Abbey. Abbey didn't hold back; he raged against that dam and all it stood for, writing in 1968 that it must come down, one way or another. He envisioned the following scenario for the reservoir's dedication in *Desert Solitaire*:

Perhaps some unknown hero with a rucksack full of dynamite strapped to his back will descend into the bowels of the dam. There he will hide his high explosives where they'll do the most good, attach blasting caps to the official dam wiring system in such a way that when the time comes for the grand opening ceremony, when the President and the Secretary of the Interior and the governors of the Four-Corner states are all in full regalia assembled, the button which the President pushes will ignite the loveliest explosion ever seen by man, reducing the great dam to a heap of rubble in the path of the river. The splendid new rapids we will name Floyd E. Dominy Falls, in honor of the chief of the Reclamation Bureau.

In 1981, *Earth First!*, the group inspired by Abbey's musings about monkey-wrenching, marked its arrival on the scene by dropping 300-foot-long plastic strip down the face of the dam, simulating a giant crack.

But Glen Canyon dam doesn't have to end with a boom. It can go out with a whimper and a wild whoosh of water. And that's just what Brower has set his sights on doing. In December 1999, he and a group of some of the finest environmental activists in the country set up shop right in the belly of the beast: in an old ice-cream parlor in Moab, Utah. They call themselves the Glen Canyon Action Network (<http://www.drainit.org>), and their goal is straightforward: build an international movement to force the government to decommission the dam, drain Lake Powell and restore the Colorado River.

The group includes river rafters, small business owners and traditional Navajo. It is headed by Owen Lammers, former chief organizer at the International Rivers Network, where for more than a decade he fought dams around the globe, most notably China's gargantuan Three Gorges project. The developing world is experiencing a spasm of dam-building, which is annihilating rich ecosystems and indigenous cultures. Lammers says that the best way to reverse this ugly trend is to target one of the most famous dams in the world and put it out of business. "That's Glen Canyon, and it's a good thing its located in the United States, because we need to show other nations that we are

serious about cleaning up our own messes," he says. "When Glen Canyon comes down, others will fall like dominos."

Is it possible to drain the lake? Yes. Even Dominy, Brower's old nemesis, says so - though, typically, he disagrees on exactly how it could be done. Under most scenarios, the dam itself would remain standing, the Colorado pouring through its floodgates, an absurdist relic of a lamentable era.

"The barriers to a restored Glen Canyon are not so much technical or economic as political," Lammers says. "It was politics that inundated Glen Canyon. And it will take a peoples' movement to bring about its restoration." The political barriers are familiar ones, though perhaps not as conniving and powerful as the old days. The Western congressional delegation has already reacted with predictable hostility, pushing through a legislative rider that bars the Department of Interior from ever examining the feasibility of decommissioning the dam. At the same time, the federal government is now looking at pulling the plug on four dams on the Lower Snake River along the Idaho-Oregon border to aid dwindling runs of salmon. Those dams provide nearly three times more hydropower than Glen Canyon.

Things change, and even the most craven politician can come to his senses when faced with angry constituents. For others it can be a simple matter of conscience. A few months before he died, Barry Goldwater, the right-wing senator from Arizona, was asked which vote he most regretted in his long career of infamy. "I wish I could take back the vote to put up Glen Canyon dam," Goldwater said. "And let that river run free."

Brower hopes to see that day soon. "The decommissioning of that dam will give the restoration era its big break and bring a lot of joy to the 1,600 miles of Glen Canyon and its side canyons that are magnificent gestures of the earth - to use Ansel Adams' phrase - unmatched on earth or anywhere else," he says. "They are waiting eagerly to be born again. I know, I asked them all."

Rally Seeks Support to Pull Plug on Lake Powell

By Lisa Church Special to the Tribune

MOAB -- Looking down into Lake Powell in southern Utah causes a strange sense of vertigo. The redrock rims visible below the water's surface are a beautiful, yet eerie, reminder that the houseboats and motorboats crowding the lake throughout the summer are floating above a canyon with sheer rock walls plunging hundreds of feet down into what was once the bed of the Colorado River.

Glen Canyon, the scenic sandstone chasm that was flooded to create Lake Powell, was the subject of a daylong workshop -- sponsored by the Colorado Plateau River Guides and the Glen Canyon Action Network, a group devoted to draining the lake -- in Moab on Sunday. About 80 people attended the event, which brought together several generations of river runners and environmental activists who presented lectures, slide shows, songs and film footage documenting the area before and after Glen Canyon Dam was built in the early 1960s. Since 1964, water backed up behind the dam has flooded more than 200 miles of canyon systems.

For some, it was an emotional journey back in time.

"What's under that reservoir was so incredibly beautiful. It was a crime and inhuman to do what they did to it," said folk singer Katie Lee, also an avid river runner who saw Glen Canyon for the first time in the 1950s. Prior to 1964, when the canyon was filled with water, Lee made almost 20 trips through the area, exploring, and she says naming, many of the endless side canyon spurs that made up the Glen Canyon network. At the time, the Arizona native was living in Hollywood, acting and singing in television and movies. By most measures, her career was on the fast track, but Lee says her experiences on the river, especially traveling through Glen Canyon, set her on a different path.

"It saved my life," Lee said. "It showed me the direction my talents would allow. I would have been a lousy famous person because I don't like people that much. But the river taught me I was going to be just fine with a small audience and my folk music. I'd have been struggling in Hollywood all that time if I hadn't sat down by the river and listened."

River Songs: The message she heard launched Lee on a career of writing, folk music and activism largely aimed at river restoration. She first expressed her love of the Colorado with her recording "Folk Songs of the Colorado River" in 1963. Those songs, written by Lee, and several new ones, have been recently recorded on compact disc in a collection entitled "Colorado River Songs." Lee has also written books on the subject, and frequently appears as a speaker and performer at events to "raise awareness" about how dams and other human activities can destroy natural waterways.

On Sunday, Lee, now 80 years old, showed slides of Glen Canyon before and after the dam, and talked about the cultural history lost when the canyon was flooded to create Lake Powell reservoir.

"A dam is like a blood clot in a human being's artery," Lee said in an interview before the event. "The rivers are the lifeblood of our planet and we've got to let them run. I'm hoping that if people see this beautiful place that was destroyed, they'll see the importance of draining the lake and restoring the river to its natural state."

Proponents of the proposal to drain the lake say the 710-foot high dam, which generates about 1,300 megawatts of hydroelectricity annually, will have to be decommissioned eventually, as erosion and silt put excess pressure on the structure, which proponents say was built on an unsafe foundation of sandstone that will give way over time. The proposal calls for opening the ducts at the bottom of Glen Canyon Dam

and allowing the Colorado River to once again run free. The dam itself would stand in place, a testament, they say, to human folly.

Owen Lammers, director of the Moab-based Glen Canyon Action Network, says draining the lake is the first sensible step in repairing the damage done to the riverways of the region.

Opponents to the plan say draining Lake Powell would destroy local economies in towns such as Page, Ariz., which depend on the reservoir for tourist income. But proponents argue that the tourist economy will survive -- a reservoir-based economy will simply be replaced by an economy devoted to river running.

"It's not about what is more beautiful, an artificial lake to recreate on or a restored river canyon, but that the entire health of the Colorado is in jeopardy because of that dam, particularly the Grand Canyon ecosystem," Lammers said. "The dam is going to have to be decommissioned anyway. The sooner we get started, the sooner we get started on reviving the entire Colorado River."

Vocal Supporter: Over the years, environmental activist David Brower, has been one of the most vocal supporters for draining the lake. Brower, who served 17 years as executive director of the Sierra Club, and remains a member of the board, supported the Glen Canyon Dam in the 1950s as an alternative to a then-proposed dam in the Grand Canyon. But he has spent the last two decades fighting to put the dam out of business.

Brower cites recent studies done by the Glen Canyon Institute, an Arizona-based group that advocates draining Lake Powell, which show that the dam is actually causing the massive loss of water each year through evaporation. That loss -- close to 1 million acre feet annually -- equals six percent of the Colorado River's average annual flow, and is nearly three times the amount of water granted to the state of Nevada through the federally-authorized Colorado River Compact of 1922.

But Brower says one of the best reasons for draining the lake now is to prevent a catastrophe in the future. "We should drain it while we can drain it under control," Brower said in an interview. "If the Glen Canyon dam broke -- and it almost did in 1983 -- most studies show that Lake Mead would go too. You'd have the equivalent of four years of Colorado River water going through in about two weeks. The result would be devastating."

DAM SHAME

For forty years, Arizona's Glen Canyon dam has siphoned the raging Colorado river and laid waste to surrounding territory. Today, it has become the centerpiece of the modern environmental movement. James Ridgeway and Jeffrey St. Clair report.

...Edward Abbey is dead, his books remaining as the inspiration for generations of grassroots environmentalists and a sort of American Western anarchism. The places Abbey loves aren't on any maps. There aren't any people around. They share there wilderness with the mountain lions and the wolves. His characters are loners, outlaws of computerized mass culture. When asked for identification, Abbey's Jack Burns says: "Don't have none. Don't need none. I already know who I am."

We whistled over Waterpocket Fold and across the Escalante canyons and around the Kaiporowits Plateau and there in front of us was Lake Powell and that Glen Canyon dam. Over yonder was the town of Page. We slowed down some and circled around for a minute. I could see Nehi was studying that big plug of cement where the Colorado River used to be. He gives me a hard look. "Garn," he says, "who did that?" "Not me, Mr. Nehi, no sir." He keeps on staring at me. "Honest. Wasn't me. I don't know who done it." He tightens the hammer lock another notch. "I think it was them Government people," I says. He kept on giving me that hard eye. "Them goddamn Government men," I explain. "The Colorado River is a sacred river," he says softly. "Yes, sir," I says. "Weren't none sacreder." Then he roared at me: "And we don't want anybody mucking around with it!" "No, sir." "Is that understood?" "Yes." He stares down at the dam and that long green reservoir behind it. "World's biggest silt trap," he grumbles. "World's biggest evaporation tank. And some day, before it all fills up with mud, it will be the world's biggest sewage lagoon. Let's get out of here." "What do you want us to do about that, Mr. Nehi?" "We will take care of that," he says, cool as a Christian with aces wired.

--Edward Abbey

EVER SINCE EDWARD ABBEY wrote this passage in *The Journey Home*, travelers approaching the Glen Canyon Dam bridge uncomfortably shift in their seats, tighten their belts, half expecting something terrible to happen. As they drive across, they peer down at the great dam and the green artificial lagoon with its armada of motorboats, or stinkpots, backed up waiting for gas, and then plunge on into the little town of Page, known to Abbey followers as "the shithead capital of Arizona."

Today the town of Moab, Abbey's old stomping ground, is the staging camp for a new effort to rip down the Glen Canyon Dam and, beyond that, for taking down a dozen other dams across America and blocking the construction of other big dam structures in other parts of the world. Moab is the headquarters of a movement called the Glen Canyon Action Network, which launched the beginnings of a long-term lobbying campaign aimed at persuading the government to take down Glen Canyon Dam. On March 15, 2000, the network released a declaration endorsed by dozens of green organizations and companies -- an elaborate entreaty for the Bureau of Recreation to

decommission the Glen Dam. This movement, which brings together what's left of the old Abbey gang along with David Brower, the environmental visionary who, more than anyone else, is at the heart of the new drive to save Glen Canyon.

For most of the last century, big dams like the one at Lake Powell were synonymous with progress in taming the frontier. On the Colorado, they meant a sure and cheap supply of water for cities as far away as Phoenix and Los Angeles. They provided recreation for hundreds of thousands of people, electricity that could be shot into the Western grid. Their very existence spelled wealth to the desert states where they were built. But they also brought trouble: Covering up ancient Native American civilization, creating undreamt of pollution in the middle of the desert, uprooting the river-valley population, killing off fish populations, and sounding the death knell for entire ecosystems.

The dam and the gigantic reservoir stretching out behind it for more than a hundred miles -- once referred to by Bureau of Reclamation head Floyd Dominy as a "marvel of mankind" -- have the makings of the world's largest toxic waste dump. Pollution from boats and jet skis equals the amount of oil dumped into Alaskan waters by the Exxon Valdez every ten years. To make matters worse, there is more untreated human shit and urine in Lake Powell than any other body of water in the United States.

SHOOTING OUT OF the Rocky Mountains' alpine snowpack, the Colorado River free-falls fourteen thousand feet in a headlong seventeen-hundred-mile rush to the Sea of Cortez, slashing through the massive sandstone blocks of the Colorado plateau to carve out the most bizarre and spectacular landscape on earth. The first whites (the native people had been living there for ten thousand years) to see Glen Canyon were part of the expedition of Major John Wesley Powell, the crusty one-armed Civil War veteran who floated down the Colorado in a wooden dory in 1869. His detailed description of the canyon and the river is among the most precise and compelling nature writing of the nineteenth century, and was a major influence on both Brower and Abbey. Years later, Abbey would remember his own passage through Glen Canyon as "a voyage like no other in my life, a continuous dream of marvels, wonders, splendors, that has haunted me ever since."

Powell's main purpose was utilitarian -- to map the vast uncharted territories west of the hundredth meridian. His dream was to transform the deserts of the West into agricultural oases where ranching and farming could prosper. Powell's exploration of the western canyons was the beginning of a long-term process aimed at turning the desert into a garden. His mapping provided the basis for a labyrinth of dams, reservoirs, ditches, canals, diversions, and pipelines. In the end, state and federal governments spent \$21.8 billion to siphon off every last drop of Colorado water for urban development and agriculture.

After his return to Washington, Powell pushed for the creation of the Bureau of Reclamation in 1902, the agency created as part of the government's newfound commitment to science. It would become the engine of the Colorado's destruction. But before the Bureau could begin, the competing parties had to settle their differences over

who would get what from divvying up the river. The Colorado and its tributaries slice their way through seven states, and each one demanded a share of the action. Then there were the Indian tribes -- Navajo and Ute, Apache and Havasupai, Hopi and Shoshone, in whose rights to the water are undeniable if almost never realized.

The resolution of these claims and counterclaims to the waters of the Colorado resulted in a thick, convoluted, and constantly evolving docket of regulations, contracts, court rulings, and legislation, known collectively as the "Law of the River." The law comes down to this: first in time, first in right. In other words, the first one to lay claim to water rights gets them. It's called the doctrine of prior appropriation, and it was an invitation to a feeding frenzy. There would be nothing left over. And, in fact, after the dams went up, not even a freshet of the Colorado River would reach the Sea of Cortez. The whole river has been siphoned off.

The first big dam to go up on the Colorado was Hoover in 1935, designed to funnel water to ever-expanding Los Angeles and the fields and ranches of the Imperial Valley. The Glen Canyon Dam came into being because the upper-basin states of Colorado, Wyoming, Utah, and New Mexico wanted to insure the portion of the Colorado River allotted to them under the compact wouldn't be siphoned off by others, and, since the government had misjudged the total annual rainfall, the best way to do that would be to create a reservoir. Environmentalists opposed the dam, but eventually gave in, hoping that in agreeing to a dam at Glen Canyon they could avert others going up in northern Utah. Brower played a key role in these deals, culminating, in 1962, in construction of the dam, which stands 710 feet tall, averages 560 feet deep, and floods Glen Canyon for 180 miles upstream, transforming into Lake Powell, the second-largest man-made reservoir in the Western Hemisphere.

THE DAM NEVER SEEMS to have accomplished what it set out to do. "Some very good clear-thinking people have concluded that Glen Canyon Dam was built in a wrong and dangerous place," says Brower. Today, eighty-seven and battling cancer, Brower has returned to the Colorado to lead a movement aimed at dismantling the Glen Canyon dam. "The law of diminishing returns was right, that it wastes water we cannot afford to lose, pollutes the river in ways we failed to consider, is extremely vulnerable to engineering and economic disaster, is not needed, and indeed defeats the purpose for which it was intended. Moreover, it has lost the world one of its most beautiful places, and can be restored at a fraction of the cost of not restoring it."

The dam was supposed to generate cheap electricity to power the West. Right now, the Glen Canyon Dam generates thirteen hundred megawatts of electricity, enough power for about thirty-five thousand homes, but there is currently a power surplus on the Colorado plateau with more units going into production than can be used. It was meant to store water. But the river itself, running free, can hold amounts equal to the twenty-seven million acre-feet that now sit in the reservoir behind the dam, and, if allowed to run free, the river would add one and a half million acre-feet now lost to evaporation and seeping into the Navajo sandstone that undergirds the reservoir.

Recreation, which was not the primary purpose in building the dam, is considered a major benefit, as the lake attracts two and a half million people annually. But at what cost? The sewage and petroleum pollution in Lake Powell trickles down into the Grand Canyon itself. Half the native fish population in the Grand Canyon has been destroyed, and declines continue as a result of the cooler water and lack of sediment brought on by the dam. The riparian habitat in the Grand Canyon has also changed dramatically, with invasive species taking over the native ecosystem.

The construction of a dam and its reservoir is also the story of the dislocation of people and history. "We were promised everything," says Thomas Morris, head of the Navajo's Medicine Men Association. "We were promised water, power, and money. It never came. We were promised that the dam wouldn't flood our sacred land at Rainbow Bridge. It did." Rainbow Bridge, the planet's largest natural bridge, was ostensibly protected by the bill that authorized construction of Glen Canyon Dam. But the Bureau of Reclamation violated the agreement, and the waters lapped to the very edge of the sandstone arch. The flooding of the Indian sites is viewed as an act of cultural genocide by traditionalists such as Morris. "All of Glen Canyon is a holy place," says Morris. "Many Dineh people may not know how to read English, but they know how to read the symbols on the walls of the canyon. They tell a story, a prayer, a healing ceremony. Now those stories are lost."

Page, Arizona, is a dusty eyesore of a city, splattered on the rim of Glen Canyon. The land that Page sits on was once part of the sprawling Navajo Reservation, the Big Rez. And before that, the canyonland country was the redoubt of the mysterious Anasazi, who lived in magnificent cliff-hugging palaces and left petroglyphs and pottery scattered across the region before they disappeared in the fifteenth century. When Glen Canyon Dam went up, thousands of Anasazi sites were flooded.

IN THE UNITED STATES ALONE, there are nearly 75,000 dams. That translates to the construction of one dam every day since the signing of the Declaration of Independence. Those dams inundate 600,000 miles of river. Only a precious handful of rivers have escaped having some kind of a dam impede their flow. Worldwide, there are an estimated 850,000 small dams, forty thousand of them on what are considered to be large rivers. The rationale for many of these needs to be rethought. In China, the mammoth Three Gorges project, which will construct the world's largest dam on the Yangtze River, will require the removal of more than two million people and will flood cities the size of Portland, Oregon. Another potential fiasco, the dam project underway in Bolivia's new Medidi National Park, threatens to drown out one of the most dense and diverse ecosystems in the world.

The movement to remove big dams and restore rivers is picking up steam. It has a supporter in Secretary of Interior Bruce Babbitt, who led a "sledgehammer" tour in 1998 to several dams that he wanted to see brought down. "Usually my trips to rivers involve a canoe and paddle, or fly-fishing rod and reel," Babbitt said in a 1998 speech. "More recently, I arrive with sledgehammer in hand to celebrate the destruction of dams."

Babbitt is one of a few hundred people who have floated the Colorado through Glen Canyon. "I hiked and boated and camped beside the Colorado River before Glen Canyon dam was built in the 1960s," Babbitt said. "In those years, it was a wild, unpredictable, brown sediment-laden stream flooding into the early summer, then settling down in the winter. The gates of Glen Canyon were closed in 1963. Today, you see an ice-cold, Jell-O-green river, manipulated up and down, rising and falling on a daily scale, flushed with the regularity and predictability of a giant toilet." But Babbitt's rhetoric often outstrips his action. His has been a cautious, tentative tenure at Interior. Several smaller, decrepit dams have come down during the Clinton administration, and Babbitt has singled out a few other noncontroversial dams for decommissioning. Among the targets are two dams on the Elwah River inside of Olympic National Park, which annihilated one of the world's most productive salmon fisheries, abridging an 1855 treaty with the S'Klallam tribe that gave them salmon fishing rights "in perpetuity." The dams have long outlived their function, and an agreement was reached in 1992 to bring them down. But Congress has yet to fund their breaching.

On Glen Canyon, and the other big, contentious dams, Babbitt has stood mute, even as his own biologists have put their careers on the line in an effort to save rare fish species driven to near extinction by big dams. The real economic stakes are up in the Northwest, where four dams along the Idaho/Oregon border on the Snake River have been targeted for removal as salmon-killers by environmentalists and federal biologists. These four dams were built by the U.S. Army Corps of Engineers between 1962 and 1975. Each is about 100 feet high and generates 1,230 megawatts of cheap hydropower, much of which is sucked up at below-market rates by the aluminum factories and pulp mills that line the Snake and Columbia Rivers. When the dams went up, salmon and steelhead (a sea-going trout) stocks crashed, declining by more than ninety percent. The alternative is fairly clear cut: either remove the dams or lose the fish. "It is painfully obvious that twenty years of technological fixes have not overcome the problems caused by the four lower Snake River dams," said Dr. Richard Behnke, a professor of fisheries at Colorado State University. "Either we change course now and restore the lower Snake to a semblance of a river, or we will likely lose forever a unique and precious genetic resource that can't be replaced."

But the subject of removing these dams is politically radioactive. George W. Bush wasted little time getting his position out. On his first swing through the Northwest in the summer of 1999, he pledged to get the dams in operation if elected. Gore has shied away from the subject, failing to back up both the EPA and the Fish and Wildlife Service, which have called for the removal of the dams. In fact, the White House has now said a decision on the fate of the dams will be delayed until after the election.

So far, only two prominent elected officials have called for the dams to come down, Oregon governor John Kitzhaber and New Mexico congressman Tom Udall, the son of Stewart Udall, former Secretary of the Interior. Udall wrote a strongly worded letter to President Clinton urging him to take action on the Snake River dams. "What is needed now is decisive action rather than further study," Udall wrote Clinton in a March 2, 2000, letter. "Our lack of action today will allow the salmon to move closer to extinction. While removing the dams is only one piece of a larger solution, it is the first step to effectively

restoring the salmon in the lower Snake River. It is an action that makes sense for the ecosystem, the economy and the nations and tribes with whom we have treaty obligations." However, Udall has remained quiet on Glen Canyon, the dam in his own backyard.

WHAT BROWER AND THE OTHERS gathered at Moab hope to do is to begin a long educational campaign aimed at convincing the public that taking the dam down is better than leaving it up. The process of tearing it down would be gradual, with the underwater Atlantis slowly reemerging. It seems likely that their steady conviction, along with mountains of supporting evidence, will get the job done over time, but you can't help but long for more sudden action -- something like what happened in 1983, when Glen Canyon Dam nearly overtopped and experienced a near catastrophic failure of its spillway tunnels.

While officials in Washington declared their confidence in the structure, a twinge of excitement raced through Abbey's river-rat community. The loners, a few outlaw park rangers, the Forest Service sentinels atop their fire stations, the former Vietnam pilots ferrying tourists through the canyons in small planes, Indochina medics working the rafts, the young girl guides -- the whole Monkey Wrench gang -- paused to recall the words of the prophet Nehi, and they began to look around themselves with renewed interest in the tiny side canyons off the Colorado into which they might scurry were the Glen to let go. There was a moment of silent exultation that those bastards in Washington just might get theirs.

An engineer atop the dam told a visiting reporter that if the water went another foot higher, he'd "run like hell." Off in the distance of the great desert, the coyotes howled and the turkey vultures circled. Down below, at the huge Hoover Dam there was a shudder among the second-string bureaucrats all dressed up in their neat little duds. If the Glen went, what would happen when that wall of water hit Hoover? "We came close to losing the dam in June 1983," Brower recalled tactfully. "A big water year, but by no means the biggest. Major damage was incurred when the dam exceeded its capacity. It will exceed its capacity more often, and waste more water, as the reservoir fills with sediment. The Bureau of Rec was initially concerned about the dam site, but built Glen Canyon there anyway. If Glen fails when full, Hoover will fail, too. If so, four years full flow of the Colorado River will head for the Sea of Cortez in a few hours. The only good news is that Tucson would no longer have to worry about the poor quality of its Colorado River water. And this could happen by accident, as it almost did in 1983. Or, as every thinking person must be aware, by intent."

Abbey's best known book, *The Monkey Wrench Gang*, which plots the destruction of the Glen Canyon Dam by a group of environmental saboteurs, begins with a line from the poet Richard Shelton: "But oh my desert/ yours is the only death I cannot bear." For the river rat, those words are a call to arms. As Thoreau put it: "Now. Or never." Abbey himself had a more straightforward proposal: "Some unknown hero with a rucksack full of dynamite will descend into the bowels of the dam; there he will hide his high explosives where they'll do the most good, attach blasting caps to the lot and with

angelic ingenuity... ignite the loveliest explosion ever seen by man, reducing the great dam to a heap of rubble in the path of the river."

Important Opportunity To Promote Green River Restoration

Contacts: Owen Lammers or David Orr: (435) 259-1063

The US Bureau of Reclamation is seeking public comment on the operation of Flaming Gorge Dam (on Utah's Green River). A series of public meetings in mid-July provides important opportunities for citizens to participate in protecting and restoring our endangered native fish.

HERE'S WHAT YOU CAN DO:

1. ATTEND one or more of the public meetings
2. SPEAK OUT for river restoration
3. SUBMIT WRITTEN COMMENTS by September 5

ATTEND:

Meetings will be held from 6-9 PM in the following locations: - Salt Lake City, UT (7/11, Wyndham Hotel--215 W. S. Temple) - Rock Springs, WY (7/12, Holiday Inn--1675 Sunset Dr, I-80 Exit 102) - Grand Junction, CO (7/13, AdamsMark Hotel--743 Horizon Dr, I-70 Exit 31) - Vernal, UT (7/18, Western Park Conv Ctr--300E 200S) - Fort Duchesne, UT (7/19, Ute Tribal Headquarters--988S 7500E)

SPEAK OUT:

Join the call for a comprehensive environmental impact statement (EIS) on the Colorado River watershed, including studies on decommissioning--breaching or removing--dams which harm endangered species. Background information is provided below.

SUBMIT WRITTEN COMMENTS TO:

Mr. Kerry Schwartz Environmental Protection Specialist Bureau of Reclamation 302 East 1860 South Provo, UT 84606-7317 Telephone (801) 379-1167 Fax (801) 379-1159 Email: Kschwartz@uc.usbr.gov

This is a rare and important opportunity for citizens to provide input on the operation of a major federal dam. Please write to the Bureau with your comments, especially if you are unable to attend any of the public meetings.

The Endangered Species Act requires the Bureau to change the operations of Flaming Gorge Dam to reduce the harm caused to endangered fish. Dams, including Flaming Gorge Dam, damage or eliminate the habitat conditions these fish require. Conservationists are asking the Bureau to study a dam decommissioning alternative, and to look not just at Flaming Gorge but at the entire Colorado River watershed to address the recovery needs for the endangered species.

Some key points you may wish to include in your letter are listed below, along with some background material. If you have questions, please contact:

Glen Canyon Action Network PO Box 466 Moab, UT 84532 Phone: 435-259-1063 Fax: 435-259-7612 Email: info@drainit.org

Please check back over the next two weeks for additional information which you can incorporate into your comments.

JOIN OTHER CITIZENS AND GROUPS IN ASKING FOR:

* Conducting a programmatic EIS for endangered fish recovery throughout the Colorado River watershed, including the Green River and San Juan River basins; * Preparing a basinwide endangered fish recovery plan that considers alternatives to dams; * Evaluating one or more decommissioning alternatives in the EIS for Flaming Gorge and other dams including Navajo Dam on the San Juan River and Glen Canyon on the Colorado River; * Removing non-native fish which prey on endangered fish; * Limiting withdrawals of water from the river basin to ensure adequate streamflows for fish recovery throughout the basin; and * Protecting and restoring the Green River downstream of the dam, especially through historic Dinosaur National Monument.

BACKGROUND:

The government is preparing an Environmental Impact Statement (EIS) to address Flaming Gorge Dam's impact on endangered species of native fish.

Four species of fish native to the Colorado River watershed (including the Green River) are protected by the federal Endangered Species Act. The humpback chub, Colorado pikeminnow, bonytail chub, and razorback sucker have lost much of their habitat and are now on the brink of extinction primarily as a result of the construction of dams and reservoirs throughout the Colorado River watershed.

Another factor in the decline of these species is the introduction of non-native "game" fish (including trout, catfish, and striped bass) which are known to prey on endangered fish. For years, the government has promoted sport fisheries at the expense of native fish. In the Green River, the government has fostered a trout fishery below Flaming Gorge Dam to the detriment of native fish.

A third factor known to harm native fish is the diversion of water from the river. This problem is especially acute in the lower Colorado River, where the entire river's flow is diverted, primarily for inefficient agricultural irrigation. Diversion is an issue in the Green River, where the Central Utah Project withdraws water for agriculture and industrial use in faraway western Utah.

The Green River flows through Dinosaur National Monument below Flaming Gorge Dam. Dam operations issues, including water outflow temperatures, sediment transport, and dam safety concerns, must be addressed to ensure protection of this unique and historic unit of America's national park system.

Flaming Gorge Dam and other dams on the Colorado River, Green River, and San Juan River, contribute to the decline and extirpation of native fish by causing loss of habitat in the areas inundated by the reservoirs, and by changes in downstream conditions including temperature, changes in turbidity, and other factors. Despite the government's knowledge of these facts, there has not been any consideration given to decommissioning dams as a rational approach to recovering the native fish. Instead, the government has chosen to look at each river segment and each isolated fish population separately as if the dams were permanent, immovable fixtures. By focusing on pieces of the system (e.g., a single dam) rather than the entire Colorado River basin, important issues and solutions are easily overlooked.

The current round of public meetings will identify issues important in addressing the recovery of endangered species for the EIS. To be scientifically credible and legally defensible, the EIS must address a range of alternatives that utilize the best available scientific information to achieve recovery.

A copy of the Federal Register notice and other published documents relating to this EIS may be found on the Bureau's website at: www.uc.usbr.gov. US Fish & Wildlife Service operates a website with information on the endangered species recovery plan at: www.r6.fws.gov/coloradriver/.

Thank you for your interest in restoring the Colorado River. We look forward to seeing you at the public meetings!

Study May Open the Floodgates Of Debate on Flaming Gorge Dam

BY BRENT ISRAELSEN for Salt Lake Tribune

By now it is no secret that some activists want to drain Lake Powell.

Expect a similar call this week for Flaming Gorge Reservoir.

Beginning Tuesday, Flaming Gorge Dam will be the focus of renewed public debate as the U.S. Bureau of Reclamation seeks public comment on dam operations.

The bureau is preparing an environmental impact statement (EIS) to detail the effects of operating the dam in a way to benefit the razorback sucker, the Colorado pikeminnow, the humpback chub and the bonytail chub -- the four endangered fish of the Upper Colorado River Basin.

A handful of environmental groups will suggest a more dramatic alternative: Drain the reservoir and allow the Green River to flow freely again.

"It's well known that the endangered fish . . . are endangered in part by construction of dams and reservoirs. It seems a logical thing to consider decommissioning the dam," said David Orr, spokesman for the Glen Canyon Action Network. The Moab-based network's main goal is to drain Lake Powell, the reservoir behind Glen Canyon Dam at the Arizona-Utah border.

But just as the bureau is not considering draining Lake Powell, neither will it consider draining Flaming Gorge, said Kerry Schwartz, who is leading the Flaming Gorge EIS team.

"Decommissioning of [Flaming Gorge] dam is not within the scope of this project," said Schwartz.

The EIS project is to analyze only the environmental and social impacts of operating the dam to achieve flows recommended by the Recovery Implementation Program for Endangered Fish in the Upper Colorado River Basin. The program is an effort by Utah, Colorado and Wyoming to boost fish numbers and improve fish habitat, with the ultimate goal of removing the fishes from the federal endangered species list.

The recommendations call for the dam to modify its releases so the flows in the river below the dam would more closely mimic the natural hydrologic conditions of the river, thus assisting the fish in their reproduction and growth.

Shwartz pointed out the EIS's purpose is not to explore ways to maximize all the river's natural resources.

Orr said that approach is shortsighted and symptomatic of the "piecemeal" way the government is managing the greater Colorado River Basin, where hundreds of dams and diversions have significantly altered ecosystems.

"We would like the Bureau of Reclamation to become the Bureau of Restoration," Orr said. "Put the engineers to work on a crash course to fix the problems that have been caused by a half century of water development in the basin."

In the case of Flaming Gorge Dam, it is a small miracle the bureau is doing even a narrowly focused EIS.

Jack Schmidt, a Utah State University researcher who has made a career of studying the impacts of Flaming Gorge Dam on downstream ecosystems, said there were some officials in the bureau who did not believe an EIS was necessary for the new flow

recommendations. Others feared an EIS would risk "opening up a Pandora's box they wished they would never had opened," Schmidt said.

"But the reality is it is a Pandora's box. It's an incredibly complex and serious issue," he said. "Now that it is open, they are not going to get it closed."

It is complex because of the numerous and competing interests on the river. While the dam has hurt native fish, it has created a world-class trout fishery in the 15-mile stretch of river below the dam. Though the dam's unnatural flows have altered the natural environment of Dinosaur National Monument, its flood-control capabilities have benefited farmers further downstream. And the dam's electrical generating output cannot be ignored either.

Still, Schmidt believes that if an environmental impact study were ever conducted throughout the Colorado River Basin, the justification for keeping Flaming Gorge Dam, which has affected the river's ecosystems as far south as the town of Green River, would be "weak."

Scoping Comments on EIS for Flaming Gorge Dam

Mr. Kerry Schwartz
Environmental Protection Specialist
US Bureau of Reclamation
302 East 1860 South
Provo, UT 84606-7317
[Link to Biological Opinion of Flaming Gorge Dam](#)

RE: Scoping Comments on EIS for Flaming Gorge Dam

Dear Mr. Schwartz:

We appreciate this opportunity to submit the following scoping comments on the proposed Environmental Impact Statement (EIS) for Flaming Gorge Dam. Our organizations collectively represent thousands of individuals from across the United States with an interest in the future of the endangered native fish species and ecological communities of the Colorado River basin, including the Green River.

We wish to thank the Bureau of Reclamation (Bureau) for recognizing the seriousness of the plight of the four endangered native fish of the Colorado River basin: the Colorado pikeminnow (*Ptychocheilus lucius*), Razorback sucker (*Xyrauchen texanus*), Bonytail (*Gila elegans*), and Humpback chub (*Gila cypha*).

There is wide agreement within the scientific community that dams in the Colorado River basin, including Flaming Gorge Dam on the Green River, contribute significantly to

the degradation of riverine habitat necessary for the survival and flourishing of these species. As builder and operator of many of these structures, the Bureau has a special responsibility to address issues related to the decline and potential extinction of these four federally-listed species.

We understand that the Bureau is undertaking this EIS in response to proposed flow criteria established by the Upper Colorado River Endangered Fish Recovery Program (UCREFRP) pursuant to consultation with the US Fish & Wildlife Service under Section 7 of the Endangered Species Act (ESA). The Bureau is required to consider in an EIS, under the National Environmental Policy Act (NEPA), a range of alternatives that reasonably and practically fulfill the purpose and need of the proposed government action.

In our comments below we address some of the considerations necessary for a comprehensive EIS, including:

- Issues pertaining to the current operation of Flaming Gorge Dam and Reservoir;
- Critical areas of analysis, including the need to incorporate decommissioning as a potential alternative; and
- Issues demonstrating the need for the Bureau to undertake a programmatic EIS for endangered species recovery for its activities throughout the Colorado River watershed.

I. FLAMING GORGE DAM OPERATIONAL ISSUES

A. Endangered Fish

The operation of Flaming Gorge Dam has been known for many years to cause harm to native fish. The introduction of a successful fishery for non-native trout in the dam's tailwaters is testament to the conditions existing downstream of the dam that make the river inhospitable for native species which require warmer water for successful spawning and survival. The reservoir traps vital sediments behind the dam, thereby preventing replenishment of the silt, sand and other material, which are gradually eroded and transported downstream. The dam, which has no fish passage structure, forms a reservoir which is used and managed for a recreational sport fishery for several non-native species known to prey on endangered natives. Conditions are marginal at best for endangered fish survival in the reservoir and downstream environments created by Flaming Gorge Dam.

B. Water Supply

Flaming Gorge Dam is operated as a water storage facility, part of the Colorado River Storage Project which includes Glen Canyon Dam on the Colorado River in Arizona, Navajo Dam on the San Juan River in New Mexico, the Aspinall Unit Dams on the Gunnison River in Colorado, and others. The Upper Colorado River Endangered Fish Recovery Program goals, as stated, include providing for "future water development" (emphasis added). Presently Flaming Gorge Dam provides little if any water for consumptive use; it is designed and operated primarily as a storage dam to regulate

flows for downstream users. This regulatory function is not critical to the functioning of the region's water supply system. Evaporation can be significant, especially in warmer months, resulting in less water available for downstream uses. Furthermore, water conservation, not development, must become the Bureau's strategy for meeting future supply needs. Overall, we find Flaming Gorge Dam's role for water supply purposes not sufficiently significant relative to the facility's impacts on endangered species and the alternatives available to fulfill its water supply uses.

C. Hydroelectric Power Generation

Flaming Gorge Dam was designed to produce hydroelectricity incidental to the primary function of water storage and flow regulation. The maximum output of 150 megawatts is a small portion of the region's overall generating capacity. Moreover, given that the maximum output of Glen Canyon Dam was recently cut by approximately 500 megawatts—in effect eliminating more than three times the capacity of Flaming Gorge, its loss would be relatively insignificant and could be made up through implementation of energy conservation techniques and demand management.

D. Recreation and Flood Control Issues

The dam provides a locally important recreation industry centered primarily on sportfishing and motorboating. As noted in I.A. above and II.B. below, the introduction of non-native species to support sportfishing has impacted native endangered species. Motorboats, especially personal watercraft, contribute to water quality problems that also need to be taken into account.

The dam is not authorized to serve a flood control function, but can be operated in that capacity. However, the risk of significant damage from downstream flooding is minimal, and with implementation of floodplain management techniques, what little risk exists could be further reduced.

E. Flaming Gorge Dam and the Colorado River Basin

As noted in I.B. above, Flaming Gorge Dam is a unit of the Colorado River Storage Project. In addition to the CRSP dams in the upper basin, an extensive system of dams exists in the lower basin, including Hoover Dam on the Nevada-Arizona border, and several smaller yet important water supply dams on the river between California and Arizona. The river exits the United States (and indeed, the riverbed itself!) south of Yuma, Arizona, where the once-vibrant Colorado River delta ecosystem has been decimated, converted into an alkali flat polluted by agricultural pesticide and fertilizer runoff.

Water delivery contracts for the Upper Basin are structured pursuant to the Upper Colorado River Basin Compact. The compact has never been subjected to NEPA analysis.

Contracts for the lower basin are subject to allocation by the Secretary of the Interior, pursuant to the terms of the Colorado River Compact (passed into law as the Boulder Canyon Project Act in 1928), which led to implementation of basinwide water planning

and allocation ever since. Thus the operations of Flaming Gorge Dam are integrally connected to the operations of the CRSP, the Upper Basin Compact, and the Colorado River Compact/Boulder Canyon Project Act. Therefore its impacts are also tied to this larger system, and as described in item III. below, must be appropriately addressed.

II. CRITICAL AREAS OF ANALYSIS TO BE ADDRESSED IN THE EIS

A. Effects of Dam Operation on Dinosaur National Monument

The Bureau must consider the effects of Flaming Gorge Dam operations on Dinosaur National Monument downstream of the dam. The National Park Service is required by the National Park Service Organic Act to protect the Monument's natural features, ecological communities, streams, and native species, and to leave them unimpaired for future generations.

Flaming Gorge Dam has caused many documented negative effects on the Green River ecosystem downstream of the dam and in the Monument. For example, the dam's cold water releases have for years impaired the native fish stocks in Dinosaur. In addition, the absence of floods and sediment has negatively affected stream morphology characteristics important for native fishes.

Alternatives presented in the EIS must ensure compliance with National Park Service laws and regulations that provide for protecting the Green River ecosystem and its native fish. The Bureau should analyze each alternative in light of expected effects on Dinosaur's natural features and aquatic communities, especially on listed endangered species, sensitive species, and species of special concern. The EIS should explain in detail the impacts of the dam's past and present operations on Dinosaur, and show how future operations will impact park resources and natural regimes of sediment transport and distribution, depositional patterns, streamflow, temperature, riparian ecosystems, native plant communities, and native fish populations within the Monument. Finally, the EIS should explain in detail how Flaming Gorge Dam operations will be managed so as to ensure compliance with the nonimpairment provision of the Organic Act.

B. Removal of Non-Native Fish Which Prey on Endangered Fish

For years the state and federal governments have operated Flaming Gorge Dam and Reservoir and other dams in the Colorado River basin to promote and enhance sportfisheries and related recreation activities. In the reservoirs and downstream in the tailwaters, government policies have increased the numbers and habitat conditions suitable for non-native species such as trout which are known to prey in significant numbers on endangered native species. The Bureau must address the detrimental effects on endangered fish species, sensitive species, and species of special concern, caused by non-native species, and provide alternatives in the EIS that eliminates such predation, both in the reservoir and in the tailwaters.

C. Endangered Species Recovery Needs at the Species Level

The extensive system of dams and diversions throughout the Colorado River basin fragments and artificially isolates endangered fish populations. Historically, regulators

have responded to declining populations of these species by attempting to formulate management criteria that fail to question the fundamental circumstances contributing to the endangerment in the first place. The US Fish & Wildlife Service and the Bureau have chosen to address endangered fish recovery by first declaring isolated populations to be distinct, then proposing recovery plans which fail to address the factors causing the isolation in the first place.

Some or all of the endangered Colorado River fish species are known to be migratory. In addition, evidence exists that the interruption of fish migration by construction of dams in the basin has had a detrimental effect on fish recovery. Within the EIS, the Bureau must evaluate the potential effects, including genetic health and reproductive success, on recovery of fish, including listed endangered species, sensitive species, and species of special concern, that are no longer isolated between dams.

D. Water Quality and Recreational Impacts

In recent years, a rapid rise in recreational use of motorized watercraft including personal watercraft (PWC) has resulted in increases of petroleum effluent in reservoirs and streams. In particular, the proliferation of two-cycle PWCs has resulted in dramatic increases of oil and gasoline discharges into water bodies such as Flaming Gorge Reservoir. The EIS must quantify current and future trends in petroleum discharges from recreational watercraft, and address the potential impacts of these compounds (including MTBE) on native endangered fish species. The EIS should analyze one or more alternatives that consider the effects of declining water quality on listed endangered species, sensitive species, and species of special concern. Finally, the EIS should consider alternatives which implement greater restrictions or outright prohibitions on PWCs, other two-cycle motorized watercraft, and other polluting machinery.

E. Dam Decommissioning Alternative

The Bureau should incorporate into its EIS alternatives which evaluate the potential for decommissioning (e.g., breaching, removing, or disabling) Flaming Gorge Dam and allowing the Green River to flow freely once again. Decommissioning is the most ecologically effective and economically efficient alternative for addressing the purpose and need of the EIS, namely recovering endangered native fish species. Some negative impacts of dams cannot be adequately mitigated, e.g. loss of sediment deposition downstream of the dam, and reduction of frequency and intensity of flood events. And as attempts to do so become more costly, complicated and ineffective, agencies such as the Federal Energy Regulatory Commission and the Army Corps of Engineers are now turning to decommissioning as a preferred alternative for habitat restoration and species recovery. The Bureau should also consider decommissioning alternatives amongst its recovery options.

The Bureau is obliged to consider a decommissioning alternative even if the implementation of such an alternative would be beyond the scope of the agency's discretion, so long as it is reasonable and practical.

36 CFR 219.12(f)(5). Reasonable alternatives which may require a change in existing law or policy to implement shall be formulated if necessary to address a major public issue, management concern, or resource opportunity identified during the planning process.

40 CFR 1502.14(a-c). Alternatives including the proposed action. This section is the heart of the environmental impact statement. ... In this section agencies shall:

(a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.

(b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.

(c) Include reasonable alternatives not within the jurisdiction of the lead agency. ...

The Council on Environmental Quality (CEQ) addresses this question in the following excerpt from its "Forty Most Asked Questions Concerning CEQ's NEPA Regulations, 23 March 1981":

Question 2a. Alternatives Outside the Capability of Applicant or Jurisdiction of Agency. If an EIS is prepared in connection with an application for a permit or other federal approval, must the EIS rigorously analyze and discuss alternatives that are outside the capability of the applicant or can it be limited to reasonable alternatives that can be carried out by the applicant?

Answer. Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.

Question 2b. Must the EIS analyze alternatives outside the jurisdiction or capability of the agency or beyond what Congress has authorized?

Answer. An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable. A potential conflict with local or federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Section 1506.2(d). Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying the Congressional approval or funding in light of NEPA's goals and policies. Section 1500.1(a).

Given the increasing attention other federal and state agencies are not only paying to the examination of decommissioning alternatives, but selecting them as the preferred alternative, such an alternative in the case of Flaming Gorge does meet the definition of "reasonable" and "practical" under NEPA.

III. PERFORM A PROGRAMMATIC EIS ON COLORADO RIVER BASIN DAM OPERATIONS AND WATER MANAGEMENT

Problems facing Colorado River endangered fish on the Green River and elsewhere in the basin are not likely to be solved solely by addressing impacts associated with Flaming Gorge Dam. Federal policy has too often chosen to view isolated, remnant populations of endangered fish as if they were and always will be isolated, ignoring the purpose and goals of the ESA--to restore viable, healthy populations throughout the species' range. The problems that lead to fish endangerment are not easily resolved at the micro (individual dam) level and must also be addressed from a watershed perspective.

The Bureau is currently engaged in a number of projects, studies, and current and potential litigation that collectively have and will continue to have a significant cumulative impact on these endangered species, including:

1. Lower Colorado River Multiple Species Conservation Plan (LCRMSCP) for endangered fish and wildlife;
2. Adaptive Management Program for Glen Canyon Dam operations pursuant to the Grand Canyon Protection Act;
3. Upper Colorado River Endangered Fish Recovery Program for endangered fish;
4. Draft EIS for the Animas-La Plata project (San Juan River basin) in southwestern Colorado;
5. Draft EIS for Navajo Dam (San Juan River) operations;
6. Draft EIS for new Central Arizona Project water allocations;
7. Draft EIS/EIR for Salton Sea restoration in California;
8. Draft Programmatic EIS for the Rio Grande River (potential withdrawals of San Juan River water via San Juan-Chama Diversion project);
9. Draft EIS for Colorado River Interim "Surplus Criteria" for additional withdrawals;
10. Offstream storage of Colorado River water especially in the lower basin;
11. Continued and expanding depletions by transmountain diversions to the Front Range in Colorado from the headwaters of the Colorado River;
12. Current consultation on reoperation of the Aspinall Unit on the Gunnison River in Colorado that will lead to DEIS;
13. At least three proposals for new pipelines which would withdraw water from Navajo Reservoir and Lake Powell Reservoir;
14. Proposed settlement of Little Colorado River basin water rights in Arizona and New Mexico;

15. Price-Stubb Diversion Dam relicensing in Colorado;
16. Virgin River Resource Management & Recovery Program;
17. Current litigation against the Bureau for failing to address endangered species needs in the Colorado River delta and Gulf of California; and
18. Potential litigation by Indian tribes, seeking additional water rights or quantification of existing rights.

Council on Environmental Quality regulations require the Bureau to address those ongoing agency actions that relate to the proposed action. Since there are numerous NEPA actions underway within the Colorado River watershed which affect water use and allocation and endangered species management, the Bureau must therefore discuss and consider in the context of the Flaming Gorge Dam EIS these other actions. 40 CFR 1501.7(a)(5). Furthermore, even if the impacts of each of these actions are to be analyzed separately, they still must be tiered to a larger programmatic EIS. 40 CFR 1508.28, 1502.20.

It is unclear whether the Bureau can adequately address long-term needs of the fish throughout the basin in the context of these individual projects. It is also unclear how the Bureau will ensure that the cumulative impacts of all these efforts will work together to guarantee, and not impede, recovery.

In addition, there is a transbasin issue linking the Colorado River basin with the Rio Grande River basin. The San Juan-Chama project diverts water from the San Juan River (Colorado River basin) into the Chama River (Rio Grande River basin). Current proposals being voiced in New Mexico call for potential future increases in diversions of San Juan River water to supply Rio Grande municipal and agricultural water users as far away as Albuquerque and the middle Rio Grande irrigation project.

The Upper Colorado River Basin Compact has had a profound effect on the management, use, and allocation of water in the upper basin, including the Green River. The compact controls all river operations, facility operations, and contracts. In the context of this EIS, the Bureau must look at alternative ways to implement the compact in order to minimize effects on aquatic ecosystems, including endangered native fish species, sensitive species, and species of special concern, and to ensure compliance with water quality regulations under the Clean Water Act. Given the constraints of the compact, the Bureau must also consider modifications or changes to the compact that would contribute to the recovery of the affected endangered species, other sensitive species and species of concern, and achieve the purpose and need of the proposed action. As discussed in II.E. above, the Bureau is not constrained by existing laws or contracts in formulating and evaluating alternatives.

Given the extensive amount of federal activity within the Colorado River watershed, much of which directly addresses and/or affects endangered species, a comprehensive programmatic EIS covering the entire basin is not only warranted but also sorely needed. This approach is not unprecedented. The Bureau recently began scoping for a

programmatic EIS on Upper Rio Grande River operations to address impacts of water diversions on endangered species. A programmatic EIS for the Colorado River basin would provide for the multitude of issues affecting endangered species to be addressed in a comprehensive fashion, and would complement the effort now under way in the Rio Grande basin. And as outlined in II.E above, such an EIS must evaluate dam decommissioning as an alternative.

The Bureau's operations of its dam and water diversion systems on the Colorado River have had massive and far-reaching environmental impacts, yet have never been the subject of an EIS. Were such an EIS to exist, it would inform the Bureau, other federal agencies, states, tribes, and the public on all aspects of the Bureau's operations and its "off-river" impacts from the continuing urbanization in the basin states that is able to occur only because of the continued supply of water, or at least the expectation of a continued supply of water, from the Colorado River.

While the construction of the dam system predated the passage of NEPA, the operations and management of the river have changed dramatically since Flaming Gorge and other dams were built—substantial activity which can no longer be considered "grandfathered in" under NEPA. Such actions include the transfer of water from Imperial Irrigation District (IID) to San Diego, the development of off-stream banking, major increases in water consumption, additional water diversions, and the uses of the water diversions and supplies. These changes have altered the character and impact of river management to the extent that now any Bureau activities must trigger a NEPA process. "[When] an ongoing project undergoes changes which themselves amount to "major federal actions, the operating agency must prepare an EIS." *Upper Snake River v. Hodel*, 921 F.2d 232, 235 (9th Cir. 1990); see *Andrus v. Sierra Club*, 442 US 347, 363 n.21 (1979).

As a result, the present NEPA analysis will need to be much more comprehensive in order to compensate for the lack of pre-existing NEPA analysis and baseline information. Note here that the environmental baseline of NEPA encompasses impacts to additional aspects of the human environment -- socioeconomic, environmental justice, recreation, cultural resources, wildlife and its habitat for non-sensitive species, air and water pollution -- not included in the ESA environmental baseline of impacts to endangered species and critical habitat. The action to be analyzed in the scoping notice, as well as the new actions mentioned above, would require changes in operations which have never been analyzed in the first place.

In conclusion, we find the Bureau's initiative to address endangered fish below Flaming Gorge Dam an important exercise. However, we fear that unless the Bureau approaches this undertaking in the full spirit contained within the ESA and NEPA, that such an effort will be unable to guarantee species recovery. We have outlined assessment methodologies above that we believe will avoid such an eventuality, and look forward to working with the Bureau and other relevant agencies to ensure their appropriate incorporation into the current EIS process for Flaming Gorge Dam.

Thank you for the opportunity to submit these comments and recommendations, and we look forward to your reply.

Sincerely, John S. Weisheit President Glen Canyon Action Network

Coalition questions Colorado River dams and diversions

GLEN CANYON ACTION NETWORK MEDIA ADVISORY

FOR IMMEDIATE RELEASE Tuesday, July 11, 2000

CONTACTS: Owen Lammers or David Orr, GCAN (435)259-1063 (435)260-2591 (mobile)

Brian Dunkiel, Friends of the Earth (802)951-9094

Kara Gillon, Defenders of Wildlife (202)682-9400

David Hogan, Center for Biological Diversity (760)782-9244

Large coalition questions Colorado River dams and diversions:

Federal government asked to undertake comprehensive study of entire Colorado River watershed

SALT LAKE CITY -- Tonight at a public hearing to discuss the fate of 500-foot-high Flaming Gorge Dam located on the Green River in northeastern Utah, a coalition of 50 organizations will demand that the Bureau of Reclamation (the Bureau) vastly expand its piecemeal approach to environmental review for habitat restoration, and undertake a comprehensive study of all its activities in the Colorado River watershed.

The Bureau has been compelled to prepare an Environmental Impact Statement (EIS) on operations of Flaming Gorge Dam as a result of findings by the US Fish & Wildlife Service that the dam causes harm to endangered native fish species. The coalition will point out that since Flaming Gorge Dam is a component of a massive system that has impacted endangered species all the way to the Gulf of California, neither Flaming Gorge, nor the other dams in the system, can be looked at in isolation.

"The fish are becoming extinct because the Bureau has chopped the Colorado's habitat into tiny pieces," says John Weisheit, President of the Colorado River advocacy group Glen Canyon Action Network (GCAN) which will represent the coalition at tonight's meeting. "The only way to ensure their recovery is to put some of these pieces back together so the natural processes and habitats are restored."

"The endangered Humpback chub, Bonytail, Razorback sucker, and Colorado pikeminnow below Flaming Gorge Dam once populated the Green and Colorado Rivers from the top of the Colorado Plateau all the way to the estuary of the Colorado River Delta," adds Kara Gillon, an attorney with Defenders of Wildlife in Washington, DC. "We need the Bureau to show some leadership to bring this habitat back."

The coalition is also demanding that the Bureau evaluate the possibility of decommissioning Flaming Gorge Dam. Flaming Gorge Reservoir does not directly serve any major populations; its storage capacity is used primarily to regulate flows for other reservoirs downstream. Its 150 megawatts (MW) of hydroelectric power generation capacity are relatively insignificant when compared to the 500 MW recently eliminated by the Bureau from Glen Canyon Dam's operations in an effort to address endangered species problems in the Grand Canyon.

Although tonight's meeting is billed as a "scoping" meeting for the Bureau to obtain public input on issues that should be addressed in its study, the Bureau has recently stated that it refuses to evaluate decommissioning Flaming Gorge Dam.

"The Bureau is violating the spirit of the scoping process and the intent of the National Environmental Policy Act," says Brian Dunkiel, staff attorney with Friends of the Earth in Burlington, Vermont. "Dam decommissioning is being supported by the Army Corps of Engineers, the Federal Energy Regulatory Commission, and a number of state agencies as a means to recover endangered species. The Bureau has a legal obligation to consider this as a reasonable and scientifically defensible alternative for endangered fish recovery on the Green River and throughout the Colorado River basin."

Nor can the Bureau ignore calls for a comprehensive study. The agency is currently engaged in just such a process on the Rio Grande River in New Mexico. Moreover, while the Bureau is involved in 16 distinct projects and programs that address endangered species recovery in the Colorado River Basin, there is as yet no mechanism to demonstrate how these projects will work in cooperation or competition with one another.

"These efforts are all happening as if they are on different planets, yet they all affect species in the same watershed," says David Hogan, Desert Rivers Coordinator for the Center for Biological Diversity in Tucson, Arizona. "The Bureau must stop spinning its wheels with plans and studies that individually will not solve the problem, and get on with the task of implementing an effective basinwide species recovery plan." Such an approach was recommended in the 1997 report of the Western Water Policy Review Advisory Commission, established by Congress in 1992.

"A basinwide review will also help to further demonstrate that under federal law, Indian water rights are senior to all other uses, and must be addressed first, not last as the Bureau and other agencies seem to have forgotten," says Thomas Morris of Window Rock, Arizona, President of the Dineh Medicine Men's Association. "With these rights we will work to ensure the preservation and restoration of the river and Mother Earth, not continue to engineer its destruction as the Bureau of Reclamation has."

Other issues the coalition is calling on the Bureau to address include:

* The need to eliminate non-native predatory fish species that have been introduced into the watershed; * The need to eliminate water quality impacts associated with motorboat and personal watercraft use on Flaming Gorge Reservoir; and * The need to eliminate impacts of Flaming Gorge Dam's operation on park resources in Dinosaur National Monument, and ensure compliance with the National Park Service Organic Act.

Copies of the coalition's submission will be made available at tonight's hearing. A copy will also be posted on GCAN's web site (www.drainit.org) after 7:00pm MDT today.

The fight to pull Lake Powell's plug

by Judd Slivka for Arizona Republic

There are people, many people, who love it. Who think the greatest thing that ever happened to way-north Coconino County was the creation of Lake Powell, average depth 568 feet.

And there are those who hate what the lake stands for, hate that it was formed when the federal government in 1963 stopped up the Colorado River with a giant concrete plug called Glen Canyon Dam. Those people want to see the lake drained, the dam breached and the Colorado restored to its former magnificence.

It has been a bitter fight over an improbable objective: How do you drain a body of water more than 180 miles long that supplies power, water and jobs to a region without much of any of those without creating a battle?

You don't.

Lately, the abstract, rather odd dispute over Glen Canyon Dam and Lake Powell behind it has gotten more serious because it involves two of the most important dams in the Colorado River Storage Project. Which means lots of water, lots of jobs, lots of money. In other words, the battle over the West's dams is beginning. And it looks to last a long time.

Members of the 50 groups that want to drain the lake, accompanied by a virtual Who's Who of the Western environmental movement, including the Sierra Club and the Glen Canyon Action Network, argued earlier this week at a Bureau of Reclamation hearing in Salt Lake City to also drain Flaming Gorge Reservoir, which was created by damming the Green River in Utah.

Their side has opened an ice cream store in Utah to raise funds. The pro-lake people, buoyed by donations from corporate backers such as SRP are waging an ad campaign with striking Valley billboards and other road signs and the solicitation of donations.

There have been vandalism, harsh words and allegations of illegal behavior, of signs being illegally put up and illegally pulled down, of local law enforcement being complicit. The environmental groups' concerns center on the river's changing ecosystem.

There are four endangered fish in the Upper Colorado River Basin that the dams have affected. The water below Glen Canyon is often too cold to support even trout, and flows from the dam have scoured away much of the Grand Canyon's natural streamside habitat.

But to the burghers of Page and other communities on the lake, this is a fight against out-of-town environmentalists, carpetbaggers who don't make their livings off everything the lake has brought to the otherwise-arid high desert.

"The whole idea of Page is it's here because of the lake," said Alice Robinson of the Page Chamber of Commerce, which shares a phone number with the group trying to keep the lake, Friends of Lake Powell. "If the lake should be drained, that would be the end for Page. "If you're going to try and turn it back to what it was before, well, all the habitat that was there is gone."

Which, in reverse, is exactly the lake-drainers' point. "This is a small battle in the bigger picture of trying to restore the Colorado River watershed," said Owen Lammers, director of the Glen Canyon Action Network, the loudest of the groups trying to drain the lake. "It's not about what is more beautiful but about the health of the river," he said. "It's not just about the survival of endangered species. It's about the survival of humans."

The Valley billboards feature pictorials of the lake's dark blue waters and the clear blue skies above them, the walls of what used to be Glen Canyon rising dramatically over it. "Don't let the Sierra Club drain Lake Powell." Then comes a toll-free number for people to voice their support. Some people obviously don't.

At least two billboards have been vandalized. The billboard on North 16th Street lasted about four days before "Free H2O" was spray-painted in cobalt across it, the same paint blotting out the "Don't let the Sierra Club" portion of the message, leaving just "drain Lake Powell." Another sign, on 19th Avenue, lasted about as long and got the same treatment. Both are clean now.

Another theater of guerrilla warfare: An e-mail has been circulating about the signs, a missive that originated from the Moab, Utah-based Glen Canyon Action Network. "Several billboards along major freeways have been rented in Phoenix," the e-mail reads. "Feel free to call the toll-free number 888.845.POWE(LL) posted on the billboards to let them know how quickly you want the reservoir drained. Call as often as you like - it's free!"

In March, both sides held rallies on the same day on opposite sides of the lake, which brought out more police officers than had been at the lake at one time since the threat of terrorism in conjunction with the Oklahoma City bombing in 1995. "It wasn't until they came up to the dam to sing and dance about it that the companies (in Page) started taking them seriously," said Phoenix-area political consultant Jim Roush, a longtime lake lover who helped mount the ad campaign. "That's when we started getting corporate donations."

Donations are a bit tougher to come by for the lake-drainers. They've opened up an ice cream store in Moab, the Restoration Creamery, which contributes 66 cents for every \$1 sold toward restoration efforts. It earns money selling ice cream flavors with names that allude to Glen Canyon: Music Temple Almond Fudge, Fern Canyon Mint Chocolate Chip and Abbey's Rocky Road. The most popular flavor? Brower's Bear Claw, named for a former Sierra Club director who didn't fight to save Glen Canyon.

David Brower later called it the biggest mistake of his life.

BLM takes requests to drain Flaming Gorge reservoir

By RACHEL SAUER for Grand Junction Sentinel

Note: The Paper's reference to BLM is inaccurate. It should be the Bureau of Reclamation.

Calls to decommission the Flaming Gorge Dam and drain the reservoir or to leave things how they are will become part of the U.S. Bureau of Reclamation's environmental impact statement currently being prepared on the operation of Flaming Gorge Dam.

At a public scoping meeting Thursday night, one of five being held in the next week by the U.S. Bureau of Land Management, a representative of the Glen Canyon Action Network asked the Bureau of Land Management representatives present to consider decommissioning the dam as an alternative for Flaming Gorge.

David Orr, director of field programs for the network, said the groups represented in the network have concerns about whether the environmental impact statement is unnecessarily constrained and avoids the purpose of the National Environmental Policy Act.

"We want to initiate a (Colorado) Basin-wide study if we're going to recover species of endangered fish," he said. "What we see is the government trying to piecemeal this together."

The purpose of the environmental impact statement is to determine the effects of current and future operations of the dam on the downstream environment, particularly the existing populations and designated critical habitat of four Colorado River endangered fish: the razorback sucker, Colorado pikeminnow, humpback chub and bonytail found in the Green and Colorado river basins.

According to the BLM, the environmental impact statement will describe the effects of operating Flaming Gorge Dam to achieve the flows recommended by the Recovery Implementation Program for Endangered Fish Species in the Upper Colorado River Basin of the Endangered Species Act. Part of the data-gathering process is seeking public input on the fate of Flaming Gorge.

"I think it's important that we recognize the wisdom of nature," said Tonya Domurath of Grand Junction. "It's arrogant to believe we know more than the Creator when he put the river there."

Henry Rider, a 30-year Grand Junction resident, said during the meeting that he opposes proposals to decommission the dam.

"I think it's wrong," he said. "People need to go up there to enjoy life, they need to have that reservoir."

Orr said the Glen Canyon Action Network is concerned that the BLM has already decided not to address full recovery of the endangered species and is limiting access to documents and data on the recovery process.

The next public scoping meeting for the environmental impact statement will be from 6 to 9 p.m. Tuesday at the Western Park Convention Center in Vernal, Utah.

07/18/00

Babbitt won't drain lake on his watch

BY TODD GLASENAPP for Arizona Daily Sun

Don't expect Interior Secretary Bruce Babbitt to take his sledgehammer to Glen Canyon Dam in his last six months in office.

Despite hinting two years ago that he might support draining Lake Powell to restore natural flow in the Colorado River through the Grand Canyon, Babbitt told the mayors of three nearby communities last weekend that he's opposed to draining the lake, a 186-mile-long reservoir backed by the dam, an Interior spokesman confirmed Monday.

More than a dozen dams have been decommissioned since Babbitt took over leadership of Interior in January 1993.

He has likened their removal to taking a sledgehammer to them in the name of restoring river systems. The U.S. has about 75,000 dams in all.

Babbitt, in the area for a Saturday hike of a proposed national monument at Paria Plateau west of Page, opened a Friday meeting with some reassurance for the mayors of Page, Fredonia and Kanab, Utah.

"He said, 'I just want to let you know that it's not going to happen,'" said Mayor Karen Alvey of Kanab, a small town about 70 miles west of the lake.

To that, Page Mayor Bob Bowling said, "It's worth coming to this meeting just to hear that," Alvey said. Bowling is out of town this week and was unavailable for comment.

Interior spokesman John Wright confirmed that Babbitt is opposed to draining Powell. Wright said Babbitt wouldn't elaborate further.

Before Friday, Babbitt hadn't publicly stated a clear opinion on a proposal to drain the nation's second-largest artificial lake. Two environmental groups want Congress to decommission the 37-year-old dam near Page in order to restore Glen Canyon.

Babbitt has lamented ecosystem changes in the Grand Canyon that were brought about by the dam. In an October 1999 magazine article, the Flagstaff High graduate wrote, "In the depths of the Grand Canyon the waters rose and fell on a daily cycle, in response to the heating and air conditioning demands in Phoenix and Los Angeles."

Yet he is falling short of an early goal to take out a big dam during his tenure, says David Orr, of lake-drain advocate Glen Canyon Action Network based in Moab, Utah.

It's possible Babbitt is being careful to avoid offending Arizona's politicians and developers, Orr said, adding, "After he's finished at Interior, he'll be looking for something to do.

"We think the Interior Department is of two minds on this issue," Orr said Monday. "There is evidence that many people think decommissioning the dam makes a lot of sense. Obviously, Secretary Babbitt will be in office less than a year. He's punting, obviously, to the next administration."

Lake defenders had a much different take.

"Secretary Babbitt's comments are welcomed and perhaps will restore some sanity to this environmental agenda," said Paul Ostapuk, a spokesman for Page-based Friends of Lake Powell.

Kanab Mayor Alvey said too much is at stake to lose the lake and dam. At risk are the water, power, recreation and economic needs of millions.

Page officials have estimated the lake provides for 2,355 jobs for the city's three largest employers, with an annual payroll of \$42 million.

Momentum for draining the lake picked up four years ago with a vote by the Sierra Club's Board of Trustees. The Flagstaff-based Glen Canyon Institute organized in 1996, and Glen Canyon Action Network followed suit six months ago.

Glen Canyon Institute executive director Brian T. Gibbons declined comment Monday. Gibbons said he'd need to know more about the context of Babbitt's remarks before commenting.

Ostapuk was critical of the drain-the-lake advocates and accused them of "ice cream environmentalism." Glen Canyon Action Network sells ice cream from its "Restoration Creamery" in Moab.

"The Glen Canyon Action Network/Glen Canyon Institute notion to drain Lake Powell is not mainstream and has actually alienated many thinking individuals," Ostapuk said. "This is the chance you take when you engage in 'ice cream environmentalism.'"

In an August 1998 speech to the Ecological Society of America, Babbitt hinted at the possibility of draining Powell in the distant future.

"I think back to my beloved Colorado River, which I hiked and rafted and saw change before my very eyes," he said. "Once one of the mightiest rivers in America, it no longer makes it to the sea. That is a shame.

"As our generation passes, the toughest decisions rest firmly in your hands," closed Babbitt, then 60.

He also told the group that he preferred that dams be removed by community consensus.

"The truth is I have not brought my sledgehammer to a single dam that was not approved for removal by consensus of the inhabitants of the watershed," he said.

He said big-dam removal is tricky because it involves complex issues like water storage and electrical generation. That's why he said he liked the idea of controlled flooding to help restore ecosystems. Glen Canyon received a controlled flood four years ago.

07/25/00

Flaming Gorge Dam Debate Threatens More Than Fish

BY BRETT PRETTYMAN for Salt Lake Tribune

Catch and release angling has turned Utah's Green River below Flaming Gorge Reservoir into a world renowned fly-fishing destination. If some groups get their way, anglers will have to put back the biggest catch of all: 29 miles of blue-ribbon tailwater trout fishing and a 90-mile reservoir with its trophy-sized lake trout.

But like all the fish they have pulled from the Green and the Gorge, many anglers are willing to give up the fisheries if it means endangered species will be saved. They do question if that would be the case.

The U.S. Bureau of Reclamation recently held public meetings and now will analyze the response as it prepares an Environmental Impact Statement (EIS) on the operation of Flaming Gorge Dam in northeastern Utah. Although the EIS does not list decommissioning the dam as an alternative, several groups -- led by the Glen Canyon Action Network -- argue that removing the dam may be the best way to save the four endangered fish species on the Green below Flaming Gorge. The group threatens litigation if the Bureau doesn't explore the possibility of decommissioning the dam.

"I fully support the preservation of a species," said Steve Schmidt, owner of the Western Rivers Flyfishers shop in Salt Lake City. "If they can prove beyond a doubt that they can save a species by taking down a dam, then I am behind it."

The angling community is concerned about the possibility of losing two premier fisheries, but feels any change would take a long time for it to happen, if ever.

"They haven't done enough studies," said Paul Dremann, vice president of conservation for the Utah council of Trout Unlimited. "We are a long way from decommissioning or even beginning to support it. They need a study of the entire watershed of the Upper Colorado River system, not just Flaming Gorge Dam. There is no basis for decommissioning right now, except the ideology by a certain group of people that all dams should be removed."

Trout Unlimited was one of the main forces behind the successful effort to eliminate Edwards Dam on the Kennebec River in Maine last summer. Owen Lammers, a spokesperson for the Glen Canyon Action Network, agrees with Dremann about the need for a comprehensive study of the entire watershed, but says Flaming Gorge Dam is no longer needed for the purposes it was built for -- water storage and producing electricity -- and that all dams will come down eventually.

"The Endangered Species Act requires recovery," Lammers said. "They have not demonstrated the species can be recovered with the dam still there. The Bureau has to consider all the alternatives. This is not unprecedented to ask for." The Network is also asking the Bureau to review the need to eliminate non-native predatory fish in the watershed. If the dam is drained, the non-native fish could disappear because the dam helps maintain the colder temperatures needed for trout species.

After a five-year study on the razorback sucker, Colorado pikeminnow, humpback chub and bonytail, the Bureau is recommending river flows that will assist in the recovery of the endangered fish be controlled by the dam. There are five proposed scenarios for flows, set up to match the natural water cycle of the river. Although concerned the experimental flows tested on the river might hamper fishing, anglers now say it helped trout populations.

"As I understand it, the flows will not be any jeopardy to the trout," said Steve Brayton, the Division of Wildlife's project leader over Flaming Gorge and the Green River below the dam. "There isn't much of a difference from what we have already faced."

Brayton said the development of the EIS has "opened up the dialogue" between all the organizations concerned with flows from the dam and said the angler's voice is being heard more now than ever.

"People have the right to speak their mind; to let the Bureau know what resources they are interested in protecting," Brayton said. "Some people feel the best thing for the endangered species is to remove the dam. They are certainly entitled to voice that opinion."

No one wants to say one species of fish is more valuable than another, but there are some numbers and facts the Bureau has pointed out in literature available at the public meetings:

- The Flaming Gorge National Recreation Area is the flagship of the national recreation areas in the U.S. Forest Service. It was the first national recreation area in the agency.

- The Flaming Gorge National Recreation Area attracts between 700,000 and 2 million visitors annually.

- Direct and indirect annual expenditures connected with river experiences and uses are estimated at \$25 million. The total is close to \$100 million for the entire national recreation area.

-- The 13 outfitter/guide businesses which use the Green River below the dam to the Colorado stateline report an annual revenue of more than \$1.3 million.

Those interested can send written comments to Kerry Schwartz, Bureau of Reclamation, Provo Area Office, 302 E. 1860 South, Provo, Utah 84606-7317. Comments can also be sent via e-mail to Kschwartz@uc.usbr.gov. Written comments must be received no later than Sept. 5.

"We have had some good comments and not one of them is more important than the other," Schwartz said. "We will analyze them all and determine whether they are pertinent to the EIS process."

Schwartz said once all the comments have been received by the Sept. 5 deadline, new issues will be identified and placed in a draft EIS. The draft will include alternatives and should be ready by July of next year.

Once the draft document is published, there will be another public hearing process. Comments from those meetings will be reviewed and a final EIS should be released in December, 2001.

07/27/00

Ralph Nader Denounces Administration's Extinction Plan For Rivers

CONTACT: Owen Lammers, 435-259-1063

MOAB, Utah -- Today environmental leaders, led by former Sierra Club Executive Director David Brower, joined Green Party Presidential candidate Ralph Nader in blasting Vice-President Al Gore and the Clinton Administration for their failure to forestall the extinction of endangered fish species in the Columbia River and Colorado River watersheds.

Despite overwhelming scientific agreement that breaching of four fish-killing dams on the Snake River in eastern Washington state is necessary to protect dying salmon species, Mr. Gore is on record supporting the Clinton Administration's recent decision to abandon the breaching proposal.

"Al Gore has shown that enforcing the Endangered Species Act and the National Environmental Policy Act is unimportant in a tight political race," said Mr. Nader. "Despite his reputation as being stiff, the Vice-President seems to have little backbone when it comes to protecting the environment."

Trout Unlimited recently called the Administration's position a "death sentence" for Snake River salmon.

Noted environmental leader David Brower echoed Mr. Nader's sentiments. "The Vice-President is ignoring the law; is extinction necessary to get Mr. Gore's attention?"

In the Southwest earlier this month, calls for decommissioning fish-killing dams were dismissed by the Administration. Federal dams in the Colorado River watershed are largely responsible for the endangerment of four fish species native to the river system vital to our prized national parks, including Grand Canyon.

A coalition of fifty-five organizations led by Glen Canyon Action Network (GCAN) of Moab, Utah, called for decommissioning studies to be done on Flaming Gorge Dam on the Green River and a comprehensive study of endangered fish recovery to be performed for the entire Colorado River basin. In clear violation of Council on Environmental Quality guidelines under the National Environmental Policy Act, the Administration announced it would not conduct a decommissioning study for Flaming Gorge. CEQ and NEPA regulations specify that the Administration must examine a range of alternatives in the NEPA process, not concentrate solely on a predetermined course of action which does not guarantee recovery--a requirement of the Endangered Species Act.

Recently the Administration declared its opposition to decommissioning Glen Canyon Dam on the Colorado River, failing once again to support recovery of endangered species and restoration of the river ecosystem through Grand Canyon National Park. Over the past four months, a GCAN-led coalition of sixty-five organizations has called for removing Glen Canyon Dam and restoring 250 miles of inundated river.

"Al Gore fiddles while the Earth burns," said Mr. Brower, Chairman of Earth Island Institute. "Scientists agree that many dams have to go if we're to save our rivers, but the Vice-President seems willing to sacrifice it all for commercial interests."

Many rivers in the United States are profoundly harmed by dams which block fish migration routes and destroy habitat. For years, dam removal has been known to be critical in protecting and restoring endangered fish populations.

"The Columbia and Colorado river systems are dying, and their resuscitation depends on dam decommissioning," said GCAN President John Weisheit. "Alternatives are available to address all the supposed benefits of these dams, but Clinton and Gore would rather watch these rivers perish than have the Vice President lose campaign contributions."

The Administration continues to discount the viability of and growing need for removing large dams as part of a sound river management policy for the twenty-first century.

* Power generated by dams is becoming less economical as the cost of environmental mitigation increases. Increasing energy conservation efforts using existing technologies can lead to significant reductions in electricity demand.

* The vast majority of water diverted from rivers is used for heavily subsidized and inefficient irrigated agriculture. More appropriate agricultural practices could eliminate the need for many of these dams and still meet municipal needs for generations to come.

* Existing road and rail transportation systems provide viable alternatives to dam-assisted river transportation and allow the costs of moving commodities to be incurred by shippers instead of being subsidized by taxpayers.

* Despite massive investments in structural approaches to flood control, rising economic flood losses have caused river management experts to plan for and work with floods instead of trying to defend against them.

Mr. Brower and Mr. Nader noted that Vice-President Gore "has set a new standard for hollow environmental rhetoric" and urged the Vice-President to act on his book, "Earth in the Balance," to safeguard biological diversity.

"Had Mr. Gore read his book as carefully as I have," said Mr. Brower, "he would realize the necessity of decommissioning the dam that could restore Glen Canyon, a world wonder equal to the Grand Canyon."

CREDA's credibility called into question

Glen Canyon Action Network

FOR IMMEDIATE RELEASE CONTACT: DAVID ORR (435) 259-1063

Power association misleads, inflames public opinion, environmental leaders say

MOAB, Utah -- Colorado River restoration advocates today blasted the Colorado River Energy Distributors Association (CREDA) for misleading its member electric utility companies and the communities throughout its service area about the effects of decommissioning dams in the Colorado River watershed.

According to recent reports in the Farmington, New Mexico, Daily Times, CREDA has asked the Farmington City Council to approve a resolution opposing draining Lake Powell and other unneeded reservoirs on the grounds that purchasers of hydroelectric power generated by these dams might pay higher prices for electricity.

"By oversimplifying the problem, CREDA is misleading its member companies and attempting to inflame public opinion," stated David Orr, Field Director of Glen Canyon Action Network (GCAN). "In this rapidly deregulating energy market, it is dishonest to make such predictions."

CREDA is a trade association representing buyers of hydropower from dams on the Colorado River and its tributaries. CREDA's member companies have for years enjoyed heavily subsidized electric power financed by federal taxpayers. Environmental costs have been largely ignored over the lifetime of these projects.

"Dinosaur utilities like CREDA may just go extinct unless they respond to changing conditions in energy markets," said Mr. Orr. "These executives need to understand that

it's no longer necessary for them to destroy rivers and pollute the air to generate electricity for their customers."

Dams in the Colorado River watershed drowned major river segments and caused significant harm to the river and to native fish and wildlife. Glen Canyon Dam in particular has caused enormous damage to Grand Canyon National Park. Passage of the Grand Canyon Protection Act in 1992 was a first step in mitigating the destructive effects of Glen Canyon Dam. Costs of the first phase alone were more than \$60 million. These costs, which have recently fallen on ratepayers, continue to mount. Glen Canyon Dam hydropower costs will continue rising in order to pay growing environmental mitigation bills.

Colorado River dams are known to cause thermal and chemical pollution of water and destroy critical habitat for fish and wildlife. Four species of native fish are endangered in part because of Glen Canyon Dam and other dams in the Colorado River watershed.

In recent months, more than sixty environmental and community groups have joined with GCAN in calling for decommissioning Colorado River dams--pointing to Glen Canyon in particular--as an integral and necessary element of a successful river restoration solution.

Dirty power not only kills rivers but pollutes our air, too.

The Four Corners Power Plant in nearby Shiprock, New Mexico, is one of the dirtiest power plants in the region, according to a recent report by the Public Interest Research Group. Coal burning power plants will also be decommissioned in coming years as Clean Air Act regulations force older plants to shut down. Because of high environmental costs, no new coal fired plants are likely to be constructed.

While residents of northwest New Mexico choke on mercury and other toxic pollutants from Four Corners, and the Colorado River and Grand Canyon ecosystems are destroyed by dams, CREDA goes on the defensive.

"Utilities should be leading the charge for cleaner power, not running away," continued Mr. Orr. "The potential for cheap solar power development in this region is tremendous, yet the industry clinging foolishly to past technologies."

New technologies are leading to development of high-efficiency appliances and affordable solar and wind power generating sources. Engineers are racing to perfect inexpensive fuel cells which promise to revolutionize the way that power is delivered to consumers.

Conservation is a critical component of a strategy to shift away from coal, nuclear, and hydropower, toward low-polluting renewable sources. As large dams are decommissioned, state of the art energy conservation practices, including demand management techniques, will reduce consumption of electricity while maintaining a high quality of life.

The dams on the Colorado River were built nearly forty years ago when utilities operated as monopolies and politicians promoted power development to stimulate economic growth and development of cities such as Phoenix and Las Vegas. The economy, culture, and environment have changed dramatically over the years.

"Even if the projected rate increases were to come to pass, they amount to about one to three dollars per month per household," said Mr. Orr. "Given the enormity of the ecological damage, shouldn't we be willing to pay this small price for restoring our rivers?"

"Rivers are the lifeblood of the Southwest," continued Mr. Orr. "Certainly the people of Farmington can make the distinction between dollars and sense."

#

[Glen Canyon Action Network is a people's movement dedicated to the integrity of the Colorado River Watershed. Through grass-roots organizing, research, education and lobbying of federal and state river management agencies, GCAN promotes alternative approaches to energy generation and water utilization to create opportunities to decommission structural interventions into the Colorado River system and to restore its natural processes.]

Living Rivers Phoenix Office opens

FOR IMMEDIATE RELEASE

November 22, 2000

CONTACT: Lisa Force 480.990.7839 email Owen Lammers 435.259.1063

GROUP SEEKING TO RESTORE COLORADO RIVER OPENS PHOENIX OFFICE

Targets Central Arizona Project with Conservation Strategies

PHOENIX, Arizona - The Glen Canyon Action Network (GCAN), the environmental group working to restore Glen Canyon, today announced formation of an umbrella organization called Living Rivers, with the aim of promoting river restoration in the western United States. Lisa Force, an accomplished and successful advocate for river restoration in Arizona, will lead Living Rivers' new southwest regional office, opening today in Phoenix. Formerly a program director with the Center for Biological Diversity, Ms. Force was lead negotiator responsible for convincing Arizona Public Service Company to decommission its Childs and Irving hydroelectric power plants, including the removal of its dams. She was recently spokesperson for the successful "No on Proposition 102" campaign.

"The Colorado River desperately needs advocates now," says Ms. Force. "The riverine ecosystem of our magnificent Grand Canyon and the once biologically rich Colorado River Delta are dying, yet Arizonans are being asked to give more of their river every day." Tremendous environmental destruction is wrought by the Central Arizona Project (CAP). In 1993, Arizona politicians completed the CAP, a canal from the Colorado River capable of diverting nearly 20% of the Colorado's annual flow.

"We never needed the CAP, and we don't need it now," says Owen Lammers of Glen Canyon Action Network and the Executive Director of Living Rivers. "We can implement water conservation strategies that will assure sustainable water supplies for years to come while allowing the river to flow again. Now the CAP is promoting more development and water abuse to pay off its \$4 billion construction costs. It's time to put a lid on CAP."

The CAP legislation requires mitigation for the environmental destruction it causes. "Mitigation has never been implemented," says Ms. Force. "Living Rivers will be asking CAP to comply with the law. One way CAP could achieve partial mitigation would be to restore Glen Canyon and the Delta."

Other environmental groups praised the founding of the new organization. Sierra Club Director Michael Dorsey of Ann Arbor, Michigan, states, "Living Rivers is the new style of river advocacy that is desperately needed for the 21st century."

Living Rivers' mission is to give voice to the growing popular support for large-scale river restoration. The initial focus is the Colorado River, with efforts also building on the Rio Grande River watershed to the east. "Through education and conservation we can eliminate the need for straws from the Colorado, and impoundments like Glen Canyon Dam," says Owen Lammers, the Executive Director of Living Rivers. "We can meet our water needs and revive the river at the same time; it's a win-win."

Living Rivers' message will soon be arriving in the metropolitan areas in the seven-state Colorado River Basin that includes Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming.

To National Park Service to Proposed Stop Lake Powell Marina

Mr. Kelsey Begaye
President Navajo Nation
Office of the President Window Rock, AZ 86515

Re: Antelope Point Marina project

Dear Mr. President,

I am writing out of concern for the effects on the Navajo Nation from the development of the proposed Antelope Point Marina project on the Lake Powell reservoir. The Diné Medicine Men's Association Incorporated (DMAI), represents the interests of traditional Diné people and the protection, preservation, perpetuation and restoration of cultural properties important to us. We are concerned about sacred and ceremonial sites and the health of our people. Solicitations for developing the Antelope Point project were recently sent to five prospective developers, yet we believe that there are serious issues which must be addressed by our nation before any further actions are taken pertaining to this project.

We applaud your efforts to pursue economic development opportunities for the Navajo people, and for attempting to secure some of the tourism revenues resulting from the bilįganį's use of what was once Navajo land at Lake Powell reservoir (Glen Canyon National Recreation Area, or GCNRA). We appreciate the efforts to make this project as beneficial as possible to our people's financial and political interests. The preferential hiring recommendations, the arts & cultural center, educational objectives, political position as well as income from the ground lease and percentage of gross revenues are important.

However, given the large size of the project and other concerns, we do not see this as sustainable economic development for our people. We believe the Nation's economic development strategy should emphasize taking over the existing concessions operations at Lake Powell reservoir, particularly at Wahweap Marina, rather than promoting additional development that increases pollution and ill health among our people, and causes damage to cultural and historic properties. We further suggest the Antelope point development be designated to be related to and designed to be a quiet zone, a place for solitude and healing (a traditionally based healing place for all people to enjoy). Such a move would be far more economical and financially rewarding for the Nation and the environment and the health of people.

Antelope Point is a complex project that will require the commitment of a huge amount of the Nation's resources, which may not, in the end, prove to be a good business investment. Let the Wahweap portion be the bilįganį's version economic progress, it is already successful. The Antelope Point will be for healing. We have a tremendous opportunity to implement a strategy that is part of a longer-term vision for sustainability

for our people, to enable them to live in harmony with the land and reverence for our culture and traditional properties and way of life.

To this end, we request that you suspend action on the Antelope Point project until the Navajo people can be made fully aware of the impacts. Alternative strategies for the Nation to benefit financially from the recreation and tourist industry on Lake Powell reservoir must be considered. Specifically, we request that you support the efforts of our association in calling on the National Park Service (NPS) and the Bureau of Indian Affairs (BIA) to conduct a full Environmental Impact Statement (EIS) for the project. We also request that the Navajo Nation fully disclose the proposed sale of alcoholic beverages and the disturbance of ceremonial and archeological sites that will be required for this project. It is spiritually and sacredly out of balance to promote healing on one hand and sell liquor in the other.

Background

Before Glen Canyon Dam was built, the land that is now flooded by Lake Powell reservoir along the Colorado River and San Juan River belonged to the Navajo Nation. Our people had direct ownership and control of these rivers right to the centerline. Some of the most beautiful and sacred canyons on Earth, including many narrow side canyons, were also important places where our people farmed, raised sheep and cattle, and practiced traditional cultural ways and ceremonies. Diné and other indigenous people who lived in or near and used these canyons were relocated to make way for the bilįganį's reservoir. Some of our most important sacred sites--including Rainbow Bridge--were also flooded by the reservoir.

These concerns have been expressed over many years. In the 1970s, medicine people from Navajo Mountain Chapter and Shonto Chapter sued unsuccessfully in federal court to stop the filling of Lake Powell reservoir because it would desecrate Rainbow Bridge. I often wonder how defeated they felt while they lost the land. The experts agreed that the reservoir harms our right to practice our traditional ways of life, but the court refused to stop the flooding.

The City of Page, Arizona, stands today on former Navajo Nation land that was traded to the U.S. government in 1958 to build the Glen Canyon Dam work camp. The town became privatized in the 1970s and has come increasingly under control of non-Navajo corporate interests ever since. Imagine our young entrepreneurs capitalizing on this and with our own effort. Today, the ARAMARK Corporation controls virtually all tourist access to Rainbow Bridge through guided tours from Wahweap Marina and other marinas on the reservoir. Hundreds, sometimes thousands, of visitors in a single day come to visit this sacred shrine not for the same reasons we would go there but for pleasure. The Navajo Nation gets none of the profits from this tourist trade, merely a few jobs and because of the lack of privacy to practice our ceremonies, the practice now subject to the destruction of our ways. We lost much when Glen Canyon Dam was built. The Navajo Nation has a continuing interest in seeing that tourism at Lake Powell reservoir and Rainbow Bridge in particular is appropriate and respectful. We must use this opportunity to do the right thing. The elders say that water is sacred and must be

treated with respect and the firma is our mother and must also be treated with respect. These values we must perpetuate for our people.

As you know, the Diné Medicinemen's Association Incorporated supports the restoration of our sacred sites in Glen Canyon. While this will not happen right away, we believe we must deliberately move in that direction and this is a beginning. In the near term, however, we need sustainable economic development that enhances and protects and promotes our cultural traditions. The Navajo Nation can begin managing the concessions around Lake Powell (Specifically Wahweap area) reservoir, and promoting a more human-powered, environmentally benign and culturally aware and appropriate tourism industry at the Antelope Point. This would be a welcome replacement to that which exists today, where motor boaters use our sacred sites as a playground with no environmental or cultural awareness.

Our Concerns about Possible Violations of Navajo Nation Law

We are concerned that the impacts resulting from the Antelope Point project will have significant effects on the social life of our people if it follows the course designed currently. We worry that increasing tourist development that is not respectful of our heritage and our traditional ways will only further erode the Diné (The People's) knowledge of and respect for our culture. Additionally, if we were to compete with the ARAMARK Corporation just across the lake it would be our financial miscalculation and loss. A new marina on Lake Powell reservoir will emphasize motorized recreation--a pastime for the bilįganį.

Sacred Sites

Navajo Nation laws make it a crime to harm or destroy sacred sites and places of historic and cultural significance. We want our government to enforce that law. The Antelope Point project would be constructed in an area that has cultural sites needing protection under this law. Lake Powell reservoir itself violates tribal law because it covered over many significant sacred and cultural sites beneath the waters. Rather than continue to desecrate and destroy, we ask for respect, restoration, protection, preservation and perpetuation of our sacred sites and ways. Our traditional and unwritten laws of the holy beings have prescribed this to be so.

Alcoholic Beverages

According to the U.S. government's 1986 document, "Antelope Point Final Development Concept Plan Environmental Assessment," the project's feasibility depends upon legalizing the sale of alcoholic beverages (page 7). This would require legalizing the transport and consumption of alcoholic beverages on Navajo land. This would have significant social impacts on the Navajo Nation where, as you know, alcohol is currently banned. An exemption to our law would be required, and we worry that the Navajo people have not been fully informed nor have they given their consent for these changes to be made. We would like an open debate on this question before any further commitments are made on the project. Alcohol has been our destruction as we all know and have seen all around us.

Many recreational users of Lake Powell reservoir have a reputation for heavy drinking and other inappropriate and disrespectful illicit activity. Earlier this year, the Associated Press listed the reservoir as the nation's second most dangerous recreation area for injuries and deaths. Most of these incidents involved alcohol. This kind of behavior may become common at Antelope Point. Do we want our children to grow up witnessing it on the reservation?

The marina operator would have to transport significant quantities of liquor onto the reservation just to supply the marina. But many private vehicle and boat owners will bring alcohol to the marina across reservation lands. We need to know how this will be policed, and how the nation will deal with expected increases in law enforcement incidents such as drunk driving and motor vehicle accidents on the narrow road that leads to the marina. An increase in alcohol-related injuries and possibly deaths may occur not only on land but also on the water, especially on heavy use weekends. Is this the price that must be paid for a few jobs?

The social impact of the Antelope Point Marina project would be great, yet it has not been adequately considered. Before any additional work is done on the project, we must obtain and evaluate this important information in detail, and allow for an opportunity to discuss and debate the issues across the Navajo Nation.

Environmental Degradation and Violations of Federal Law

In 1986, the U.S. government produced the "Antelope Point Development Concept Plan Environmental Assessment" (DCPEA), along with a Finding of No Significant Impact (FONSI). This document, the DCPEA/FONSI--is now fourteen years old, yet many changes have occurred in and around Lake Powell reservoir. We believe the document was legally insufficient at the time it was produced, and it is insufficient today.

The National Environmental Policy Act (NEPA) requires full study and evaluation of any project that involves the U.S. government that has a significant impact on the human environment. The impacts of Antelope Point have not been fully studied or revealed, therefore the law requires that a new study be done that supersedes the 1986 DCPEA. And since the impacts are significant, it will require that an EIS be done.

The marina would permit a significant increase in the number of boats and personal watercraft (PWC) on the reservoir during heavy recreational use periods. The exhaust emitted by these craft contributes to air and water pollution. PWCs in particular are known to spew oil and gasoline into the water, polluting not only the reservoir that is the drinking water supply for millions of people downstream, but also harming our sacred sites. This concern was not evaluated in the 1986 DCPEA, and the NPS has not studied or even monitored this pollution to date.

There is also a human waste problem. The NPS has had to close many beach areas on Lake Powell reservoir in the last decade because of human waste contamination. The filth comes from houseboaters and other recreational users. We do not want sacred waters to become cesspools. The Antelope Point will probably add to this problem by putting more boaters on the reservoir.

Another point of concern for us is the proposed marina's location near the Navajo Generating Station (NGS), a coal-burning electric power plant. The 1986 DCPEA does not consider the health effects on our people of living and working near this plant, which is shown by U.S. government records to be one of the largest air pollution sources in the country. Pollutants from the stacks fall back to Earth on our reservation, where our children breathe them in. Asthma and other respiratory diseases are already a big problem. How badly will the workers at the marina be exposed to the poisons in the air, and how many will become ill from it? These questions have to be addressed. We must move here with cultural information and with the purpose of affecting the policy of the polluting neighbor.

We request that you ensure our people have access to such analysis, and join us in calling on the National Park Service and Bureau of Indian Affairs to conduct a full Environmental Impact Statement on the Antelope Point project.

Sustainable Economic Development

The Antelope Point Marina project requires the existence of an artificial reservoir, the extensive use of polluting non-essential vehicles, at a location downwind of one of the most polluting power plants in the country. For this our people will receive a few jobs, some rental payments, increased illness, alcoholism and further degradation of our sacred lands. This is not sustainable economic development, and we regret the Navajo Nation's use of this term in the prospectus released October 27. If this were the last or only possibility to support our people, maybe it could be justifiable. But it's not. It merely reflects an ongoing pattern of the Navajo people accepting a few scraps to service development for wealthy white people, while the real problems affecting our own people become more entrenched. Currently the Navajo Nation receives hardly any revenue from the tourism trade. At Rainbow Bridge, for example, a big corporation, ARAMARK receives profits from hundreds, and sometimes thousands of tourists every day on boats owned by ARAMARK. ARAMARK is one of the companies that want to build and operate the Antelope Point Marina project. The Diné Medicine Men's Association Incorporated does not promote tourism to sacred sites, but we feel that so long as Lake Powell reservoir remains in place, Diné should be in control of managing the boatloads of tourists and other economic concerns and of those who visit Rainbow Bridge, the sacred waters and sites. This is a good opportunity to teach about our duty to protect the earth for which we have been recognized as a people.

The Lake Powell reservoir tourist business is very profitable to ARAMARK, but we must remember that much of the land that was flooded by Lake Powell reservoir was once our land, and the Colorado River and San Juan River our rivers. We have a responsibility to be good stewards of the rivers and the land, and work to protect and restore them. We cannot stand by and allow them to continue being harmed by pollution, or to be disrespected by those who are ignorant of our traditions and the sacred ways.

We have an opportunity to assert our culture and ourselves to demand that the NPS begin giving back to the Navajo people. We should be championing a Navajo-based

management plan for Glen Canyon, as opposed to one driven by the rich corporations. Glen Canyon is a sacred place, and should be treated as such. We the Navajo can do this, and we do not need additional development to succeed. Instead of receiving some small payments from something new, we should go back and take control of what's there now. The corporations are making money off what is our traditional land, especially Rainbow Bridge National Monument. There is no reason why the Navajo people should not take responsibility for this concession. In fact we should see it as our responsibility to our sacred gods to do so. The same may be said of Wahweap Marina, and other developments along the reservoir. We are the people who live and have cared for these lands. If profits are to be made, they should arise in a fashion consistent with our traditions, and stay in Navajo hands, not go to a corporation based in Philadelphia.

We can manage these concessions such that we are reducing the level of pollution, and increasing the level of cultural awareness, while generating far more income than what may come from the Antelope Point Marina project. We can do this without disposing of our ban of alcoholic beverages. And once Glen Canyon Dam is decommissioned, either because of sediment, an act of the gods, or the growing social demands that our sacred sites be uncovered, we will be ready to service all those new visitors wishing to experience with us nature's healing ways.

Implementing local control and a more sustainable economy for Glen Canyon can also be applied to our water and energy needs on the reservation. Our people get no power from the Navajo Generating Station, only pollution and some jobs. It may soon be required to close this down, as it is not in compliance with written environmental laws and of the unwritten sacred laws which govern us. The Navajo Nation could aggressively invest in solar and wind power to both service our people's needs and to sell to white people in Phoenix, Las Vegas and Los Angeles, many of whom are willing to pay very high prices for cleaner energy now. We could also use this energy to pump water from either our aquifer at Navajo Mountain or from the river. In summary, we should use our discussions surrounding the Antelope Point project as a turning point to help our economy become more in balance with nature and our traditional ways, not a further threat to both.

Conclusion

The Antelope Point Marina project must not be given further consideration until a much more detailed analysis of the impacts and the economic alternatives for the Navajo people have been completed. We expect that increased pollution from boats and PWCs will result from the project, as will social problems relating to the use and abuse of alcohol and dangerous drugs. Health problems resulting from exposure to air pollution from the nearby Navajo Generating Station will likely afflict Navajos and others employed at the marina. The analysis of these impacts in the 1986 NPS document does not meet the requirements under the National Environmental Policy Act. The Diné Medicine Men's Association respectfully requests that you inform the BIA, the NPS, and the prospective developers that the Navajo Nation will require a full EIS which examines in detail the social and environmental effects of the project, and an open debate of the

project's precedent-setting nature, before the government can agree to proceed with design and construction of the marina.

The Navajo Nation sometimes has a short memory when it comes to our land and our rivers. Why would we support construction of a big tourist development that will only pollute the land and water and air that we need for our survival, when we can work to reverse this and generate revenue for the nation at the same time. Is the Navajo Nation forgetting our Diné history? These canyons are the very places where a traditional Diné Leader, Hoskinninni, led his people to hide from the white man's army when Kit Carson's men took the rest of our nation's people away from the Dinétah on the Long Walk to the Bosque Redondo. We should be honoring these places which are sacred not only to our traditional ways of life but also to our people's more recent history. We should not be leading the effort to further desecrate them and commercialize them, nor should we be handing over the land to corporations. Our people deserve better.

Please do not hesitate to contact us if you have any questions.

Sincerely,

Thomas Morris, Jr. President

Native Americans question proposed new Lake Powell marina

Groups call for E.I.S. on project
CONTACT: David Orr, 435-259-1063

MOAB, Utah -- A coalition of eight Native American and environmental organizations today called on the National Park Service (NPS) to suspend contract and other work on development of the proposed Antelope Point Marina near Page, Arizona. In a letter to the NPS, the groups asked that an Environmental Impact Statement (EIS) be prepared before approving construction contracts for the project at Glen Canyon National Recreation Area (Lake Powell reservoir).

The Glen Canyon Action Network (GCAN) of Moab, Utah, and the Diné Medicine Men's Association of Window Rock, Arizona, are leading the effort, with support from environmental groups Diné CARE, Bluewater Network/Earth Island Institute, Colorado Plateau River Guides, Flagstaff Activist Network, Grand Canyon Private Boaters Association, Utah Environmental Congress, and Wild Wilderness.

The "Development Concept Plan & Environmental Assessment" for Antelope Point was completed in 1986, but did not acknowledge the project's significant impact on the environment. The inadequate and now-outdated plan does not satisfy legal requirements of the National Environmental Policy Act (NEPA).

"Federal law requires that all environmental impacts be evaluated in a timely manner, and a full range of alternatives be considered," said David Orr, Director of Field Programs for GCAN. "The National Park Service has not done its job."

According to published plans, up to 225 hotel rooms and 300 boat slips are to be constructed at Antelope Point, as are a gas station and fueling docks, 150-space RV campground, sewage plant, up to 100 units of commercial housing, food service, and other commercial operations. The NPS recently issued a prospectus to five developers seeking to build and operate the marina, which the NPS and the Navajo Nation would jointly oversee.

Native American leaders expressed concerns about the marina project.

In a separate letter to Navajo Nation President Kelsey Begaye, the Diné Medicine Men's Association questioned the tribe's plan to legalize the sale and consumption of alcoholic beverages at the proposed marina, despite the Navajo Nation's longstanding prohibition on alcohol.

According to the marina development plan, archeological and ceremonial sites would be harmed by construction and recreational activities.

"We are working to save our sacred sites and protect our cultural heritage," said Mr. Thomas Morris, Jr., of Window Rock, President of the Diné Medicine Men's Association. "The Navajo Nation should be supporting traditional ways and setting good examples for children, but here they want to sell liquor and promote jetskis."

The medicine men and other indigenous leaders also asked for consideration of economically viable alternatives to building a new marina. The groups are proposing that the NPS study, in the EIS, allowing the Navajo Nation to take over the concession contract for the existing Wahweap Marina, just five miles away from Antelope Point and located in a less environmentally sensitive area.

"Building more tourist resorts won't really help people build a sustainable economic future for themselves," said Ms. Anna Frazier, Executive Director of Diné CARE, a Diné (Navajo) environmental group. "We need to focus on providing basic necessities, like developing safe drinking water supplies and renewable energy sources for our rural communities, and educating our people on ways to conserve energy and water."

The groups also expressed concern about the water pollution that the Antelope Point Marina project would generate, especially from increased numbers of personal watercraft (PWCs) on Lake Powell reservoir. The inefficient two-cycle PWC engines emit large amounts of unburned oil and gasoline into waterbodies through their exhaust systems, potentially endangering drinking water quality for more than 20 million Colorado River water users downstream. Environmentalists are asking NPS to institute

a comprehensive water pollution monitoring program as part of the planning process for the new EIS.

The five corporations bidding to develop the Antelope Point project are: ARAMARK (current monopoly concessioner at Lake Powell reservoir), Delaware North (concessioner at Yosemite and Grand Canyon), Forever Resorts (concessioner at Lake Mead), KOA Kampgrounds, and Swift Trucking Company dba Antelope GMT.

Re: **Request for EIS on Proposed Antelope Point Marina Project**

Dear Acting Superintendent Collins:

Glen Canyon Action Network (GCAN) is an environmental advocacy group based in Moab, Utah, dedicated to protecting and restoring the integrity of the Colorado River watershed. We are joined in this letter by the following organizations: Din? CARE, Bluewater Network of Earth Island Institute, Colorado Plateau River Guides, Flagstaff Activist Network, Grand Canyon Private Boaters Association, Utah Environmental Congress, and Wild Wilderness. We write to you concerning the proposed development of the Antelope Point Marina at Lake Powell reservoir/Glen Canyon National Recreation Area (GCNRA).

We understand that a prospectus was published and mailed to prospective developers of the project on Friday, October 27, 2000, by the GCNRA Concessions Office. However, we are concerned that this project is moving forward without sufficient environmental review as required by the National Environmental Policy Act (NEPA). We believe that the National Park Service (NPS) did not comply with NEPA requirements in preparing its 1986 "Development Concept Plan and Environmental Assessment" (DCP/EA). Significant impacts existed at the time that should have been analyzed in a full Environmental Impact Statement (EIS), not in an EA.

Much has changed since 1986, and some additional significant impacts have come to light in the interim. We disagree with NPS's February 19, 1997, determination that the project does not require additional NEPA analysis. We believe the law requires that an EIS must be prepared before further steps are taken toward developing the project. We therefore respectfully request the following:

1. that the prospectus be withdrawn pending resolution of these concerns;

2. that you determine that the "Finding of No Significant Impact" (FONSI) issued in 1986 and the letter written by NPS staff Mr. Ken McMullen on 2/19/97 to then-Superintendent Joseph Alston are not legally valid and do not reflect compliance with NEPA; and
3. that you prepare an EIS before proceeding with any further work on the Antelope Point Marina project.

We also specifically request that you consider as an alternative in the EIS the option of reassigning the existing concessions contract at Wahweap Marina and the associated Rainbow Bridge tour concession to the Navajo Nation, in lieu of constructing new recreational infrastructure at Antelope Point.

Please provide us with a list of all planned and/or completed mitigation measures for this project, including especially any measures relevant to the archeological resource concerns discussed in Item 1 of the 1986 FONSI.

We respectfully request that you provide us with a response to this letter by December 11, 2000. If you disagree with our analysis and decline to grant our requests, we will request a review of the project by the Park Service Director in Washington, DC.

We are happy to discuss this matter with you in more detail if you wish. We have prepared an analysis of our concerns in this letter. We are confident that our conclusion constitutes an appropriate interpretation of the applicability of NEPA to the circumstances of this case, and we hope that you will agree. Please do not hesitate to contact GCAN should you have any questions. We look forward to hearing from you.

BACKGROUND

The Antelope Point Marina project covers lands and waters managed by NPS and by the Navajo Nation. The project is currently moving forward with joint approval by NPS, the Navajo Nation, and the Bureau of Indian Affairs. NPS has assumed the role of lead agency.

The DCP/EA and FONSI were published in 1986. More than a decade passed before the agencies involved showed serious interest in pursuing the project. In 1997 a decision was made to reactivate the long-dormant proposal. On February 19 of that year, GCNRA environmental specialist Ken McMullen sent a three-page letter to the GCNRA Superintendent, recommending that the 1986 DCP/EA be accepted as "accurate and applicable" to the old plan under NEPA. Apparently there was concern within the agency about the adequacy of the 1986 DCP/EA. This letter sought to resolve those concerns by making the following points:

1. The current proposed action is essentially the same as the old plan;
2. a reasonable range of alternatives has already been analyzed;
3. the same information and circumstances exist today as in 1986;
4. the impacts discussed in the 1986 document are not significantly changed;

5. public involvement and participation in 1986 were appropriately covered and are still relevant; and
6. no additional consultation is required, except possible cultural resource consultation with the Navajo Nation.

Following issuance of this letter, several significant events occurred. In 1999, an access road, boat launch ramp, and parking lot were constructed at Antelope Point (identified as "Phase One" of the larger project). Meanwhile, NPS issued a solicitation for prospective developers to indicate their interest and qualifications for constructing and operating the project. Five developers were then selected to receive invitations to submit full proposals following issuance of a Request for Proposals (RFP) on October 27, 2000.

We disagree with the conclusions of the 1997 letter. We believe the same information and circumstances do not exist today as they did in 1986. The impacts have changed significantly since that time. Public involvement and participation were insufficient in 1986 and are not relevant to new information that has come to light in the interim. Therefore, additional consultation, study, and NEPA documentation are required.

The issues we will address include: Water Quality, Air Quality, Cultural Resources, Carrying Capacity, and Lack of Appropriate Consultation.

WATER QUALITY

Lake Powell stores Colorado River water behind Glen Canyon Dam, and that water eventually becomes a source of drinking water for millions of residents of California, Arizona, and Nevada. Water pollution in the Colorado River upstream is a source of great concern for municipalities. Millions of dollars are spent annually to remove pollutants and treat river water to comply with federal and state regulations. Thus, large development projects such as Antelope Point along Lake Powell's shoreline are a matter of potential concern for their potential to contaminate drinking water supplies.

The Antelope Point DCP/EA fails to evaluate the cumulative impacts of Antelope Point and other marinas on Lake Powell, in particular the potential for harm to water quality. Petroleum product spills and discharges from motorized watercraft, sewage overflows, runoff, human waste, and other sources of contaminants can have long-term negative effects that may defy standard emergency remediation measures.

Direct project impacts. The DCP/EA calls for boat slips to accommodate as many as to 300 boats (page 40). A boat launch ramp (which has since been constructed and was opened to the public in 1999) provides launching facilities for over 300 boats per day (page 89, Table 6, assuming all ramp traffic is outbound). Vessels utilizing the marina and launch ramp are mostly motorized and include houseboats, small boats, and personal watercraft (PWCs).

The DCP/EA (pp. 40-41) calls for constructing the following: a service station with six pumps and three tanks for fueling and repair; boat pump-out station; dock space for 60 small boat rentals, 60 houseboat rentals, and 2 tour boats; parking lots for a total of up

to 800 cars; campgrounds with space for 150 RVs; sewage system sized to service up to 225 lodge rooms, a restaurant, health club, cultural center, rental offices, retail shopping facilities, and up to 100 units of commercial residential housing.

Strong potential exists for significant direct water quality impacts from the development, including stormwater runoff from parking lots and other locations, fuel spills, and sewage system malfunctions. The DCP/EA notes the following on page 85:

"The development proposal would result in the installation of sewage treatment facilities, fuel storage tanks, and storage tanks for waste oils and fuels in a new area very close to Lake Powell. Leaks, seepage, storm-induced washout of containment structures, or careless operating practices could all result in contamination of lake waters. In addition, porous sandstone substrates at the site make ground water vulnerable to contamination from the same sources. To mitigate such potential impacts, the sewage treatment facility and hazardous materials storage must be located and designed to isolate possible effluents from surface and ground waters. Methods used would include substrate sealing, drainage control, and provision of surface containment structures."

Sewage system. The sewage system is described on pp. 54-55 as a "sealed evapotranspiration bed sewage disposal system," essentially an elaborate version of a septic system, with more than a mile of collection line. The sewage system would be constructed, with appropriate linings, near the water intake facility for Navajo Generation Station. The DCP/EA states on page 55, "alternative sewage treatment methods should be evaluated..." and offers a list of potential technologies that are variations on the septic tank model. However, despite the somewhat detailed description of the preferred system, the document leaves open to question what specific system would actually be constructed. Thus it is impossible to adequately evaluate the effectiveness of the proposed sewage system since the document clearly leaves the door open for an alternative system to be chosen at some later date.

Advances in technology over the last 14 years may have made possible a wider range of options to construct and operate an effective and reliable sewage system. A new environmental review is necessary to evaluate options that may be preferable to those presented on page 55.

Water Supply. The DCP/EA notes on page 53 that the water supply for the project will be two wells "drilled into Lake Powell bank storage." Given the highly porous nature of the surrounding soils and rock, there seems to be high potential for contamination of this supply. The document states on page 85, "Should unforeseen contamination [of the groundwater source] occur, the condition would be corrected or a new supply developed." The document fails to state what alternative sources are available and feasible for developing if serious groundwater contamination were to occur and the wells had to be closed.

Runoff. The potential for significant contamination from parking lot runoff and from other overland sources is great.

The DCP/EA states on page 84:

"Areas of shallow soil at the site have little capacity to absorb runoff. This factor, in combination with the addition of impervious parking lots and other hard surfaces, could lead to excessive erosional soil loss and consequent sediments in the marina unless drainage from all surfaces is carefully planned during the design phase."

The document discusses runoff in the form of soil erosion, but fails to address strategies to reduce or eliminate chemical-laden stormwater runoff from parking lots entering Lake Powell. The DCP/EA provides no data to evaluate the dimension of the risk posed to Lake Powell water quality by runoff from as many as 800 parking spaces across the project area.

The DCP/EA does not discuss specific measures that might be undertaken to minimize or eliminate the chances of sewage spills contaminating Lake Powell in the event of a pipeline rupture.

Onshore human waste impacts. The DCP/EA mentions human waste on shoreline campsite areas as a matter of concern. We note that since the document was written, numerous episodes of fecal contamination have occurred, especially in the early 1990s following significant changes in the reservoir's water level. Personal communications between GCNRA personnel and GCAN indicate that NPS believes that a significant percentage of the contamination events were caused by the inundation of fecal matter deposited by campers along the shoreline during periods of low water.

In the past year NPS has adopted measures requiring boaters to carry approved human waste containers. Floating dump stations have been provided at scattered points along the reservoir to encourage boater compliance with the new regulations. However few data yet exist to indicate the extent of compliance- particularly in the case of small boats which typically do not have installed toilet facilities. Furthermore, the widely fluctuating lake levels that occurred in the early 1990s have not occurred in recent years. No data yet exist to indicate whether the new regulations have had their desired effect in minimizing the amount of onshore human waste contamination. Only time and fluctuating lake levels will tell if visitors are in substantial compliance with the new regulations.

The DCP/EA fails to adequately evaluate the impacts of possible additional human waste contamination on Lake Powell's water quality from boaters launching at Antelope Point.

Personal watercraft and two-cycle motor impacts on water quality. Nearly all commercially available PWCs and many small boats use two-cycle motors. These motors have greater acceleration than the four-cycle engines found on larger boats and automobiles. Two-cycle engines use a combination of gasoline and motor oil for fuel. Operation of these engines is inefficient, however; a significant amount of fuel mixture passes through the pistons unburned and passes out the exhaust.

Water quality impacts of PWCs are a serious problem and one acknowledged by NPS and other federal and state agencies. The US Environmental Protection Agency (EPA) has stated that PWCs employing two-cycle motors routinely emit unburned fuel through their exhaust systems, in an amount equivalent to about 25% of the gasoline-and-oil mixture pumped into their tanks (documentation available from Bluewater Network). The PWC's exhaust system essentially injects an atomized spray of fuel into the jet of water that passes by the exhaust orifice. After passing through the jet, the contaminated water is thrown into the air, then falls back to the water's surface. Thus, for every four gallons of fuel consumed by a PWC, about a gallon ends up in the waterbody as exhaust. The total amount of unburned fuel dumped directly into Lake Powell by individual PWCs is staggering, yet goes virtually unnoticed by recreational users.

Earlier this year, NPS acknowledged the significant impacts of PWCs on park resources nationwide by issuing a new rule banning PWC use at many NPS units. GCNRA was granted an exemption from this immediate ban. NPS has acknowledged in personal communications with GCAN that a special PWC management plan for GCNRA will be prepared in the coming biennium to address growing resource protection and visitor safety impacts.

Regulators are beginning to take note. Recently the State of California initiated a ban on two-cycle PWCs at Lake Tahoe, out of concern for growing water quality problems traced directly to PWC contamination. Some local jurisdictions have banned PWCs from nearby waterbodies.

In September 2000, the US General Accounting Office issued a report titled, "Agencies Need to Assess the Impact of Personal Watercraft and Snowmobile Use," (GAO/RCED-00-243) documenting a widespread lack of information and monitoring by federal agencies, including NPS, of the impacts of this fast-growing sector of motorized recreation. Among the reports findings: (1) agencies have authority to assess the impacts of PWCs; (2) units report limited assessment of the impacts of PWCs; (3) agencies have not made collecting impact information a priority; and (4) existing information has identified adverse effects. The GAO recommends that federal agencies implement monitoring programs to generate information that can be used in developing appropriate management plans and minimizing the adverse impacts of PWCs.

The Department of Interior, in a letter to the GAO dated August 23, 2000, and signed by the Acting Assistant Secretary for Fish and Wildlife and Parks (Appendix IV), expresses general agreement with the GAO's recommendations (page 76). The letter also states that the NPS agrees with the report (page 77).

We find no mention in the Antelope Point DCP/EA of PWCs or of their impact. The marina is expected to attract large numbers of the craft. A new environmental review of the Antelope Point project must include a detailed analysis of PWCs' direct and cumulative water quality impacts. This analysis should evaluate anticipated increases in petroleum distillates and volatile organic compounds (VOCs) dispersed into Lake Powell by PWCs launched from Antelope Point.

Pollution from PWCs may already be significant at Lake Powell, even without the Antelope Point development. Currently no data exist which accurately reflect the extent of the problem. At this time, NPS' water quality monitoring program tracks only fecal coliform (indicators of human waste contamination), not petroleum products or VOCs. Before proceeding with the Antelope Point project, an adequate monitoring program must be put in place, and sufficient data collected and evaluated to provide meaningful information about the extent of existing pollutant levels and the potential for increases associated with Antelope Point development.

AIR QUALITY

Voluminous evidence exists to show that two-cycle engines are significant contributors to air quality problems. Not only do they emit large quantities of unburned fuel but they also emit significant amounts of combusted pollutants. Lake Powell is in the immediate vicinity of several Class One Air Quality regions (e.g. the Grand Canyon and Canyonlands National Parks).

In the years following publication of the DCP/EA, significant public debate and legal actions occurred, relating primarily to the effect of nearby Navajo Generating Station (NGS) on haze and visibility. NGS is a coal-fired power plant that produces up to 2200 Megawatts of electricity and is within direct line of sight of much of the project area.

The DCP/EA on pages 80-81 acknowledges that air pollution from offsite sources is already a problem at the site, but states that the development of Antelope Point would not "significantly affect air quality":

"Visibility is affected on some days through the presence of regional haze and/or a locally generated plume. Preliminary monitoring data indicate that the regional haze may originate from metropolitan areas and smelters of southern Arizona, and metropolitan areas of southern California. It is carried into the region through atmospheric long-range transport and reduces visibility. The local plume that affects visibility results primarily from nitrogen-oxides emissions of the Navajo Generating Station... None of the development alternatives would significantly affect air quality..."

"A local increase in gaseous emissions-carbon dioxide, hydrocarbons, and nitrogen oxides-is anticipated from the additional auto, truck, powerboat, and other internal combustion engine operations. Local air quality for gaseous pollutants including development of Antelope Point are well within the National Ambient Air Quality Standards (40 CFR, Part 50) presented in Table 5, (and the increases would be insignificant)."

"No emissions of ozone or sulfur dioxide would result from development."

The DCP/EA fails to provide any data that would indicate the specific estimated amount of air emissions anticipated directly or indirectly from development of Antelope Point. We therefore cannot determine the accuracy of the following unsupported claims that: (1) "local air quality for gaseous pollutants... are [sic] well within... [regulatory]

standards... and the increases would be insignificant," and (2) "no emissions of ozone or sulfur dioxide would result from development." Thus, more information is needed.

CULTURAL RESOURCES

Archeological resources. The DCP/EA indicates that significant archeological resources exist within the project area, and that some unavoidable damage to these resources would be required in order to construct the project as currently proposed. There is no explanation whether efforts were made to identify possible sites for development that avoided archeological resource sites altogether.

The FONSI itself states the following (page 143):

"1. This finding is contingent upon a successful mitigation of unavoidable impacts to the two identified archeological sites within the project area regardless of whether or not the sites are determined to be eligible for inclusion on the national Register of Historic Places. All construction activities related to these sites will not be permitted to commence until these sites have been properly mitigated."

The FONSI states that no significant impact would exist only if the two sites were successfully mitigated. However, it is not clear that any progress on mitigation has been made. In his 1997 letter, Mr. McMullen states on page 2:

"There is a need to complete mitigation of two cultural sites prior to any construction of facilities (Item 1 of FONSI). I have not been able to locate a report or information that indicates mitigation has been completed for Antelope Point."

The DCP/EA contains some detail which indicates (pp. 24-25) the significance and extent of Antelope Point's archeological resources:

"During the survey of the proposed 710-acre project area, 11 sites containing archeological artifacts, and 2 Navajo ceremonial sites that are still in use were recorded. ...

"Taken as a whole, the Antelope Point archeological sites seem to 'offer a possibility of filling in gaps in the chronology of the Glen Canyon area.

From the discussion it appears that Antelope Point has considerable archeological significance and thus deserves more detailed analysis in assessing the impacts of development at the site.

The document also states on page 92 the following:

"Two recorded sites would be directly, significantly affected by all three development alternatives. ... This site extends around much of the point along the shoreline and is unavoidable.

"The second directly affected archeological site is located within the marina development zone... This affected site is probably one of the most significant recorded

archeological sites on the point and is the only site believed to have potential for long-term occupation. ... [emphasis added] "

The DCP/EA does not make clear what mitigation might be considered sufficient to compensate for destroying such an important site. The document inadequately describes how NPS will assure compliance with Item 1 in the FONSI, i.e. successful mitigation of the two sites mentioned here.

Ceremonial sites. The traditional practices of medicine people are important elements of Navajo culture and heritage. The Dineh Medicine Men's Association, based in Window Rock, Arizona, has expressed its concern about proposed development activities on identified ceremonial sites as noted in the DCP/EA.

The document states on page 25 that a significant portion of the beaches in the project area are ceremonial sites:

"Another aspect of Antelope Point's cultural significance is its traditional and current continued use as a location for ceremonial rites. Accessibility, sandy beaches, and seclusion are the reasons Antelope Point is used for this purpose." However, some of the attributes that make this area attractive for ceremonial purposes (accessibility and beaches) also make it desirable for industrial recreational development. Construction of the marina and resulting increased visitor usage of the beach areas would render a significant amount of the ceremonial site unusable. The DCP/EA states the following (page 93):

"The development alternatives would preclude use of most of the Antelope Point beaches, which are within the Glen Canyon National Recreation Area, for traditional Navajo ceremonial rites. Much of the beach areas would actually be occupied by facilities, while most of the remainder would offer little or no opportunity for solitude once the development is in operation. However, at least one small, accessible embayment with a beach would remain, which could possibly be protected by fencing sufficient to offer solitude for ceremonial purposes. All three development alternatives are similar with respect to these impacts.

"The American Indian Religious Freedom Act requires consideration of impacts on traditional Navajo ceremonial sites. An alternative ceremonial site was identified and a plan developed to ensure seclusion from marina-related activities and intruders. These procedures were developed by the Navajo Nation and the National Park Service in consultation with LeChee Chapter and the Navajo Medicine Man Association...."

The DCP/EA does not explain whether attempts were made to locate alternative sites for the marina, but instead focuses on the proposed mitigation offered to the practitioners. It is not clear from the discussion whether the traditional practitioners with whom NPS consulted had agreed to the mitigation proposed (alternative ceremonial site) in the plan.

It is a matter of great concern to traditional practitioners when development projects intrude on these sites. In many instances, they believe that mitigation is simply not

possible. Traditionalists have long been concerned about visitation to areas used for ceremonial purposes.

Lake Powell flooded hundreds of miles of canyons that contained extensive archeological resources and ceremonial sites. Little effort was made to mitigate that significant harm. Now the government proposes destroying more sites to promote increased recreational usage at Antelope Point.

[The Dineh Medicine Men's Association of today is based in Window Rock, Arizona. It is not the "Navajo Medicine Man Association" that is mentioned in the DCP/EA.]

NPS must reinitiate consultation with traditionalists in order to determine whether damage to ceremonial sites can be adequately mitigated.

CARRYING CAPACITY

The development of a major marina will provide additional launching capacity for significant numbers of motorized watercraft users on Lake Powell. The DCP/EA discusses the concept of carrying capacity for the reservoir, which it defines on page 87-88 in the following way:

"The model was used to estimate levels of use where boat numbers would become constrained by either the natural environment or safety. These estimated use ceilings are the 'carrying capacity' of Lake Powell.

"Factors found to be most significant to carrying capacity at present include: the number of shoreline campsites; the distribution of boats into the Escalante Canyon and Rainbow Bridge areas; the distance of destination zones from launch sites and services (gas); boat safety; beach invasion by tamarisk and consequent loss of campsite; beach fouling by human waste; archeological site damage; and the types of boats launched ..."

Outdated information. The discussion of carrying capacity in the DCP/EA is largely confined to justifying the new marina's launch capacity as within the parameters established under a 1982 carrying capacity study. Subsequent to the completion of the DCP/EA, NPS completed another carrying capacity study (1987). We assume the data collected and analyzed in the 1987 study were not incorporated into the 1986 DCP/EA. In any event, the 1987 study is nearly as outdated as the 1986 DCP/EA.

Safety. The project site is along the old Colorado River channel, now a relatively narrow, winding arm of Lake Powell. Design considerations for the marina must take into account the narrow configuration of the channel to minimize chance of boating accidents.

In its discussion of anticipated carrying capacity impacts, the DCP/EA focused on boat launch rates as a means of quantifying effects on crowding. The document states on page 91:

"The principal effect of the Antelope Point development on Lake Powell would be to raise the capacity for downlake boat launches up to, but not exceeding, the lake's

estimated capacity to absorb such use under current management of the shoreline. Normally facility use at full capacity would only be expected during peak seasons. Nevertheless, these analyses indicate a need to consider additional management programs to alleviate boating impacts in concert with the phasing in of approved marina developments."

The DCP/EA acknowledges the potential for crowding problems at peak use times (despite the assertion that the project is within the reservoir's carrying capacity) and indicates that at some future date these concerns will probably have to be addressed. Thus we question whether the current plan is adequate to handle crowding problems.

Earlier this year, the Associated Press published an article describing Lake Powell as the second-most dangerous recreation area in the nation (after Lake Mead) in terms of deaths and injuries. Alcohol-related accidents are common and present a growing challenge to law enforcement on the nation's second-largest reservoir.

The explosive growth in popularity of PWCs over the last decade has made the craft a significant issue in safety impacts at Lake Powell. GCNRA officials have confirmed in personal communications to GCAN that PWCs account for a significant number of visitor complaints and safety concerns. PWCs are sometimes known as "thrillcraft" for their agility, fast acceleration and ability to make quick turns. They are all too frequently operated in a reckless manner in close proximity to other boaters, swimmers, or fixed objects.

The DCP/EA cannot be considered adequate until these new safety impacts are thoroughly evaluated and addressed.

LACK OF APPROPRIATE CONSULTATION

We note that the DCP/EA (pp. 138-139) indicates that no comments from any environmental advocacy organization were received in response to the Draft EA. Comments and responses listed in the DCP/EA generally did not address environmental impacts of the project. Two public workshops were held, one at the dam's visitor center near Page and the other at the Le Chee Chapter House near Page. Except for a list of individuals and organizations to which the Draft EA was mailed, it is not clear that NPS made a serious effort to solicit public comment from outside the immediate community of Page and Le Chee. It cannot therefore be concluded that NPS fulfilled NEPA requirements for appropriate public participation and consultation in 1986.

CONCLUSION

Based on the analysis above, we conclude that the DCP/EA is inadequate, outdated, and violative of NEPA. NPS should have prepared an EIS in 1986. The EA was inadequate then, only more so today. The amount of time that has elapsed since the document was written only underscores the need for updating and expanding upon the information originally presented.

The 1997 McMullen letter was insufficient to meet NEPA requirements. Before NPS makes any additional commitments of staff time and resources in pursuit of a

prospective developer for the project, we ask that the project instead be subjected to a rigorous review, and an EIS be prepared.

We also point out the need for expanding the current water quality monitoring program, particularly with respect to petrol.

Environmental groups criticize plan to rescue endangered fish

DENVER (AP) - A plan hailed as historic to save four rare species of fish in the Colorado River Basin is running into opposition from two environmental groups.

The U.S. Fish and Wildlife Service is considering a plan to rescue the humpback chub, bonytail chub, razorback sucker and Colorado pikeminnow. The fish inhabit the Colorado River and its tributaries in Arizona, California, Colorado, Nevada, New Mexico and Utah.

Its plan was hailed by states, water users and Gov. Bill Owens.

But two groups, Utah-based Living Rivers and the Desert Fishes Council, say the goals are not ambitious enough to save the fish.

The proposals call for restoring fish populations, providing enough water at the right temperature, protecting their habitat, curtailing threats from nonnative fish and parasites, and keeping pollution out of the rivers.

"We're concerned that the agency, in its eagerness to please water and power interests in the seven Colorado River basin states, is rushing to set criteria that will cost

taxpayers millions more dollars while not helping recover the fish they're supposed to be saving," said David Orr of Living Rivers.

The group has outlined several criticisms. It said the plan places too much reliance on hatcheries to increase fish numbers; not enough habitat restoration; and not enough attention on removing invasive fish.

Dave Probst of the 300-member Desert Fishes Council said his group thinks the agency should require higher levels of fish before taking them off the endangered species list.

Robert Muth, director of the Colorado River endangered fish recovery program, said the concerns will be considered.

Flap Over Endangered Fish

Activists say proposal to save species in river doesn't go far enough

By Todd Hartman

Rocky Mountain News Staff Writer

A recently crafted plan hailed as a breakthrough in saving four rare species of Colorado River fish is running into fresh opposition from biologists and environmentalists in the Southwest.

The criticism comes as the U.S. Fish and Wildlife Service tries to put the finishing touches on "recovery goals" for four species of obscure fish that are the targets of a \$100 million rescue effort -- one of the costliest such programs in the West.

The recovery goals lay out how many fish are needed and what projects must be completed for the four species -- the humpback chub, Colorado pikeminnow, razorback sucker and bonytail -- to someday thrive in the Colorado River and its tributaries, including the Gunnison and Yampa rivers on the Western Slope.

States, water users, power providers and some environmentalists have generally praised the goals as a major step in preserving the fish. Gov. Bill Owens' administration was among those pushing hardest for the goals, arguing they're crucial if the fish are ever to be taken off the endangered species list.

Suddenly, though, the plan is under fire from two groups.

Living Rivers, a Utah environmental group devoted to restoring the Colorado River to more natural conditions, and a nationwide group of biologists called the Desert Fishes Council, now say the goals aren't ambitious enough to save the fish species that once ruled the river from Colorado's Western Slope through the Grand Canyon.

"We're concerned that the agency, in its eagerness to please water and power interests in the seven Colorado River basin states, is rushing to set criteria that will cost

taxpayers millions more dollars while not helping recover the fish they're supposed to be saving," Living Rivers' David Orr said Tuesday.

Orr's group outlined several criticisms, including too much reliance on hatcheries to increase fish numbers; not enough habitat restoration, such as removal of dams that block fish migration; not enough attention to removing non-native, invasive fish that out-compete the rare species; and not enough emphasis on fish populations below Lake Powell.

Dave Propst of the 300-member Desert Fishes Council said the group takes issue with several elements of the goals. Top among them: whether the agency's numerical population goals to mark when the fish can come off the endangered species list are set high enough.

Robert Muth, director of the Colorado River endangered fish recovery program, said the concerns of the groups will be taken into consideration, along with others, as the agency puts together a final version of the recovery goals in the coming months. But he took issue with some of the criticism, particularly from Living Rivers.

"My overall response is that they have not read the recovery goals very well," Muth said. "All these points are addressed very well in my mind."

He cited complaints about over-reliance on hatchery fish as an example. Two of the species -- the razorback sucker and bonytail -- are down to so few specimens in the wild that cranking up numbers using hatcheries is crucial to preserving the creatures.

"A lot of people said, 'We don't like (the goals),' " Muth said. "But they haven't really given guidance to how to change them and for what reasons."

A demand of both Living Rivers and the Desert Fishes Council is for an outside, independent "peer review" of the science included in the recovery goals.

But Muth countered that the goals have been available for public comment for months, and anyone is welcome to scrutinize them. Indeed, he said, many individual biologists -- including some associated with the Desert Fishes Council -- have submitted criticism of the science on their own.

"The stack (of comments) is growing every day," Muth said.

Traditional Water Users Call for Reforming CO River Management

THURSDAY, DECEMBER 13, 2001 11:30 a.m. to 12:30 p.m. TERRAZZA LOUNGE, on the CASINO LEVEL at the base of the escalators leading to the conference area)

CAESARS PALACE HOTEL & CASINO LAS VEGAS, NEVADA (Formerly scheduled for SENATORS BOARDROOM)

CONTACT: Lisa Force, 602-321-1753 (cell) David Orr, 435-260-2590 (cell) Owen Lammers, 435-259-1063

WHILE COLORADO RIVER INDUSTRIAL WATER USERS MEET IN LAS VEGAS, TRADITIONAL USERS CALL FOR REFORMING COLORADO RIVER MANAGEMENT

For many years, the major stakeholders in Colorado River water use have gathered annually for a conference in Las Vegas. The group, however, has represented the interests of dam operators, large water districts, and corporate agri-business.

At this year's conference, scheduled for December 12-14 at Caesars Palace Hotel, the members of the Colorado River Water Users Association (CRWUA) will be joined by a contingent of formerly unrecognized stakeholders: representatives of Indian Nations, Mexican delta communities, and environmental and social justice groups concerned with Colorado River laws and practices.

These groups will hold a news conference Thursday, December 13, at 11:30 a.m. to introduce members of the news media to critical issues of water allocation and environmental protection that are not being addressed by the Water Users Association and the state and federal agencies that support them.

"Colorado River water users and agencies need to recognize the pressing water needs of indigenous people and communities in Mexico and the US," stated Lisa Force of LIVING RIVERS, who will be moderating the press conference. "Flows to the dried-up Colorado River delta need to be restored, and plans to construct additional reservoirs such as the Animas-La Plata project in Colorado should be abandoned."

Other speakers at the news conference will include advocates for protection of tribal water rights and cultural resources, preservation of delta communities, and restoration of endangered wildlife and fish populations.

"Ecosystem restoration is feasible in the Colorado River delta," stated Ms. Yamilett Carrillo-Guerrero, of ProNatura Sonora, a Mexican environmental protection group, and a native of the Colorado River delta region. "Local communities in the delta are open to alternative uses in their land, compatible with the restoration of the ecosystem. Mexican farmers realize the importance of instream flows and in their modest possibilities, they are ready to contribute with land and water to help restore the riparian forests and wetlands in the Colorado River delta. For them, a river with water means life and in no way do they consider water nurturing the Colorado River delta wetlands and the Upper Gulf of California as wasted water."

Joining Ms. Force and Ms. Carrillo-Guerrero will be Mr. Kevin Doyle, Director of Habitat Conservation Programs with the National Wildlife Federation, the nation's largest conservation and education organization. "While restoration of the delta to its former glory may sound like a pipedream to some," said Mr. Doyle, "incremental steps to

provide more water for this beleaguered ecosystem can have a dramatic impact on the region's biodeiversity. Despite the currently dessicated state, the delta is still a critical stopover for birds in the Pacific Flyway and the last fringe habitat on Earth for some endangered species. Already, we've seen the comeback of numerous wildlife species in the delta's Cienega de Santa Clara with just limited efforts to provide more water."

Mr. Chad Smith, representing the Ahamakav Cultural Society and Inter-Tribal Waters Organization, based in Mohave Valley, Arizona, will also speak at Thursday's news conference.

"The many water agreements, regulations, and projects that the Federal government and special interests have negotiated are actually a part of one phenomenon, the taking of water from the Colorado River ecosystems and from smaller, more rural users," stated Mr. Smith. "For example, the Fort Mojave Tribe opposes the three interrelated agreements: the Interim Surplus Criteria, the Quantification Settlement Agreement and the Cadiz Groundwater Storage Project... These are all for just one constituency: the large population along the coastal plain."

Also presenting will be Gilbert Sanchez, of Tribal Environmental Watch Alliance, an indigenous organization based in New Mexico. Mr. Sanchez is fighting to protect environmental and cultural resources and sacred sites from water development projects.

"The cultural heritage of Indian people is threatened by new water development projects like Animas-La Plata," stated Mr. Sanchez. "We have watched over the years as one dam after another has been built, pipelines and canals have been dug, while we see the graves of our ancestors dug up, artifacts taken, and sacred sites desecrated. All this damage, and for what? Much of this water is stored just to evaporate into the sky, and much of what is used is wasted. The resting places of the ancestors should not be sacrificed for more golf courses, backyard swimming pools and hayfields in the desert."

SPEAKER INFORMATION

LISA FORCE of LIVING RIVERS will moderate the Press Conference. As Program Director for LIVING RIVERS, Ms. Force, organizes environmental advocacy campaigns in the southwestern United States and Mexico. Ms. Force helped to assemble the "Coalition for Delta Restoration" with 133 groups representing 12 million people in the U.S. and Mexico – the largest coalition ever organized in defense of a North American river system. Before joining LIVING RIVERS, Ms. Force was a regional director for the Center for Biological Diversity, recognized as the most effective endangered species advocate in the Western United States. During her time there, she organized and led a successful campaign to decommission two hydroelectric power plants in central Arizona.

YAMILETT CARRILLO-GUERRERO, of ProNatura Sonora, a Mexican environmental protection group has spent the past four years working on wetland restoration and public advocacy of the Colorado River delta. Her current project is restoration of a wetland on privately-owned property on the Hardy River in the Mexican delta. Before

joining Pronatura, Ms. Carrillo-Guerrero worked for the prestigious Center for Conservation of Natural Resources (CECARENA-ITESM) in Guaymas, Sonora. Ms. Carrillo-Guerrero is also assisting Don Onesimo, the Cucapá Traditional Chief at El Mayor in the Mexican delta, in authoring a book of Cucapá legends that explain the relationship between the tribe's culture and survivorship and the changes in the Colorado River delta.

KEVIN DOYLE is the Director of Habitat Conservation Programs for the Western Field Office of the National Wildlife Federation (NWF) - the nation's largest conservation and education organization. His work focuses on the protection of biological diversity through smart growth and habitat conservation planning, watershed protection, and proper management of public lands. Prior to joining NWF, he worked on air and water quality initiatives in California, including the landmark CalFed process. He spent six years with The Nature Conservancy, in Rhode Island and Hawaii, where he worked on invasive species prevention and control. Kevin served three years in the Peace Corps working for a joint USAID/National Park Service conservation program in Burundi, Africa.

GILBERT SANCHEZ is Director of the Tribal Environmental Watch Alliance (TEWA), an indigenous environmental organization based in Santa Fe, New Mexico. Gilbert is a former tribal official with the San Ildefonso Pueblo, where he resides. Long active in a variety of environmental and social justice issues—including efforts to restore tribal lands taken from his pueblo for the Los Alamos National Laboratory, Gilbert and TEWA are working to protect the lands, air and waters of the ancestral homelands of his and other indigenous peoples of the Southwest.

CHAD SMITH is the Tribal Archeologist and Cultural Resource Manager for the Fort Mojave Indian Tribe. An archeologist since 1978, Mr. Smith has served as archeologist for the Department of Interior's Navajo Newlands, the Navajo Nation Historic Preservation Department, and the San Carlos Apache Tribe. Mr. Smith is of White Mountain Apache descent and has learned the traditional ways of the Tribes for whom he has worked, including their views on water and water use. Mr. Smith represents the Fort Mojave Tribe in the new multi-Tribe organization, InterTribal Waters Protection Network.

Comments on Recovery Goals for CO River Endangered Fish

Dr. Robert T. Muth, Director Upper Colorado River Endangered Fish Recovery Program
ES/Colorado River/MS 65115 U.S. Fish & Wildlife Service P.O. Box 25486 Denver
Federal Center Denver, CO 80225

Re: Comments on U.S. Fish & Wildlife Service (USFWS) Draft Recovery Goals for
endangered fish of the Colorado River basin (published September 10, 2001)

Dear Dr. Muth:

LIVING RIVERS submits the following comments in support of recovering four listed, endangered fish species native to the Colorado River: bonytail, Colorado pikeminnow, humpback chub, and razorback sucker.

We note that recent data from the Grand Canyon Monitoring & Research Center indicate a steeply declining population trend for humpback chub in Grand Canyon. This is a warning sign that current efforts in the lower basin (at least) are not protecting the fish, much less providing for their recovery.

The U.S. Fish & Wildlife Service (USFWS) has primary responsibility for ensuring the protection and recovery of these species. We call on the agency to reconsider its current strategies and devise effective, workable solutions that will assure survival and recovery of the humpback chub and the three other species that are currently absent from Grand Canyon.

Regarding the draft recovery goals, we request that the USFWS submit them to an independent, external scientific peer review panel before final publication. The panel should consider also all comments submitted in response to the draft document.

Because of the seriousness of the fishes' plight throughout the Colorado River basin, LIVING RIVERS requests the USFWS prepare a basinwide Environmental Impact Statement (EIS) to address recovery goals throughout the fishes' historic ranges. An effective and adequate recovery goals document must necessarily address a wide range of water management issues throughout the basin. Because the implementation of the recovery goals for the four listed fish--a federal action--necessarily entails significant impacts to water management, dam operations, and other environmental factors, the agency is required by law to prepare an EIS.

LIVING RIVERS opposes adoption of the recovery goals in their current form. We believe that, in general, the USFWS has emphasized too much the use of hatcheries and pond rearing to achieve numerical population increases, while ignoring the need to restore suitable habitat across the fishes' historic range. A true recovery plan must ensure that sufficient habitat is available to give species the greatest hope for survival over the long term.

1) LOWER BASIN CONCERNS: In the draft, USFWS emphasizes recovery of viable populations in the upper basin at the expense of lower basin populations, which have long been at much greater risk. The draft recovery goals appear to reflect an agency assumption that little can be done in the lower basin besides continuing the hatchery stocking program. USFWS must make recovery a priority in the lower basin as well as the upper basin, and must not permit downlisting/delisting of the fish so long as lower basin populations remain endangered. In addition, the USFWS must consider the Colorado River delta below Morelos Dam as potentially suitable habitat, and require that stream flows and viable populations be restored to that reach of the river in Mexico before recovery can be deemed to occur.

2) EMPHASIZE WILD FISH: The USFWS should give more attention to protecting and encouraging propagation of extant populations of wild fish, as opposed to hatchery-

raised fish. Over the long term, much more robust and genetically diverse populations are likely to result from wild fish. Recovery goals should require wild populations and aggregations to be viable and reproducing.

3) **STUDY DAM REMOVAL/DECOMMISSIONING:** In that light, LIVING RIVERS calls on the USFWS to address the need for removing dams throughout the Colorado River basin, as an obvious and beneficial way to restore potentially large areas of suitable habitat. Dam decommissioning can make available habitat that is currently inundated by reservoirs, as well as improve conditions in reaches downstream of dams. Dam removal will allow for re-establishing long-blocked fish migration routes, which may be beneficial for the Colorado pikeminnow, in particular.

In the Grand Canyon in particular, the benefits to the endangered fish of decommissioning Glen Canyon Dam must be considered as part of any long term recovery effort. Hundreds of stream miles above and below the dam could be made habitable once again with this single restoration strategy. Other dams in the basin should be studied for removal/decommissioning as well, including Navajo Dam on the San Juan, Flaming Gorge on the Green River, and one or more of the lower basin dams below Hoover (e.g., Laguna). USFWS cannot ignore the benefits of these undertakings.

4) **DOWNLISTING/DELISTING:** We fear that the emphasis on strict numerical targets, coupled with the reliance on hatcheries to produce maximum numbers of fish in the shortest period of time, reflects the intense political pressure on the agency to downlist and delist the fish at the earliest possible date. We urge USFWS to back away from the timetable-driven, "by-the-numbers" approach to recovery that is so evident in the draft goals document. Apparently healthy populations have been known to precipitously crash when diseases or environmental disasters occur. A habitat restoration-oriented model is much more likely to benefit species in the long term. Recovery goals should place as much emphasis on ensuring that a maximum amount of additional suitable habitat is made available, as on counting fish. Once downlisting or delisting has occurred, it is often much more difficult to protect populations from unforeseen disasters.

5) **STUDY BENEFITS OF REDUCING DIVERSIONS & DEPLETIONS:** The Upper Colorado River Endangered Fish Recovery Implementation Program has emphasized that endangered fish management strategies are designed to permit additional water storage and diversions in the future. LIVING RIVERS calls on USFWS to abandon this policy, as it biases the agency against considering potentially substantial recovery benefits. The USFWS should analyze in detail the expected benefits to the fish of reducing current diversions (and overall depletions), and provide a range of alternative scenarios for instituting cutbacks on water deliveries to aid fish recovery. Such criteria would be especially valuable in dry years when streamflows are dramatically reduced, and fish are often stressed.

6) **REMOVE NON-NATIVE COMPETITORS AND PREDATORS:** The USFWS should emphasize an aggressive program to remove introduced, non-native fish that compete with and prey on endangered fish. Much scientific work remains to be done to determine

effective strategies for doing this, yet very little is currently being done. Indeed, throughout much of the upper and lower basins, "game fish" are still encouraged and stocked by state fish management agencies. USFWS should make recovery dependent on limiting or eliminating non-natives, including trout and other game species, wherever appropriate to achieve recovery.

Thank you for the opportunity to submit these comments. We look forward to publication of the final recovery goals, and we urge you to address the substantive issues we have raised, and implement all of our suggested changes.

Thank you for your consideration,

David Orr Director of Field Programs LIVING RIVERS PO Box 466 Moab, UT 84532

Grand Canyon native fish at risk of extinction

Grand Canyon native fish at risk of extinction
Federal recovery goals provide no help

MOAB, UTAH (Dec. 10) -- The environmental and social justice advocacy organization LIVING RIVERS sent a letter today to the U.S. Fish & Wildlife Service (USFWS), warning of plummeting humpback chub populations in the Grand Canyon, and called for major revisions in its draft recovery goals for the humpback and three other species of endangered Colorado River fish.

Data from the Grand Canyon Monitoring and Research Center (GCMRC) indicate a rapidly declining population trend for humpback chub in the Little Colorado River, the largest and only known successfully-reproducing population of their species. GCMRC researcher Lew Coggins recently announced that numbers of reproducing humpback chub are in a "steeply declining trend." Coggins' investigation found only about 500 individuals of reproducing age. He stressed that it is too soon to draw conclusions about whether the population may have dropped below the point where it can rebound.

Three other listed species, bonytail, Colorado pikeminnow and razorback sucker, have been extinct in the canyon for years.

"Despite spending millions of dollars over the years, the government has failed to protect and recover Grand Canyon's native fish," said David Orr, director of field programs for LIVING RIVERS. "Will the last of the endangered species have to disappear before changes are made?"

LIVING RIVERS' letter criticized the agency's draft recovery goals for the four fish species, and called on USFWS to subject its recovery goals to independent, external

scientific peer review. The goals were released for public comment on September 10 and ended today.

"Politics, not science, is driving the process," said Orr. "To ensure the survival and recovery of wild native fish, the agency must produce a scientifically sound plan. The proposal currently on the table doesn't come close."

The Desert Fishes Council, a prestigious scientific organization dedicated to preserving biological diversity in desert aquatic ecosystems, passed a resolution at its annual meeting last month in Alpine, Texas, opposing the draft recovery goals as currently written. The organization also called for outside peer review.

LIVING RIVERS' additional concerns include:

- * Failure to emphasize restoration of habitat, including removal of dams that block fish migration and spawning areas, and that release water too cold for fish to survive in.

- * Reliance on hatcheries and other artificial reproduction methods to increase fish numbers and downlist or delist species, even though fish may not survive to reproducing age.

- * Lack of attention to removing introduced, non-native fish that compete with and prey on endangered fish.

- * Failure to require recovery of the species throughout their ranges in both the upper and lower Colorado River basins.

"We're concerned that the agency, in its eagerness to please water and power interests in the seven Colorado River basin states, is rushing to set criteria that will cost taxpayers millions more dollars while not helping recover the fish they're supposed to be saving," said Orr.

#

LIVING RIVERS works to build a broad-based constituency for large-scale restoration of the Colorado River and neighboring watersheds. LIVING RIVERS has assembled a coalition of 133 U.S. and Mexican environmental and community groups, representing more than 12 million people, in support of Colorado River delta restoration.

Comments: Not So Immediate Options for the Delta

In May, 2001 a preliminary report was released by Michael Clinton Engineering prescribing "immediate" solutions for Colorado River Delta restoration. Living Rivers, The Center for Biological Diversity, the Cocopah Indian Tribe and Centro Regional de Estudios Ambientales y Socioeconomicos, A.C. found numerous deficiencies in the analysis conducted and solutions proposed, and prepared the comments below.

To download a pdf of the report in question **Immediate Options for Augmenting Water Flows to the Colorado River Delta in Mexico**

December 5, 2001

Michael Clinton
Michael Clinton Engineering
3004 Harbor Side Drive
Las Vegas, NV 89117
Dear Mr. Clinton:

Thank you for the briefing at the Colorado River Delta Symposium in Mexicali in September concerning your report "Immediate Options for Augmenting Water Flows to the Colorado River Delta in Mexico".

We very much commend you for beginning a process to explore options for getting additional water flows to the Colorado River delta in an immediate timeframe. We also appreciate your acknowledgement that immediate partial solutions are only valuable in the context of a longer-term, more holistic solution.

As discussed during the briefing, several factors are crucial to a more holistic approach, including acceptance by U.S. entities that additional water will have to flow across the border through the main channel; recognition that environmental issues are entwined with social issues; incorporation of the gulf and estuary ecosystem into proposed solutions; and an acknowledgment that a comprehensive solution must include lower water consumption on the US side. However, we recognize that the report is intended to address only short-term solutions and we will confine our comments to that objective.

We applaud the research effort undertaken to produce this report. We remain concerned however with the report's apparent over-emphasis on the likelihood that its recommendations will alleviate imminent threats to important delta wetlands. In fact, report recommendations will provide substantial environmental benefits through creation of new brackish wetlands. But the recommendations will not alleviate impending harm to the two most threatened delta wetlands, the Cienega de Santa Clara and riparian corridor, and may increase threats to these areas.

Overall, the report would benefit from a wider examination of possible water sources for priority delta wetlands. Recommendations should focus less on what report authors consider to be politically possible and more on all available sources, albeit with the understanding that these will obviously provide much less water than that necessary for a longer-term solution.

Background and Imminent Threats

Even short-term solutions should be directed at specific ecological problem areas within the delta. The report should indicate that the "Colorado River delta" is an often-used generic term referring to the following four particular priority wetland conservation areas:

- Cottonwood /willow riparian corridor between Moreles Dam and the Rio Hardy;
- Cienega de Santa Clara;
- Intertidal wetlands, including historic estuary at river's mouth;
- Various brackish wetlands

Each of these areas has very specific water needs and provides very specific ecosystem benefits. These need to be outlined in the report in order to avoid making blanket recommendations that may benefit some areas but cause harm to others.

Further, the report should incorporate recommendations from the Binational Declaration (see attached) distributed at the Mexicali Symposium, specifically:

- A framework for research to determine the amount, quality, and timing of water deliveries necessary to sustain and restore the Colorado River delta's ecosystems, including the riparian corridor below Morelos Dam, the Ciénega de Santa Clara, the River's estuary, and other brackish wetlands.
- Efforts to secure funding both for research needed to develop alternatives to protect and restore Colorado River delta's ecosystems, and for the implementation of those alternatives.

The Colorado River riparian corridor downstream of Morelos Dam, and the Cienega de Santa Clara are the two most threatened wetlands in the Colorado River delta region. The riparian corridor with its abundant cottonwood and willow vegetation faces several imminent threats, including fire from nearby garbage dumps, desiccation from reduced river flows, and increasing soil salinity. Additionally, the riparian corridor receives inadequate and inconsistent flood flows and therefore experiences little recruitment of new native woody vegetation necessary for sustained survival of the riparian corridors. These threats could greatly diminish or eliminate native cottonwood and willow riparian vegetation in the corridor in just a few years, depending on spills or floods from the U.S.

The Cienega de Santa Clara faces an imminent threat from the proposed operation of the Yuma Desalting Plant. In recent public meetings, the Bureau of Reclamation (BoR) has clearly stated its intent to recommend to Congress operation of the Plant, an action that could destroy the Cienega de Santa Clara. Yet the report states that "Operation of the [Yuma Desalting] Plant is not anticipated in the foreseeable future...therefore that contingency is not considered in this report." (p. 13)

The Cienega could be greatly reduced or lost in just a few short years with operation of the desalting plant and the resulting severe reduction in quantity and quality of Wellton-Mohawk drainage water delivered to the Cienega. This was demonstrated in 1993 when flow to the Cienega was interrupted for canal maintenance, causing the vegetated portion of the wetland to shrink from 11,200 acres to 2,750 acres in just a few months time.

Time Frame

The report suggests that the recommended measures be continued no longer than the term of the Interim Surplus Criteria, indicating that the intended time frame for the "immediate" options described in the report is 15 years. The term "immediate" is obviously open to broad interpretation, but report recommendations will not alleviate pending threats to the riparian corridor and the Cienega in a 15-year time period.

The authors' proposed 15-year time frame would provide ample time to identify and implement a long-term solution with much greater benefits than those contemplated in

the report. A long-term solution for delta wetland conservation, attainable in 15 years, might include conserving water in the U.S. and Mexico for delivery to delta wetlands through fallowing, increased agricultural efficiency, water recycling and other methods.

Further, the report states that "US water users want assurances that a more comprehensive Delta plan does not require additional water from the United States." (p.33). Successful implementation of report recommendations would not justify assurances to water users that no action will be taken to obtain additional water for a 15 year period.

Complexities with Water Sources

The benefit of 15,000 acre feet as applied to the delta riparian corridor is unknown, and may be very limited due to the amount of water necessary to maintain riparian vegetation and to reverse and maintain low soil salinity. The best available scientific data suggests that a minimum average annual flow of approximately 106,000 acre feet per year are necessary to retain the delta riparian corridor. Specifically, flows of 32,000 acre feet per year below Moreles Dam plus pulse flows of 260,000 acre feet, released at a rate of 3,500-7,000 cfs, at three to four year intervals are the minimum needed to sustain riparian corridor vegetation.

Further, the proposed 15,000 acre feet of fresh water from Mexico is unlikely to be obtained on a schedule necessary to prevent significant habitat loss in the riparian corridor. Report recommendations for obtaining fresh water from retired, marginal agricultural lands in Mexico are very complex.

Potentially Harmful Recommendations

The report refers to release of brackish waters into "the delta" generically. Again, even short-term solutions need to be directed at specific priority conservation areas within the delta as they have very different water quality, quantity and pulse regime needs. The report indicates that the Yuma area brackish water will be delivered to the "Colorado River wetlands" and that there exists a need for confirmation that the brackish water will be of sufficient quality to sustain the stands of riparian vegetation (cottonwoods and willows). Additionally, the report suggests that a 14-mile connector canal from the Bypass Drain to the Plan Ayala Drain would need to be constructed to deliver this water.

As discussed previously, brackish water will not benefit, and in fact is likely to greatly harm cottonwood and willow vegetation if applied to the riparian corridor. It is imperative that any reference to the use of brackish water for the riparian corridor be eliminated.

The report also suggests that occasionally, the entire flow of the Bypass Drain could alternate between the Colorado River wetlands and the Ciénaga de Santa Clara allowing the water now entering the Cienega to be delivered in surges. It is unclear what is meant by "Colorado River wetlands", however in referencing the Colorado River delta, the term includes cottonwood /willow riparian corridors, the Cienega de Santa Clara, intertidal wetlands, and various brackish wetlands.

Riparian corridor wetlands benefit from pulse flows while marshes likely do not. Therefore, the recommendations for periodic pulse flows between the Cienega and new brackish wetlands are unlikely to benefit these wetlands, and actually may harm the Cienega, as discussed above, by periodically diverting its source to other wetlands. Depending on how long flows were diverted to other brackish wetlands, the Cienega de Santa Clara could shrink again, most affecting populations of the endangered desert pupfish occupying very shallow areas around the periphery of the Cienega.

The recommendation to apply pulse flows to the Cienega appears to be the result of confusion by the authors over which wetlands would benefit from this type of management. The riparian corridor is the wetland that would benefit from pulse flows.

Important Legal Obstacles

The report neglects to address the fact that there is no guarantee that the proposed brackish water deliveries from Yuma will not themselves be subject to the same legal challenges from water users as were the water to be going through the main channel. This is a possibility especially if the replacement water is to come from Lake Mead.

Consumption Issues

Extremely inefficient water use on the U.S. side is well documented, especially for the agricultural sector. Any sustainable solution for the delta and gulf must address reducing water consumption in the U.S. The omission of any discussion of water utilization, and the role it can and must play in the future of the delta, ignores both the major challenge to, and significant potential for, restoration.

There are also recycling opportunities to be considered. Waters presently available through industrial discharge in both Mexico and the U.S. can be treated and used as secondary sources to be mixed with any initial U.S. contribution. Further, water used by power plants on both sides of the border could potentially be recycled. Of course, water quality criteria as well as flow rate and seasonal criteria must accompany any exchange of treated waters between the two nations. Mexicali-based industries have expressed a desire to consider this option.

Inequitable Burden on Mexico

Mexico faces even greater demands for Colorado River water than does the U.S., given the allocation to Mexico of only 1.5 million acre feet annually and the heavy dependence on Colorado River water for agricultural, fishing and municipal use by low-income communities with few alternatives. The recommendations of this report, which include 15,000 acre feet of fresh water from Mexico compared with only 38,000 acre feet of brackish water from the U.S. place an inequitable burden on Mexico. The report should outline scenarios in which the U.S. and Mexico are contributing water to the delta in amounts proportional to their allocation.

Social Needs are Overlooked

The needs of local communities including fishing associations and ejidos are entwined with environmental issues. The local delta residents are able to offer creative solutions as their livelihoods depend upon healthy delta habitats. The report overlooks such opportunities. For example, restoration of estuaries, one of the most vital environmental and social-needs resources of the delta region, is not mentioned.

Also, the poorest communities may suffer greatest harm under the report recommendations. The poorest lands often support the poorest communities. These are the Mexican agricultural lands targeted for retirement under the recommendations.

Local Groups Were Not Included

Although the report states that "...the involvement of local communities and NGOs is essential" (p.33), Mexican communities and environmental groups located in the delta were not included in its development, nor were representatives of the Cucapa Nation. Several local communities, Non Government Organizations, fishing cooperatives have expressed grave concerns about the recommendations in the report. They have stated that they are not at ease with the alternatives in the report being the only ones under consideration.

In conclusion, this report is valuable in helping to begin a discussion of specific actions that might lead toward restoring the delta. If this process is to continue, we urge the Sonoran Institute and Michael Clinton Engineering to communicate a more thorough understanding of the biological needs of the four priority wetland conservation areas. Recommendations for more water for the delta should be specific to the type of wetland targeted in order to be effective and to avoid harm. The Institute may wish also to undertake a more thorough study of creative alternatives for immediate sources of water, taking into consideration the points outlined above, before proceeding towards implementation of the report recommendations

Thank you again for sharing this report with us, and giving us the opportunity to offer our comments.

Sincerely,

David Hogan, Center for Biological Diversity

Rally for Grand Canyon Restoration

Friday, January 18, 2002, 11:30 am

Arizona Center II

5th St and Van Buren

Downtown Phoenix

Join LIVING RIVERS and others as we send a message to federal and state agencies, and water and power interests that will be gathering in Phoenix, January 17-18, 2002. This group has been convening for the past five years, charged with developing strategies to heal the Colorado River through Grand Canyon. The ecosystem does not lie, this group is failing.

It's critical that the public let them know that the time for action is NOW!

- Stop killing the Grand Canyon.
- Save the riparian habitat.
- Recover endangered fish.
- Bring back the canyon's beaches.
- Restore the natural process, before it's too late.
- Save this world renowned national park.

New information reveals that yet another species is on the verge of extinction in Grand Canyon National Park, the humpback chub. The Fish and Wildlife Service has decided that their priority for these and other declining fish species is not necessarily to restore natural habitat conditions. The agency would rather attempt to dump hatchery-raised fish into rivers with the hope to maintain an artificial population. These fish won't be able to reproduce in the Canyon, and it is questionable if the hatchery fish will survive at all. This is not restoration, it's a mechanism for water and power interest to continue destroying our rivers, and in the process, circumvent the Endangered Species Act.

Help prevent unneeded new development at Lake Powell

The National Park Service is promoting a massive, environmentally destructive new resort at "Lake" Powell Reservoir near Page, Arizona. Now is the time to submit comments on the Antelope Point Marina project.

SUBMIT YOUR COMMENTS TODAY (details below)

MOAB, Utah, Nov. 27 -- The National Park Service (NPS) is currently accepting public comments on the proposal to build Antelope Point Marina, a sprawling resort planned for the desert shores of Lake Powell Reservoir in Glen Canyon National Recreation Area (GCNRA) near Page, Arizona. Citizen groups are protesting the project's social and environmental impacts, and calling for a full study of alternatives to the proposed action.

The Antelope Point project is currently undergoing review for an Environmental Assessment (EA) to help the agency identify and analyze expected project impacts. LIVING RIVERS and other groups are urging citizens to write the Park Service to express concerns about this unneeded, polluting facility that would be built within a National Park recreation area.

Organizations that have already come out in opposition to the project include: Bluewater Network, Colorado Plateau River Guides, Diné CARE (Citizens Against Ruining the Environment), Diné Medicinemens Association, Escalante Wilderness Project, Flagstaff Activist Network, Grand Canyon Private Boaters Association, LIVING RIVERS, Sierra Club, Utah Environmental Congress and Wild Wilderness. [Other groups wishing to join this coalition, please contact LIVING RIVERS at]

The National Environmental Policy Act (NEPA) requires project proponents to consider a range of reasonable alternatives to the proposed project. The Antelope Point project is based on an assumption embedded in the park's 1979 General Management Plan

(GMP), that another large marina is needed near Page. The existing Wahweap Marina facilities could be expanded to accommodate additional demand, rather than construct a new resort nearby. Antelope Point will essentially duplicate existing services at Wahweap.

The project, which would be built partly on national parkland and on land controlled by the Navajo Nation, includes the following features:

More than 250-300 commercial houseboat rental slips, space for 60-100 rental houseboats and 60-70 small boats, 2 large tourboats, fuel dock and pumpout facilities, marina store, restrooms, launch ramp, parking for 800 vehicles, sewage system, dry storage, repair/maintenance facilities, 150-space RV campground complex with showers and dump stations, 200-room lodging complex, restaurant and cocktail lounge, and a cultural center complex.

The project is opposed by two Navajo grassroots organizations, Diné Medicinemens Association and Diné CARE. The marina is controversial within the Navajo Nation and elsewhere. Antelope Point is billed partly as economic development for the Navajo people, yet it would be owned and operated by a privately-held, white-owned concessionaire based in Phoenix. Alternative economic development strategies have not been considered as part of the environmental planning for the project.

Construction plans call for the first cocktail lounge on the Navajo reservation. A proposal for a nearby casino and shopping center complex is currently under study by the Navajo Nation. No casino has ever operated on the reservation.

* * * TOP TEN ISSUES FOR ANALYSIS * * *

Ask the Park Service to put you on their official mailing list for the Environmental Assessment (EA), and ask them to address as many of these "Top Ten" issues we've identified (below) as you choose. Be sure to add your own ideas if you wish! Your comments are most effective if you put your thoughts in your own words. But feel free to use the information in this message to frame the issues as you see them.

1) Antelope Point Marina is not needed. The analysis must address the purpose and need for the project, and alternatives to the proposal. Expansion of existing development should occur, if needed, before building on undeveloped national parklands. The EA must address the need, if any, for additional development and the many potential alternatives for economic development for the Navajo Nation, while minimizing environmental damage to the greatest extent possible.

2) Alternative economic development options must be considered. Antelope Point may not be the best alternative for bringing jobs to the area and improving quality of life for Navajo people. Detailed economic alternatives analysis should examine anticipated revenues expected to accrue to the Navajo Nation and to individual employees over time under each alternative evaluated. Citizens, including Diné people, have suggested that the Navajo Nation take over operation of existing resort facilities around the reservoir, including Wahweap Marina, which can be expanded to accommodate additional boat slips. This would achieve the goal of promoting economic opportunity while avoiding the environmentally damaging and economically risky option of building and operating a major new resort. The current concessionaire, ARAMARK, is reportedly interested in divesting its concessions at Lake Powell reservoir.

3) Alternative uses for the Antelope Point site must be considered. Rather than operate a high-impact, motorized recreation-oriented resort, NPS should evaluate the possibility of constructing facilities that directly benefit the Navajo people. For example, a health clinic, educational institution, scientific/ecological research laboratories, or traditional healing center (as the Diné Medicinemen's Association has proposed) may be appropriate, compatible uses in this setting. The Navajo Nation currently lacks significant infrastructure for these uses and would clearly benefit from any of these.

4) A new park-wide General Management Plan (GMP) should be prepared before additional development occurs at GCNRA. Antelope Point must not go forward without re-evaluating many of the assumptions built into the park's outdated 1979 GMP, on which plans for the marina project are based. The need and purpose for the project, and many of the assumptions used to justify them, are no longer valid. Over the decades, many recreational activities--and impacts--have changed, e.g. proliferation of jet skis, or personal watercraft (PWC). At the same time, there is growing interest among recreational users for non-motorized recreational opportunities such as sea kayaking or canoeing. No non-motorized recreational zones currently exist on the reservoir. A new GMP should address the need for new recreational opportunities and management practices around the reservoir. The old river channel around Antelope Point would make an ideal motor-free zone, since motorboat users generally travel around the north side of Antelope Island.

5) Recreational safety concerns about the site must be addressed. Antelope Point is located on a narrow bend in the old river channel, a site that is prone to potential user conflicts between powerboat, houseboat and jet ski users. On a typical holiday weekend, hundreds of boats would be moored, floating and in motion in and around the new marina, with water skiers and jet skiers in abundance. The potential for serious visitor safety conflicts and accidents at Antelope Point would be quite high. Regional law

enforcement is already stretched thin covering Wahweap, and a marina at Antelope Point would create additional burdens and responsibilities. The ready availability of alcoholic beverages for sale at the marina would only exacerbate the risk of serious accidents. In 2000, Lake Powell Reservoir was identified by the Wall Street Journal as the nation's second-most dangerous recreational area.

6) Economic risk concerns must be evaluated. No analysis has been published by NPS to demonstrate the long-term economic viability of a second major new marina in the immediate vicinity of Page. In a period of declining visitation to the reservoir, sufficient demand may not exist to justify the investment and commitment of resources to support the Antelope Point project. Since one of the primary goals of the project is to promote economic development for the Navajo Nation, it is essential that specific data be presented to assist the Navajo people in evaluating whether the project would operate in the black over the long term, if it were built. 7) The Antelope Point project should not go forward until the Park Service first resolves its policy on jetskis (PWC), and completes an Environmental Impact Statement (EIS)--currently in preparation--for PWC management at GCNRA. The EIS will examine the possibility of banning PWC and also of limiting them to certain zones of the reservoir. As stated above, the old river channel at Antelope Point would be an ideal motor-free zone, and should be evaluated in the EIS for such use. NPS should not bias its PWC planning process by assuming that Antelope Point Marina will be built.

8) Alternatives must be evaluated for mitigating archeological and cultural resource sites within the project boundary, including ceremonial sites that would be rendered unusable by construction of the project. Consultation with the Diné Medicinemen's Association and other traditional native groups must be conducted.

9) Analysis of the cumulative effects and reasonably foreseeable consequences of the Antelope Point project must be evaluated, including the potential impacts on area businesses, including Wahweap Marina. Increased use of motors on the reservoir and loss of opportunities for non-motorized recreation in the Antelope Point area must be evaluated. The impact of anticipated "companion" projects must also be evaluated (e.g. the Navajo Nation is currently considering a casino and shopping center to be located near the entrance to the resort).

10) Given the likelihood that significant environmental impacts will occur from this project, the law requires that NPS prepare a full Environmental Impact Statement.

Rally for Grand Canyon Restoration

Friday, January 18, 2002 at 11:30 am
Arizona Center II
5th St and Van Buren
Downtown Phoenix

Join LIVING RIVERS and others as we send a message to federal and state agencies, and water and power interests that will be gathering in Phoenix, January 17-18, 2002. This group has been convening for the past five years, charged with developing strategies to heal the Colorado River through Grand Canyon. The ecosystem does not lie, this group is failing. It's critical that the public let them know that the time for action is NOW! Stop Killing the Grand Canyon!

Alfalfa Blues in the Upper Basin

Living Rivers Currents December 2001
[LR Currents V1, N4](#)

Peter Lawson stands next to Professor Creek, which drains into the Colorado River 20 miles upstream of Moab, Utah. For eight months each year he diverts Professor Creek's water for hay cultivation, one of the thousands of marginal alfalfa fields that dominate irrigated agriculture in the upper Colorado watershed. He offered to share his frustrations with how state and federal programs discourage efficient agricultural water use, and make it impossible for farmers to use their water rights to benefit the environment.

When Lawson purchased his farm in 1991, every drop of the Professor Creek's water was poured on to the fields. "I went ahead and installed some fairly sophisticated sprinklers which were much more efficient in delivering water to the alfalfa," he says. "Not only was water being left in the creek, but I was able to increase my acreage under cultivation."

Despite these gains, the state of Utah forced him to buy more water rights because he was farming more land. It made no difference that he was actually using less water than before. "One can't support a family with this business as it is, then when you try to increase efficiency, such that everyone wins, they force you to spend more money."

Lawson points out that he can only get between \$80 and \$100 per ton for his alfalfa. With four cuttings per year, and about one ton per acre from each cutting, that's less than \$40,000 annually from the farm. When deductions are made for land purchase,

equipment and supplies, there's very little left for anything else. This is why many farmers in the upper basin must have another source of income to make ends meet.

"I hate subsidies, but I've applied for them from the US Department of Agriculture on two occasions. It's impossible to keep up with the flood of forms, so I've never received any money," Lawson says. "Whether you have 50 acres, or 50,000, the paperwork is the same, thus it's the large growers with their attorneys that get all the hand outs, making it that much more difficult for the family farms to compete."

Lawson believes that it's vital that all farmers are provided mechanisms so that more water can be left in the rivers for habitat preservation and restoration. "Now there's nothing but disincentives, he says." Any water that he does not use can just be taken by someone else downstream, and were he to stop irrigating altogether, his water rights would be taken away and sold to somebody else.

"Despite this, I'm still trying to figure out how I might be able to use less water," he says. He's considered shifting to orchards with drip irrigation, but the state would require him to reduce the area irrigated, or purchase even more water rights. "These laws are crazy," Lawson concludes. "It would be so easy to for us to heal our rivers, and still feed ourselves, if only the politicians would focus on addressing the problems, not preserving the corporate welfare for the larger growers."

11/26/01

Animas River Rally: Durango Turns out to Stop A-LP

[LR Currents V1, N4](#)

On a warm, sunny day 150 river activists gathered at noon in Durango, Colorado on November 9th alongside the endangered Animas River. Confidently the protestors marched downtown carrying colorful signs and banners while chanting slogans demanding the Animas remain wild and free.

The jubilant crowd, representing 35 groups, then gathered before the offices of the Bureau of Reclamation, calling for termination of the Animas-La Plata Project. Speakers included leaders of social justice, taxpayer and environmental groups from each of the Four Corners states. Citing violations of federal laws, the groups demanded an investigation of the project by the General Accounting Office (GAO).

The urgent nature of the group's complaints were heightened by the imminent excavation of ancient Native American gravesites that would occur in advance of construction. Prior to the rally, members of the Southern Ute and Navajo nations gathered at the proposed reservoir site and offered prayers for the preservation of these sacred grounds.

These concerns were listed in letters addressed to every member of Congress and deposited in the mailbox before the BuRec office. "We want accountability, not more

corporate subsidies," exclaimed Owen Lammers, executive director of LIVING RIVERS. "The real estate developers want to declare victory in this struggle, but we're here to tell them they're going to lose." The rally also signified the first public event in LIVING RIVERS' campaign to reform of the Bureau of Reclamation in its centennial year, 2002.

The march continued back to the shores of the Animas River where refreshments were presented and local musicians entertained till sunset.

11/26/01

Going, Going, Gone? Grand Canyon Native Fish

[LR Currents V1, N4](#)

New data from ongoing research in Grand Canyon National Park suggest a serious decline in humpback chub numbers in the Colorado River through Grand Canyon. This is one of the last wild populations of humpback in the world. The canyon's three other endangered species, Colorado pikeminnow, bonytail, and razorback sucker have long been extinct in the canyon.

Endangered fish throughout the Colorado River now have even more to fear. A new recovery plan issued in September by the U.S. Fish and Wildlife Service (USFWS) would make survival of these fish species largely dependent upon hatcheries, while river habitat restoration needs go unaddressed.

Fish recovery would not be based on viable wild populations that can reproduce in native habitat, but on hatchery fish being continuously dumped to maintain a given population size. "This is completely artificial," says John Weisheit, LIVING RIVERS Conservation Director. "If the river can't sustain the fish on its own, then there is no recovery."

Bowing to pressure from water and power interests, the USFWS continues to ignore the major problems driving these unique fishes to extinction: (1) dams that block migration paths and degrade habitat conditions; (2) water waste by irrigators and other users, dangerously depleting streamflows; and (3) introduced fish species that prey on and compete with natives. Final recovery goals are expected in early 2002. LIVING RIVERS and others have submitted comments, calling for a basinwide recovery plan that emphasizes dam decommissioning, habitat restoration, water conservation, and non-native fish removal. You can too! Write Dr. Robert Muth, Director, Upper Colorado River Endangered Fish Recovery Program, U.S. Fish & Wildlife Service, P.O. Box 25486, Denver, CO 80225; robert_muth@fws.gov.

11/26/01

Hay Burn: Alfalfa Subsidies and Public Health

[LR Currents V1, N4](#), December 2001

By Gordon LaBedz, M.D.

More people die of heart disease and strokes than all other illnesses combined. The cause? The red-meat-oriented American diet, high in fat, with beef and dairy as the prime culprit. And you and I pay for it through government subsidies.

While many ranchers get their share of corporate welfare, the less-visible cattle feed industry is also cashing in: Corn is the main crop for fattening cattle in the Midwest, but here in the West, it's alfalfa.

Taxpayers unwittingly fund a system that perpetuates unhealthy diets for millions of Americans, bringing on early death or illness for tens of thousands every year.

A recent US Public Health Service report concluded that 1.29 million, or 54% of all U.S. deaths can be attributed to the substantial risk factors associated with the consumption of meat products. The Economic Research Center reports \$80 billion dollars in annual medical costs and lost productivity from over-consumption of fatty foods. Cows are killing us!

According to government and independent figures, we could save on average 75% of the water used to irrigate alfalfa by planting vegetables. If we subsidize crops, why not at least grow nutritious food? We could save money and river ecosystems, but most importantly, we would help people live healthier and longer lives.

As a physician I see more than my share of patients who are being killed by the beef? and alfalfa? industries. As a taxpayer I am outraged that my dollars are being used to keep these destructive industries in business.

Gordon LaBedz, M.D., is a physician in the Greater Los Angeles area and is Chair of the Sierra Club Angeles Chapter.

Industrial Hay: Draining the Lower Colorado

[LR Currents V1, N4](#), December 2001

by Christine Henges-Jeck

Each year, almost half the Colorado's annual flow, some six million acre feet, arrive at Imperial Dam just 150 miles from the river's mouth in the Gulf of California. In non-flood years, the water diverted from Imperial onward irrigates 1.2 million acres in southwestern Arizona, southeastern California, and the Mexican states of Baja

California and Sonora. Despite increasing demand for water throughout the Colorado River low-value, water-intensive crops, especially alfalfa, consume a disproportionate amount of the region's water. Alfalfa is the region's most water intensive crop, second largest crop by area, and of extremely low value.

The region's farmers irrigate over 230,000 acres of alfalfa annually. Nearly three-quarters of the crop grows in California's Imperial Valley. The remaining twenty-five percent of the region's alfalfa crop grows across the border in the Mexicali Valley and, to a lesser extent, in Arizona's Yuma area. Farmers grow alfalfa because it requires less labor than other crops, can be harvested multiple times during the region's long growing season, and tolerates the poorly drained clay soils of the Imperial and Mexicali valleys.

Alfalfa consumes more water than any other crop below Imperial Dam. Farmers apply as much as seven vertical feet of water to alfalfa crops, to promote growth under the hot desert sun. Although it comprises less than twenty percent of the region's irrigated acreage, alfalfa uses over forty percent of the water used by the region's crops. Per acre, alfalfa consumes sixty percent more water than wheat, the region's largest crop, forty percent more water than cotton, the third largest crop by acreage, and seventy-five percent more water than lettuce, the fourth largest crop. The region's alfalfa crop uses more water than all these crops combined.

Although alfalfa consumes an enormous quantity of water, its value per acre is relatively low. According to Imperial County, the Imperial Valley's alfalfa crop value was \$687 per acre in 1999. This stands in stark comparison to lettuces which generated \$3,895 to \$5,021 per acre. Even cotton, another low value crop generated higher values at \$959 per acre in the same year.

Alfalfa is a feed crop, especially for dairy operations in the Imperial Valley and California's Central Valley, among other locations. The plentiful, senior water rights enjoyed by farmers in the region permit the cultivation of this water-intensive crop. If price signals were different, it is quite likely that farmers would maximize their returns by turning to other, higher-value crops. Until such changes occur, millions of acre-feet will be diverted from the Colorado River to support these low-value feed crops.

Christine Henges-Jeck is a Research Associate with Pacific Institute. For more information on water use in the Lower Colorado region, see the Pacific Institute's new report, *Missing Water: The Uses and Flows of Water in the Colorado River Delta Region*, available on-line at www.pacinst.org.

11/26/01

Trading Alfalfa for Delta Restoration

[LR Currents V1, N4](#)

Scientists estimate that the currently desiccated Colorado River delta could begin regeneration with just one percent of the river's flow. To reach the one percent conservation goal for the Colorado River alfalfa growers could:

- Shift 43,000 acres of alfalfa from sprinkler to drip irrigation.
- Shift 38,500 acres of alfalfa to higher value, less water-intensive citrus and vegetable crops; or
- Fallow 17,200 acres of alfalfa

As Mark Lewis said in his Veteran's Day column in the Farmington Daily Times, regarding the One Percent Campaign, "Are we willing to sacrifice a little so something for the overall good is accomplished? We would be giving something of ourselves for the betterment of everyone. I wonder if we are up to it."

Animas River worse off since "Most Endangered" listing 6 months ago

Six months after listing as one of nation's Most Endangered Rivers, water diversion project still pending threat

Six months after American Rivers listed the Animas as one the nation's most endangered rivers, American Rivers and its partners find that the construction of a water diversion project that would threaten Native American cultural sites, local wildlife, trout fisheries and natural lands is more likely than ever.

The Animas-La Plata (ALP) project, which would divert approximately one quarter of the river's flow, will have a severe negative impact on endangered fish species, a thriving recreational rafting industry, riparian wetlands, and a gold medal trout fishery. However,

the U.S. Senate and U.S. House of Representatives both passed appropriations bills for FY 2002 that allocate \$16 million to construct ALP. At the time of this update, President Bush had not signed the legislation.

In November, a coalition of Native American, social justice, taxpayer, and environmental groups joined by American Rivers, launched a national campaign to de-authorize ALP. The coalition, which sent a letter to Congress seeking a halt to construction funding, also called for an investigation by the General Accounting Office (GAO) into numerous improprieties in the project that have been identified by citizens groups.

A significant amount of funding required to complete the project has not yet been appropriated, and efforts to block financial support for ALP will continue in an effort to prevent this half-billion dollar environmentally destructive government boondoggle from moving forward.

In April 2001, American Rivers released its annual Most Endangered Rivers report, documenting rivers of regional or national significance at the greatest risk of suffering damage in the coming 12 months. Six months later, American Rivers finds at least some positive progress on eight of the 13 rivers listed. In the report, American Rivers also identified the nation's inefficient and outmoded means for producing and consuming energy as a leading threat to rivers nationwide. Six months later, American Rivers finds that there has been no progress towards a 21st energy policy that balances supply and demand through energy conservation and efficiency, and increased reliance on renewable technologies such as wind and solar.

President Bush has released his national energy policy, a companion energy bill has passed the House of Representatives, several pieces of legislation are under consideration in the Senate, and the terrorist attacks of Sept. 11 have significantly increased pressure to expand production of fossil fuels.

For more information on the 2001 Most Endangered Rivers report, visit

www.AmericanRivers.org/MostEndangered2001. For more information on American Rivers, visit www.AmericanRivers.org.

11/18/01

Resolution of the Desert Fishes Council

Resolution adopted by Desert Fishes Council at its 15-18 November 2001 meeting. Relative to Draft Recovery Goals for the bonytail, humpback chub, Colorado pikeminnow, and razorback sucker of the Colorado River basin

WHEREAS, the draft recovery goals for the four fishes, developed by the U.S. Fish and Wildlife Service, will be integral to the future status of these fish species and the ecosystems upon which they depend; and

WHEREAS, much biological information has been presented during the development of these goals that indicates that disagreement exists regarding the appropriate approaches and methodologies to be used to develop the demographic and genetic bases for such recovery goals;

THEREFORE, BE IT RESOLVED that the Desert Fishes Council, an international society composed of professionals from academic, government, and private organizations and private individuals, at its 2001 annual meeting held in Alpine, Texas, 15 – 18 November, is opposed to the adoption of the draft recovery goals for the bonytail, humpback chub, Colorado pikeminnow, and razorback sucker of the Colorado River basin as currently written; and

BE IT FURTHER RESOLVED that the Desert Fishes Council recommends that the U.S. Fish and Wildlife Service redraft the recovery goals based upon the results of a rigorous, independent, scientific review and review of all comments received by the Service by the National Research Council or an equivalent independent scientific body; and

BE IT FURTHER RESOLVED that copies of this resolution be sent to the Director of the U.S. Fish and Wildlife Service, the Regional Director of Region 6 of the U.S. Fish and Wildlife Service, the Regional Director of Region 2 of the U.S. Fish and Wildlife Service, and the Director of the Upper Colorado River Endangered Fish Recovery Program prior to the comment deadline.

Are Americans up to a little sacrifice?

Farmington Daily Times
Mark Lewis/Editorial Page Editor

I was in Durango Friday reporting on a group of people protesting the Animas-La Plata Project.

It was an interesting group of people. Young, old, middle-aged, etc. In some ways it took me back to my youth, when many young people took to the streets protesting for civil rights or against the Vietnam War.

This group was different, however.

While I don't doubt the sincerity of their beliefs, they just didn't have the same energy that I remember of bygone protests. I did, however, find many people willing to talk about Animas-La Plata, something of a rarity these days.

Among them was Evert Oldham, a man I've known for some time. If I had to use one word to describe Evert, it would be thoughtful. He has always struck me as a guy who thinks about what he is going to say and the meaning of the words he intends to use.

He also is not shy about sharing his knowledge with people, sometimes going into minute detail. So, when he described some of the other folks at the protest and of how their focus had changed, it struck my interest.

Living Rivers, the organization that sponsored Friday's protest, initially concentrated on efforts to drain Lake Powell. Whether those in the group have realized that such a narrow focus wasn't going to gain popular support, especially regarding Lake Powell, or whether some other reason arose, they have expanded their focus to the entire Colorado River Basin.

One of their main interests at this time is to find a way to restore the Colorado River delta, which is drying up because of overuse of water, endangering some species of wildlife in the process.

I was even more intrigued

I studied enough biology in college to at least understand that no species can exist if isolated in an ecosystem.

In other words, trying to save one breed of plant or animal, like the Colorado pikeminnow for example, is foolish unless the entire ecosystem is either preserved or at least restored enough to maintain the plants and animals that the pikeminnow depends on for food, shelter, etc.

That's why when people say they want to prevent Animas-La Plata, I usually give them the single-raised-eyebrow look and shake my head because it is just one small piece in a very large puzzle.

But here was a group willing to tackle the entire Colorado River Basin.

One idea they have come up with is for all water users in all areas of the Colorado River Basin, which would include us along the Animas and San Juan Rivers, to give up 1 percent of the water allocated to them to preserve and restore the river delta and thereby preserve the life that depends on it.

It sounds like a good idea, but there is a problem. Nobody will do it if everybody - and I mean everybody - doesn't go along with it.

After all, why should the people in the Upper Colorado River Basin give up water just so someone downstream, who hasn't agreed to the idea, can grab it to water a new golf course in Palm Springs?

Evert also mentioned that water is a states rights issue, which causes another problem.

If the water isn't used here, it is quite possible someone elsewhere in the state would lay claim to it.

A good example would be Albuquerque. It could get water from San Juan County via the San Juan-Chama diversion tunnel. For those unfamiliar with it, it is a tunnel that takes

water from the head of Navajo Reservoir and sends it under the continental divide into the Chama River, which flows into the Rio Grande.

If people here were of a giving nature and did dedicate 1 percent of their water to the Colorado River Delta, the water probably would never see the state line. Albuquerque or some other interest down south would snap it up in a moment.

Such a plan also involves something Americans have not had to do much of during the past decade or two - sacrifice.

Giving up 1 percent of their allocated water might mean one less golf course or football field. It might mean people would have to stop planting Kentucky blue grass.

Are we willing to sacrifice a little so something for the overall good is accomplished?

We have in the past.

Today is a day to remember just such sacrifices - those made by veterans in the numerous wars and conflicts in which America has fought. I realize there really is no comparison between the sacrifices of veterans and doing without a few luxuries like golf courses, but the idea is the same.

We would be giving something of ourselves for the betterment of everyone.

I wonder if we are up to it?

Mark Lewis can be reached by calling (505) 564-4626, by e-mail at markl@daily-times.com or by writing to P.O. Box 450, Farmington, NM 87499.

A-LP opponents protest

Durango Herald Page A-1

PHOTO: Opponents of the Animas-La Plata Project march up East Second Avenue on Friday.

By Melanie Brubaker Mazur Durango Herald Staff Writer

Chanting "no more dams," more than 100 people marched through Durango Friday to protest the official start of construction of the Animas-La Plata Project.

Marchers waved signs as they moved from Rotary Park to the U.S. Bureau of Reclamation's Durango office at 835 E. Second Ave. and mailed more than 500 letters to the U.S. Congress and bureau headquarters. The letters protested the cost and environmental effects of A-LP and requested an investigation by the General Accounting Office into the project's funding.

The protest was sponsored by Living Rivers, an environmental group in Moab, Utah, with the support of 35 other businesses and environmental groups.

While Friday marked the government's official start of construction on A-LP, any actual earthwork in Ridges Basin, where a reservoir is supposed to be built to hold water from the Animas River, won't take place for at least a year. Design work on the pumping plant and reservoir, an archaeological study and relocation of two natural gas lines will begin with a \$16 million appropriation passed by a congressional conference committee on Oct. 17. In all, the project is expected to cost \$343.8 million.

Protesters carried signs stating "Dam the Bureau," "Revive the Colorado – an ecosystem, not a plumbing system," and "Bruce's Bathtub." The latter referred to former Interior Secretary Bruce Babbitt's support for the project. Babbitt and other supporters said the project will fulfill water treaties signed with the Southern Ute Indian Tribe.

American Indians signed treaties with the U.S. government under duress when few of them were educated about the effects of such treaties, said Thomas Morris Jr., president of the Diné Medicine Men's Association. He told the crowd at the bureau office that Navajo Indians don't live by written laws. David Orr, director of field programs for Living Rivers, a Moab, Utah, environmental group, and Owen Lammers, executive director, mail letters to Congress in front of the U.S. Bureau of Reclamation office.

"We live by nature law," he said. "It's an open law, an unwritten law."

At a post-march gathering in Schneider Park, JoEtta Goldtooth, of Tuba City, Ariz., echoed Morris' comment. Goldtooth is a member of the Diné Sovereignty Defense Association, which is trying to secure Navajo water rights in the Colorado River.

"We are a very poor nation," Goldtooth told the crowd. "If we had the rights to our water, we would be a very rich nation. Water is gold – it is life."

If water is the blood of the Earth, Goldtooth said dams are blood clots.

"That's how I look at it," she said.

Catherine Olson, of Cedar Hill, N.M., brought her four children and carried a sign reading "Consider the children of tomorrow."

"We're just lovers of flowing water," she said.

Nancy Jacques, a Durangoan and a longtime opponent of A-LP, joined the group soaking up sunshine and listening to speakers.

"A-LP truly is a dinosaur of another generation," she said. "It's time for it to die and focus on other alternatives."

The bureau should re-examine the entire Colorado rivershed and how the water is divided among different users, she said.

David Orr of Living Rivers told the protesters their actions cannot end with the rally. They need to write their representatives and inform their neighbors about the detrimental effects of the project, he said.

11/10/01

Marchers call for A-LP project to stop

A-LP Protest: Marchers call for A-LP project to stop
by Mark Lewis, Staff writer The Daily Times, page A-1, column 1 Farmington, New Mexico

DURANGO, Colo. -- Chanting "no more dams" and other slogans, about 150 people marched through downtown Durango on Friday protesting Congress' allocation of money for the Animas-La Plata Project.

David Orr, with Living Rivers, said he believes that when the facts about Animas-La Plata become known, it will be recognized as the least justifiable water project ever to come before Congress.

Animas-La Plata is a water storage project first authorized in 1968 by Congress and reauthorized in a scaled-down form in 2000. That bill was signed into law by President Bill Clinton.

The project would entail construction of a reservoir at Ridges Basin, a few miles south of Durango, and pumps on the Animas River to pump water into the reservoir. The project also involves settlement of water rights claims made by the Southern Ute and the Ute Mountain Ute tribes. Another smaller project added to the overall Animas-La Plata is a water line taking potable water from Farmington to Shiprock.

Living Rivers sponsored the march and rally in association with a number of other organizations, including the Taxpayers for the Animas River, San Juan Citizens Alliance, Four Corners River Sports, Southern Ute Grassroots Organization and the Sierra Club.

The march included people carrying picket signs, and in some cases, replicas of the endangered Colorado pikeminnow. Some marchers brought their children. while others distributed leaflets to passing motorists.

During the rally, Orr and others poured hundreds of copies of a letter detailing concerns about Animas-La Plata into mailboxes outside the Bureau of Reclamation offices in Durango. He also read the letter aloud to those gathered.

Among the allegations made in the letter were that non-structural alternatives were not given proper consideration, that the Colorado Ute Tribes don't have a legitimate claim to the water and that no needs for the stored water have been identified.

Christine Arbogast, with Kogovsek and Associates, a law firm representing project supporters, issued a statement Friday contesting the allegations made in the letter.

Arbogast counters that A-LP is a tribal water rights settlement with two-thirds of project water allocated to either the Colorado Ute tribes or the Navajo Nation.

During the rally before the Bureau of Reclamation offices, Orr and other speakers repeatedly called the project to be stopped.

"Just because its been approved doesn't mean it's been built. If need be, we can occupy," he said, referring to occupying the area at Ridges Basin where the reservoir is to be constructed.

Arbogast argues that dismissing the project would force the Ute tribes to proceed with litigation to secure their water rights.

Orr also cited alleged corruption and misdeeds associated with the project.

The statement released by Kogovsek and Associates dismisses those statements as false, citing the appearance of opponents who testified during Congressional hearings and the Environmental Impact Statement, which is several thousand pages long and took two years and multiple public hearings throughout the Four Corners to complete.

Another section of the letter which Orr read to the crowd claimed that significant Native American sites would be damaged by the reservoir, including a burial ground, and that opponents of the project should protect the interests of the tribes.

Arbogast said opponents ignored the will of tribal councils, which support Animas-la Plata, and are duly elected by the Native American people and represent their interests. The bureau also is working with the tribes to ensure that, should any be found, cultural artifacts or burials are protected, she said.

Thomas Morris, a Navajo medicine man representing the Diné Medicine Men Association in Window Rock, Ariz., said he opposed the project because it was yet another unfulfilled promise made to Native Americans. Rather than changing nature, people should learn to live with it, he said.

"We don't control nature, nature controls us," he said.

A-LP opponents to demonstrate today

By Melanie Brubaker Mazur Durango Herald Staff Writer

"The chances are pretty overwhelming the construction will go ahead, and it will get built. The environmental studies have been done, then done, then redone. I don't think a court will stop the project." - Mike Griswold, president of the A-LP Water Conservancy District

Opponents of the Animas-La Plata Project aren't giving up their fight, and they plan a demonstration at noon today.

Living Rivers, a Utah environmental group, is organizing the demonstration to protest the planned construction of the \$343 million project.

"They are draining more and more from a river that has nothing else to give," said John Weisheit, president of Living Rivers, formerly the Glen Canyon Action Network.

The group, located in Moab, is expanding its focus from deconstructing Glen Canyon Dam and draining Lake Powell to protecting all of the Colorado River watershed, Weisheit said. The Animas flows into the San Juan River, which empties into the Colorado River.

Mike Griswold, president of the Animas-La Plata Water Conservancy District, said he doesn't think protests at this point will stop A-LP.

"The chances are pretty overwhelming the construction will go ahead, and it will get built," Griswold said. "The environmental studies have been done, then done, then redone. I don't think a court will stop the project."

People opposing the project haven't kept in mind that A-LP has been scaled back 40 percent, Griswold said.

The project will use 14 percent of the Animas River's annual flow, mostly during the heavy spring runoffs.

"A lay person won't see a difference in the river levels," he said. "They won't notice it."

More than 35 groups and businesses support the protest, including the Diné Medicine Men's Association, the Sierra Club, the Southern Ute Grassroots Organization and the Wilderness Society.

The rally begins at noon at Rotary Park. Participants will then march to the U.S. Bureau of Reclamation Office at 835 East Second Ave., where protesters will present a letter to the agency and mail letters to Congress. The procession will continue south on Ninth Street to Schneider Park, north of the Ninth Street bridge, where it will culminate with speeches, refreshments and music.

Some members of the Navajo Nation say the project will destroy an ancient burial ground in the reservoir site.

"We must protect the resting places of our ancestors," said Thomas Morris, Jr., president of the Diné Medicine Men's Association and a resident of Window Rock, Ariz., in a news release. "Too many of our sacred places have already been drowned, we can't let them keep taking more."

Congress has approved the project and \$17 million in initial funding.

Citizens Rally in Durango to Save the Animas River

Grassroots organizations march on Bureau of Reclamation in Durango, demand halt to controversial Animas-La Plata water project

DURANGO, Colorado, Nov. 9 -- On the day that government officials had set to mark the beginning of the latest incarnation of the controversial Animas-La Plata (A-LP) water project, a crowd of 150 people, including representatives of more than 35 native and non-native organizations from across the United States rallied on the sidewalk in front of the U.S. Bureau of Reclamation here today, calling for the project's cancellation.

Chanting "No more dams!" and "Investigation, not excavation," the upbeat crowd marched through Durango's business district with colorful signs and banners on an unusually warm and sunny November day. Citing a number of improprieties and violations of federal laws and regulations, the groups demanded an investigation of the project by the General Accounting Office (GAO). The urgent nature of the group's complaints were heightened by the imminent excavation of ancient Native American gravesites that would occur in advance of construction.

"We want accountability, not more corporate subsidies," exclaimed Owen Lammers, executive director of LIVING RIVERS. "The real estate developers want to declare victory in this struggle, but we're here to tell them they're going to lose."

The noon-hour procession to the Bureau of Reclamation office began at Rotary Park and made its way along Durango's busy Main Avenue, eliciting enthusiastic expressions of support from shopkeepers, pedestrians and motorists. Among the speakers addressing the crowd were leaders of Native American, social justice, taxpayer and environmental groups from each of the Four Corners states.

Earlier in the day, members of the Southern Ute and Navajo nations gathered for a ceremonial blessing and pipe ceremony at the site of the proposed dam and reservoir, the principal structural components of the A-LP project.

Thomas Morris, Jr., president of Diné Medicinemen's Association from Window Rock, Arizona, and Sage Douglas Remington of the Southern Ute Grassroots Organization, based in Ignacio, Colorado, were among the speakers who urged the A-LP project be cancelled due to its destructive impact on traditional cultural and archeological sites.

A highlight of the event was the mailing of a letter to each member of the U.S. Congress, asking for the GAO investigation, a halt to future funding, and the ultimate de-authorization of the project. Letters were deposited in the U.S. mailbox on the sidewalk outside the Bureau's office building. [A text version of the letter is included below.]

The march continued to Schneider Park alongside the Animas River, where local musicians entertained the participants until late in the day.

The rally also signified the first public event in LIVING RIVERS' campaign for overall reform of the Bureau of Reclamation in its centennial year, 2002.

"We are asking the Bureau to shift away from reclamation toward restoration," said Mr. Lammers.

Additional information about LIVING RIVERS' "Reclaim the Bureau" campaign may be found on the organization's website:

<http://www.livingrivers2.org>

LIST OF SPONSORING GROUPS AND BUSINESSES FOR TODAY'S RALLY:

The following organizations and businesses have endorsed today's event and campaign:

Aimee's Catering, American Rivers, American Whitewater, Audubon Society of Greater Denver, Diné Medicinemens Association, Citizens Coal Council, Citizens Progressive Alliance, Colorado Environmental Coalition, Colorado Plateau River Guides, Colorado Rivers Alliance, Colorado Whitewater, Electors Concerned About Animas Water, Escalante Wilderness Project, Flagstaff Activist Network, Forest Conservation Council, Forest Guardians, Four Corners Riversports, Friends of Arizona Rivers, Friends of the Earth, Glen Canyon Institute, Great Old Broads for Wilderness, Green Party of Utah, High Country Citizens Alliance, Living Rivers, Native Forest Network, Oil & Gas Accountability Project, Old House Bakery, Remarkable Earth Photography, Ridgeline & Open Space Coalition, San Juan Audubon, San Juan Citizens Alliance, Shared Blanket Gallery, Sierra Club, Southern Ute Grassroots Organization, Taxpayers for the Animas River, Tribal Environmental Watch Alliance, Utah Environmental Congress, Utah Rivers Council, Water Information Network and Wilderness Society.

LETTER TO CONGRESS

November 9, 2001

Dear Member of Congress:

We, the representatives of 25 organizations from the Four Corners states of Colorado, Arizona, New Mexico, and Utah, Indian Nations, and other groups around the United States are writing to express our profound disappointment over the recently approved appropriation for the controversial Animas-La Plata (A-LP) water project.

We believe that once certain facts about this project are known, A-LP will be exposed as the least justified water project ever proposed to Congress. We ask your help to stop imminent harm to Native American cultural and archeological resources while an investigation of our concerns by the General Accounting Office (GAO) can be completed. In the meantime, we ask you to halt future funding for the project and to support legislation to de-authorize A-LP, once and for all.

Funding for "pre-construction" activities for this half-billion dollar project in southwestern Colorado and northwestern New Mexico was just approved in the Fiscal Year 2002 Energy and Water Appropriations bill. However, local citizens are united more than ever in our commitment and resolve to convince the Congress to de-authorize the costly, unpopular A-LP. It was authorized last year in the form of a rider, passed late in the night without benefit of sufficient debate. The collective voices of affected citizens were not heard. We call on you now for help in defending our land, water and cultural heritage.

A full and open review of the facts will confirm a well-established pattern of misrepresentations by project proponents. A GAO investigation is needed to evaluate the irregularities and improprieties identified by citizen groups over the years.

- * The American people have not been told what specific benefits this project would provide. No need for A-LP project water has been identified, and non-structural alternatives to the project were not given adequate consideration.

- * A-LP violates federal regulations that govern the planning of federally financed water projects. Project planners have steadfastly ignored these "principles and guidelines" of the President's Water Resources Council, which require rigorous economic and environmental analysis to protect the public against wasteful, special interest spending on projects like A-LP.

- * The Department of Interior and other federal agencies have refused numerous requests for documents germane to the project. In addition, three objections have been filed against the project's water rights. These agencies are currently defendants in citizen suits under the Freedom of Information Act, seeking to force the release of this information to the public.

- * A-LP has been promoted as a water rights settlement for the Colorado Ute Indian nations, but it does not satisfy community water needs. Southern Ute tribal members' proposal for a non-structural alternative to the A-LP project was dismissed.

- * An additional component of the project is a water pipeline to serve future industrial development on and off the Navajo Nation. Members of the Navajo Nation have expressed concerns that diversion of A-LP project water to non-Navajo users infringes upon their nation's reserved water rights.

We appreciate Congress' desire to assist Native Americans. However, A-LP is the wrong response to the question of resolving Indian water rights claims. Fiscally and environmentally sound options for serving community water needs on and off the

reservations were not considered. A-LP is a subsidy to industrial and real estate development, masquerading as a project to benefit Native Americans.

We need your help to prevent the misuse of federal funds, desecration of sacred sites, destruction of fish and wildlife, and further pollution of air and water. Overwhelming, compelling evidence exists to suggest that the public has been systematically deceived about the purposes and benefits of A-LP.

At a time when Congress is increasingly concerned with fiscal responsibility in the face of dramatically shifting budget priorities, it is even more crucial to take a closer look at A-LP. Spending huge sums of public money on a problem-ridden project where no rational analysis has been done is simply not prudent. Neither is it an appropriate means of addressing Indian water rights questions.

Irretrievable actions are imminent. Authorized pre-construction activities include the excavation of an extensive, centuries-old Native American cemetery, sacred to many in our region. Traditional native leaders are voicing strong objections to disturbing their ancestors' remains. Please help us find a way to prevent this, pending the outcome of the requested GAO investigation.

We invite you to come visit us, and take a tour of the affected area. Let us explain to you firsthand our concerns and the issues we face; let us show you why A-LP is the problem, not the answer. We would be happy to discuss this matter further with you or your staff. Please feel free to contact one or all of the groups listed below for additional information.

Coalition Asks Congress to De-Authorize AL-P

November 9, 2001

Dear Member of Congress:

We, the representatives of 25 organizations from the Four Corners states of Colorado, Arizona, New Mexico, and Utah, Indian Nations, and other groups around the United States are writing to express our profound disappointment over the recently approved appropriation for the controversial Animas-La Plata (A-LP) water project.

We believe that once certain facts about this project are known, A-LP will be exposed as the least justified water project ever proposed to Congress. We ask your help to stop imminent harm to Native American cultural and archeological resources while an investigation of our concerns by the General Accounting Office (GAO) can be completed. In the meantime, we ask you to halt future funding for the project and to support legislation to de-authorize A-LP, once and for all.

Funding for "pre-construction" activities for this half-billion dollar project in southwestern Colorado and northwestern New Mexico was just approved in the Fiscal Year 2002

Energy and Water Appropriations bill. However, local citizens are united more than ever in our commitment and resolve to convince the Congress to de-authorize the costly, unpopular A-LP.

It was authorized last year in the form of a rider, passed late in the night without benefit of sufficient debate. The collective voices of affected citizens were not heard. We call on you now for help in defending our land, water and cultural heritage.

A full and open review of the facts will confirm a well-established pattern of misrepresentations by project proponents. A GAO investigation is needed to evaluate the irregularities and improprieties identified by citizen groups over the years.

- The American people have not been told what specific benefits this project would provide. No need for A-LP project water has been identified, and non-structural alternatives to the project were not given adequate consideration.
- A-LP violates federal regulations that govern the planning of federally financed water projects. Project planners have steadfastly ignored these "principles and guidelines" of the President's Water Resources Council, which require rigorous economic and environmental analysis to protect the public against wasteful, special interest spending on projects like A-LP.
- The Department of Interior and other federal agencies have refused numerous requests for documents germane to the project. In addition, three objections have been filed against the project's water rights. These agencies are currently defendants in citizen suits under the Freedom of Information Act, seeking to force the release of this information to the public.
- A-LP has been promoted as a water rights settlement for the Colorado Ute Indian nations, but it does not satisfy community water needs. Southern Ute tribal members' proposal for a non-structural alternative to the A-LP project was dismissed.
- An additional component of the project is a water pipeline to serve future industrial development on and off the Navajo Nation. Members of the Navajo Nation have expressed concerns that diversion of A-LP project water to non-Navajo users infringes upon their nation's reserved water rights.

We appreciate Congress' desire to assist Native Americans. However, A-LP is the wrong response to the question of resolving Indian water rights claims. Fiscally and environmentally sound options for serving community water needs on and off the reservations were not considered. A-LP is a subsidy to industrial and real estate development, masquerading as a project to benefit Native Americans.

We need your help to prevent the misuse of federal funds, desecration of sacred sites, destruction of fish and wildlife, and further pollution of air and water. Medicine man prays at A-LP site

By Brian Newsome Durango Herald Staff Writer

Thomas Morris Jr. said he did not brave lightning and pelting rain Thursday to pray for the fall of the Animas La Plata Project – he prayed to the ancestral spirits A-LP would likely displace.

The Navajo medicine man, standing atop a hill that will be underwater if the project is completed, called out to the spirits of people who may be buried at the site of the future dam and reservoir southwest of Durango. He asked for the spirits' forgiveness and protection should their remains be relocated or submerged.

The A-LP project will divert water from the Animas River to the reservoir to provide water for the Ute Indians promised in a 19th-century U.S. treaty.

American Indian remains probably will be uncovered during the construction, according to Pat Schumacher, Durango manager for the U.S. Bureau of Reclamation, which will build A-LP.

"It'd be real rare if we didn't run into some burials, because it's real common throughout Southwest Colorado," Schumacher said. Some sites could remain underwater, but others would have to be excavated, he said.

For Morris, president of the Diné Medicine Men's Association, this means more than removing bones and artifacts. It means disrespecting the dead and angering the spirits.

"This is the valley, here, where our ancestors have been laid to rest," he said.

Kenny Frost, a Southern Ute Tribal Member who works as a consultant dealing with burial sites and ancestry, said, "Our (the American Indian) belief is you're not supposed to disturb those who have passed on." He said traditionally there is a purification process for those who disturb the dead.

Morris chanted prayers in his native tongue and performed sacred rites amid five other AL-P opponents at the ceremony. Frost concluded the ceremony by singing a song to the spirits.

The group planned a second ceremony for sunset today to celebrate life and beauty at the same place, near a small parking area along County Road 211.

American Indian remains may not be the only discovery once the project begins. Oral history indicates a non-Indian family cemetery might exist somewhere within the site, Schumacher said.

If Indian remains are discovered, Schumacher said they would likely be ancestral Puebloan remains and would not be found in a burial ground comparable to modern-day cemeteries. He said the ancestral Puebloans buried their dead near kivas, large rooms used for religious and other purposes.

But how the ancestors were buried is not the issue for Morris.

"From the Western (point of view) there's no respect for native people, for their burial," he said.

Non-Indians give respect to their own dead at funerals, he said, but do not offer that same respect to other cultures. "We, native people, respect nature and leave it alone," he said.

11/09/01

Official beginning declared for A-LP

By Bob Schober Durango Herald Staff Writer With digging probably a year or more away, today marks the second time in nine years that federal officials will attempt to officially start construction of the Animas-La Plata water project.

The chief of the U.S. Bureau of Reclamation named today as the official start of construction as well as the deadline for the four nontribal partners of the project to prepay their share of construction costs without incurring interest.

The designation allows the bureau to begin physical projects, although actual earth moving is at least a year away, officials said.

The first official start date, 1992, was derailed by a lawsuit filed on behalf of a coalition of environmental groups. That resulted in an injunction against "irreversible construction," nine years of project revision, new environmental impact studies and funding cutbacks.

Now, project supporters are hopeful opponents will finally stay out of court.

"There's been a huge amount of compromise forged over the years," said Sam Maynes, the Durango lawyer representing the Southern Ute and Ute Mountain Ute tribes. "The main thing is, this is the best way to settle the tribes' water claims."

Don't be so sure, said Lori Potter, a Denver lawyer who filed the 1992 lawsuit on behalf of the Sierra Club Legal Defense Fund, Taxpayers for the Animas River and the Four Corners Action Coalition, among others. The groups are mulling over another possible lawsuit, but no decision has been made, Potter said. "It's a definite possibility," she said.

Maynes said he isn't surprised.

"I anticipate that at some point in time the national environmental groups will file a suit," he said. "They have nothing to lose. Delay is their game."

Nonsense, said Michael Black, spokesman for the Taxpayers for the Animas River.

"The reason they haven't built it is because it's a stupid project, and people realize that," Black said.

At least one group opposing the project has challenged the Department of Interior for not complying with the federal Freedom of Information Act.

Citizens' Progressive Alliance, a watchdog group based in Colorado and northwest New Mexico that opposes A-LP, filed a lawsuit Sept. 10 against the Interior Department for not providing a report evaluating the Ute tribes' water rights.

"We think the documents we are likely to get will expose so many violations of law and federal policy that it would be sufficient evidence to call for a grand jury investigation,"

said group spokeswoman Jeanne Englert. "We'll get the documents, and we'll see if that requires further action. We're still in the process of exposing their lies."

Nevertheless, today's date remains important for two reasons. As the date of the official start of construction, the Bureau of Reclamation can begin "irreversible construction," which would make stopping the project much more difficult.

"It's a huge step forward," Maynes said. "If the environmental groups are going to file, they'll have to do so before any irreversible construction."

And Congress recently approved \$16 million, plus an additional \$1 million from the fiscal 2001 federal budget, for the project.

"This will be enough to give us a good start," said Pat Schumacher, Bureau of Reclamation manager for Durango.

The San Juan Water Commission decided Sept. 2 to prepay its \$6.9 million share, saving an estimated \$2.6 million in interest.

The Colorado Water Resources and Power Development Authority, which is paying the \$7.3 million share of the A-LP Water Conservancy District, will save about \$2.5 million in interest, said Mike Griswold, president of the A-LP Conservancy District.

Those interest savings could be passed on to the city of Durango, should the municipality decide to buy water from the district in the future, Griswold said.

"We expect the cost of water would be about half (of what it is now)," he said.

A congressional conference committee passed the \$16 million appropriation for A-LP on Oct. 17. Federal officials expect the appropriations bill will be signed into law by President Bush.

The funding fell short of the \$21 million originally requested for the project for this fiscal year, but the lesser amount will pay for some key initial elements of the project – relocation of two natural gas pipelines, final design of the pumping plant and reservoir, and a study of archaeological sites that could be damaged by the construction.

The \$343.8 million A-LP project was authorized last year by Congress after the Clinton administration supported a scaled-back version. With the strong support of the Department of Interior and Colorado and New Mexico lawmakers, A-LP was approved by the House as part of an omnibus appropriations bill. The Senate later overwhelmingly approved the project.

The A-LP legislation spells out a seven-year time frame for completion, with funds appropriated on a year-by-year basis.

11/09/01

Utah Environmental Groups Strive to Halt Planned Dam

By Layne Miller Special to the Salt Lake Tribune

Several Utah environmental groups are supporting attempts to derail construction of a controversial dam near Durango, Colo.

David Orr, director of field programs for Living Rivers, with offices in Moab, is corraling Utahns to attend a rally in Durango today in opposition to construction of the Animas-La Plata project and support efforts to have the dam's authorization withdrawn.

"The project is one of the most controversial and contentious water development schemes in U. S. history," Orr said.

"Our campaign is designed to point out the deficiencies in the planning process for the project and to organize opposition against it."

Orr said a coalition of environmental and American Indian groups have agreed to attend the rally. Environmental groups include the Green Party of Utah, Great Old Broads for Wilderness, The Sierra Club and Utah Environmental Congress in addition to Living Rivers.

Under the current plan, the U.S. Bureau of Reclamation wants to divert 265,000 acre feet of water from the Animas River, just outside the city limits of Durango in Southwest Colorado.

The water will be pumped more than 500 feet uphill to a reservoir formed by the damming of Ridges Basin, a state wildlife area and elk refuge. The water will be used for industrial and culinary purposes.

The Animas-La Plata project was first proposed in the 1930s and was authorized by Congress in 1968.

In the face of criticism from taxpayer and environmental groups, the project was scaled back and the location of the dam moved.

In 1972, the Southern Ute and Mountain Ute tribes in Colorado went to court to claim 93,000 acre feet of water from the project under a promise they received from the federal government in a treaty signed in 1868. Under terms of the latest agreement the Utes will receive 60,000 acre feet of water from the project.

The project nearly died in 1995 when the U. S. House of Representatives stripped \$10 million from it. The money was restored last year only after pressure from Colorado Sen. Ben Nighthorse Campbell.

Although the Navajo and Southern Ute tribes support the project, Thomas Morris Jr., president of the DinZ Medicine Men's Association, said his group is opposing the project and will attend today's rally.

Morris said Navajo Dam on the San Juan River in Arizona and the Glen Canyon Dam on the Colorado River near Page, Ariz., which creates Lake Powell in southern Utah, have inundated many prehistoric and historic American Indian sites.

The Animas joins the La Plata River, which flows into the San Juan River, which then meets the Colorado River at Lake Powell.

"We must protect the resting places of our ancestors," said Morris.

Pat Schumacher, a spokesman for the Bureau of Reclamation office in Durango, said Wednesday that getting the \$710 million project approved was difficult, but compromises reached during the planning process have brought about a coalition of user groups that include non-Indians and three different tribes.

Archaeological work on the impacted area will comply with all laws relating to American Indian remains and artifacts.

"We know from our surface inventories that there are 300 archaeological sites in the reservoir basin," said Schumacher.

"We are working out a plan now with the tribes for what we will do with any burials we might find. That agreement is almost completed."

He said artifacts of significance will be stored at the Anasazi Heritage Museum near Dolores, Colo.

The archaeological work is scheduled to begin in the spring of 2002 and construction in 2003. © Copyright 2001, The Salt Lake Tribune

Glen Canyon Dam: Dam Failure Study

By Stephen E. Latham, Bureau of Reclamation July 1998

Note: This document is abridged

Purpose of Study

The purpose of this study is to estimate the magnitude of flooding that would result along the Colorado River from Lake Powell to Hoover Dam due to the failure of Glen Canyon Dam. This study was requested, pursuant to policy, by the Bureau of Reclamation. This information can be used in Reclamation's emergency action plan for Glen Canyon Dam, and as a reference in preparing inundation maps for areas downstream of the dam. It can also be used to help local authorities develop warning and evacuation plans.

Flood Scenarios Evaluated

The following two scenarios were considered to cover the range of events that could cause failure of Glen Canyon dam. Both scenarios represent worst-case scenarios that result in the largest uncontrolled releases of the reservoir. Various assumptions were made to help test the sensitivity of results to these assumptions.

1) Dam failure caused by foundation failure or other defect (Sunny-Day Failure). This scenario includes a 100-year base snowmelt inflow to Lake Powell.

2) Dam failure caused by overtopping brought about by the overtopping failure of Flaming Gorge Dam. This scenario involves an extremely large flood inflow to Lake Powell 580 miles upstream.

For this study, it was assumed that Flaming Gorge Dam would fail during overtopping. Should this overtopping failure occur with the starting reservoir water surface at normal capacity, a combined outflow of 5,320,300 acre-feet would result. With Lake Powell at its normal capacity (elevation 3700 feet), this combined outflow would exceed the available surcharge storage capacity at Glen Canyon by 2,498,560 acre-feet.

The flood forecasting computer program, BOSS DAMBRK (DAMBRK), was used to help prepare this study. For the Sunny-Day Failure, the initial water surface for the computer model was assumed to be elevation 3711, which is the design maximum water surface at Lake Powell. For the Overtopping Failure, the initial reservoir water surface for the computer model was assumed to be elevation 3700, or the top of active conservation pool. To determine the duration and magnitude of overtopping potential, a flood inflow hydrograph (due to the Flaming Gorge failure) was first estimated. The Dam Failure Inundation Study for Flaming Gorge Dam of January 1990, was used as a reference to help develop this hydrograph. Since that study ended at Green River, Utah (about 130 miles from the upper reaches of Lake Powell), peak discharges were extrapolated downstream to Lake Powell, and an estimated inflow hydrograph was generated using the Flaming Gorge failure volume (5,320,300 acre-feet). It would take roughly 34 hours for the maximum stage of the flood wave to arrive at the upper reaches of Lake Powell. Routing the estimated flood inflow hydrograph indicated that Glen Canyon Dam would be overtopped for a duration of about 40 hours, with a peak depth of 2.9 feet over the parapet wall.

While it is unlikely this overtopping flow would cause the dam to fail, for the purposes of evaluating this scenario, failure was assumed.

Outflow assumptions prior to the Overtopping Failure were as follows. Measures would likely have been taken at Glen Canyon Dam to lower Lake Powell, probably by opening the spillways 2 to 3 hours after notification of the Flaming Gorge Dam failure. Upon arrival of the flood wave at Lake Powell, it was assumed that the spillway gates would be opened uniformly to the normal maximum discharge of 238,000 cfs.

Study Results

Evaluation indicates that the leading edge of the flood wave from Glen Canyon Dam failure would likely reach Diamond Creek (Mile 225) in 10 hours to 12 hours for either failure scenario. This converts to a flood wave travel rate of 20 miles per hour (mph). Arrival of maximum flood stage would occur about 20 hours to 22 hours after dam failure.

The leading, edge of the Overtopping Failure flood wave would likely reach South American Point (Mile 296) in 13 hours to 15 hours after dam failure. This equates to a flood rate in the upper reaches of Lake Mead of 17 mph to 18 mph. Arrival of maximum flood stage would occur about 19 hours to 20 hours after dam failure

The reason for the maximum flood stage times at South American Point being less than at Diamond Creek is likely due to a combination of at least two things: 1) a much shallower channel slope at the upper reaches of Lake Mead, and (2) the fact that the canyon cross section at South American Point is suddenly very narrow and creates a constriction producing some backwater.

The Overtopping Failure of Glen Canyon was routed through Lake Mead and Hoover Dam. The results were practically identical for the water surface elevations assumed for Lake Mead. Assuming Hoover Dam does not fail, overtopping would begin about 23 to 24 hours after the failure of Glen Canyon Dam, continue for about 258 hours (10.75 days), and reach a peak depth of about 68 feet over the parapet wall on the dam crest at hour 74. The depth corresponds to a maximum water surface elevation in Lake Mead of 1304 feet. Maximum discharges would be about 485,600 cfs through the river outlet works, powerplant, and spillways, and 2.02 million cfs over the dam crest. This makes a total discharge immediately downstream from Hoover Dam of over 2.5 million cfs.

Obviously any type of structure less than 400 feet to 500 feet above the Colorado River between Glen Canyon Dam and Lake Mead as shown on USGS topographic maps would be completely inundated and destroyed by the flood from either type of failure. Even Navajo Bridge, which is about 400 feet above the Colorado River, could be damaged or destroyed. Results indicate depths of around 500 feet at this location. Flooding of this altitude here in the canyon would be very severe and lethal. Anyone still on the river at the time, would have to climb the equivalent of a 40-story building, at a minimum, to have any hope of surviving. The study indicated that the travel rate for the leading edge of the flood wave was estimated to be 20 mph to 25 mph. Although there have been no dam failures of this magnitude observed, historically, these travel rates may be reasonable for this huge a failure outflow. Some flood wave travel times from other dam failures with similar downstream reaches include:

(1) St. Francis Dam, California, failed on March 12, 1928. Flows traveled 18 mph in the first 1.5 miles downstream from the dam. Peak discharge unknown.

(2) Hell Hole Dam, California, failed on December 23, 1964. Flows traveled 14 mph through the narrow and uninhabited rock canyon 56 miles to Folsom Reservoir. Peak discharge was estimated to be 260,000 cfs. Volume released was 24,800 acre-feet.

(3) Teton Dam, Idaho, failed on June 5, 1976. Flows traveled 19 mph in the narrow canyon for 2.5 miles and averaged 16 mph for the first 8.8 miles downstream from the dam. Peak discharge was estimated to be 2,300,000 cfs. Volume released was 251,700 acre-feet.

(4). Little Deer Creek Dam, Utah, failed on June 16, 1963. Flows traveled 18.9 mph for the first 2.2 miles downstream from the dam, Peak discharge was estimated to be 47,000 cfs. Volume released was 1000 acre-feet.

The study indicated that flood depths in the upper reaches of Lake Mead would progress 507 feet at river mile 238, to 246 feet at river mile 281.5 (approximate end of Pearce Basin). More populated areas around Lake Mead that would be inundated include marinas, campgrounds, and other concentrations of population and activity. Water depths would be around 94 feet above the July target elevation of 1219.61 feet for Lake Mead.

Groups to Launch National Campaign to De-Authorize A-LP Water Project

Contacts

[Owen Lammers](#), Executive Director (435) 259-1063

[David Orr](#), Director of Field Programs (435) 259-1063

November 9, March & Rally in Durango, Colorado

MOAB, UTAH -- The Animas-La Plata (A-LP) project, one of the most controversial and contentious water development schemes in U.S. history, is the focus of a de-authorization campaign that will be launched November 9 by a coalition of Native American and non-Indian organizations. The project, which includes a dam, reservoir, pumping system, and water pipeline, was authorized last year by Congress without a hearing. Citizens have called foul, and are demanding that the government repeal the authorization legislation.

A rally will be held in Durango, Colorado on Friday, November 9 to announce the campaign and detail the proposed alternatives that the coalition supports.

The central element of the A-LP project is Ridges Basin Dam and Reservoir near Durango, which would inundate valuable wildlife habitat and an area of great archeological and historic significance to the indigenous people of the Four Corners region.

"We are energized by the support we're seeing for stopping this project, and doing what's right for our people and for the river," said Sage Douglas Remington, Director of Southern Ute Grassroots Organization and resident of Ignacio, Colorado. "Congress got hoodwinked last year into voting for the project without hearing from the people, but it's not too late to fix the mistake."

Recognizing that numerous big dam projects have been shelved in the past, despite authorizing legislation, the coalition members are optimistic that they can persuade Congress to authorize an environmentally sound and socially beneficial alternative while de-authorizing A-LP.

"The billion-dollar Auburn Dam in California has been stopped dead in its tracks for fifteen years because of citizen pressure," said Mike Black of Taxpayers for the Animas River, a leader in the effort to stop A-LP in his hometown of Durango. "Echo Park Dam in Utah, Orme Dam in Arizona, and Hooker Dam in New Mexico were all cancelled in the face of public opposition, and we'll do the same with A-LP!"

A-LP would cost upwards of \$500 million with no demonstrated need for the diverted and stored water. November 9 is the date when local water agencies must commit their token share of project costs. But Congress has not yet appropriated any of the 82 percent share of taxpayer funds necessary for construction to begin.

A major concern with the project is the proposed destruction of a ancient burial ground in the reservoir site, considered by traditional people to be sacred. A large number of graves would be dug up for the Ridges Basin Dam.

"We must protect the resting places of our ancestors," said Thomas Morris, Jr., President of the Diné Medicinemen's Association, and a resident of Window Rock, Arizona. "Too many of our sacred places have already been drowned, we can't let them keep taking more."

Morris noted that Navajo Dam on the San Juan River and Glen Canyon Dam on the Colorado River destroyed countless Navajo sacred sites. The medicinemen's association has called for decommissioning these dams and restoring the San Juan and Colorado as free-flowing rivers. "We must prevent additional damage," he said.

Environmental groups are supporting the indigenous peoples' concerns, and calling for an overhaul of the federal Bureau of Reclamation, the agency responsible for development of most of the rivers of the West. The A-LP project's construction is scheduled to begin in the agency's centennial year, 2002.

"We are asking the Bureau to shift away from reclamation toward restoration," said Owen Lammers of LIVING RIVERS. "The agency has never done the job it was given by Teddy Roosevelt in 1902, to promote small family farms; instead it has from the beginning acted as a subsidy for corporate agribusiness and real estate development. A-LP is one of the worst examples of this long, sad history."

The coalition is calling for major changes in the way the Reclamation agency does business, including ending support for corporate farms and requiring mandatory water conservation measures to be put in place for the first time. In the Colorado River basin, the coalition wants a full review of the entire plumbing system--all the dams and diversions--and to take down some of the dams, including Glen Canyon Dam near Page, Arizona.

"They've had a century to get it right, and they've failed miserably at their charge," said Lammers. "The only thing they've really succeeded at is turning the rivers of the West into an elaborate, expensive network of pipes, ditches, and canals, and in driving numerous species to the brink of extinction."

MARCH AND RALLY ON NOVEMBER 9

Members of the news media are invited to attend the rally and march on November 9, which will kick off at noon at Rotary Park at 15th Street and Second Avenue in Durango. Marchers will then proceed to the Bureau of Reclamation office at 835 Second Street, where they will present a letter to the agency and mail letters to the US Congress. Then the procession will travel westward down 9th Street to the rally site at Schneider Park, on the banks of the Animas River. Brief speeches will be given by key campaign leaders. Refreshments and musical entertainment will be provided.

Organizational representatives will be available onsite for interviews. The following groups have endorsed the event and campaign to date:

American Rivers, American Whitewater, Diné Medicinemens Association, Citizens Coal Council, Citizens Progressive Alliance, Colorado Environmental Coalition, Colorado Plateau River Guides, Colorado Rivers Alliance, Colorado Whitewater, Electors Concerned About Animas Water, Escalante Wilderness Project, Flagstaff Activist Network, Four Corners Riversports, Friends of Arizona Rivers, Friends of the Earth, Great Old Broads for Wilderness, Green Party of Utah, High Country Citizens Alliance, Living Rivers, Native Forest Network, Remarkable Earth Photography, Ridgeline & Open Space Coalition, San Juan Audubon, San Juan Citizens Alliance, Shared Blanket Gallery, Sierra Club, Southern Ute Grassroots Organization, Taxpayers for the Animas River, Tribal Environmental Watch Alliance, Utah Environmental Congress, and Wilderness Society.

GCMRC Comments to USFWS on Humpback Chub Recovery Goals

[CLICK HERE](#) to read recovery goal comments from Grand Canyon Monitoring and Research Center

Dr. Robert T. Muth, Director
Upper Colorado River Endangered Fish Recovery Program
U.S. Fish & Wildlife Service
P.O. Box 25486
Denver Federal Center
Denver, CO 80225

Re: GCMRC Comments on U.S. Fish and Wildlife Service's Recovery Goals for the Humpback Chub (*Gila Cypha*) of the Colorado River Basin A Supplement and Amendment to the Humpback Chub Recovery Plan (draft dated September 7, 2001)

Dear Dr. Muth:

We support the work of Region 6 in developing the draft recovery goals for the Humpback chub and appreciate the opportunity to comment on this draft. The development of effective recovery goals for the conservation of humpback chub is a monumental task. We acknowledge the work that has gone into this first step and hope that our comments can make a positive contribution to improving the final product.

On October 8, 1996, the U.S. Secretary of the Interior signed the Record of Decision concerning the operation of Glen Canyon Dam. This action, in combination with the Grand Canyon Protection Act of 1992, established the Glen Canyon Dam Adaptive Management Program (AMP). The AMP is composed of the Secretary of the Interior's Designee, the Adaptive Management Work Group (AMWG), the Technical Work Group

(TWG), the Grand Canyon Monitoring and Research Center (GCMRC), and independent review panels.

The AMWG and TWG have the responsibility of recommending management objectives associated with Grand Canyon resources and making recommendations for the development of a long-term monitoring program to assess those resources. GCMRC is charged with developing and implementing long-term monitoring and research programs to obtain information needed by the AMP.

The Humpback chub (*Gila cypha*) is one of a suite of resources that the AMP is charged with managing. Given that the largest and only known successfully-reproducing population of Humpback chub in the lower basin of the Colorado River is within the Grand Canyon and falls under the responsibilities of the AMP, it is appropriate that GCMRC offer comments on the Draft Recovery Goals. However, it should be noted that the comments contained within the attached document are solely the views of the scientists within GCMRC and may not reflect the views of all of the AMP participants.

The comments contained within the attached document are relevant to the September 7, 2001, draft of "Recovery Goals for the Humpback Chub (*Gila Cypha*) of the Colorado River Basin A Supplement and Amendment to the Humpback Chub Recovery Plan" (hereafter referred to as the "recovery goals"). The attached document is organized in 2 sections: (1) general comments on the process of developing the recovery goals, and (2) specific comments on the recovery goals. Within each of these sections, our comments are numbered to facilitate any responses that are forthcoming following the review process.

Sincerely, /s/
Dr. Barry D. Gold, Chief
Grand Canyon Monitoring and Research Center

Join river lovers and advocates from the Four Corners States and Indian Nations to launch the de-authorization campaign for the Animas La Plata Project...

When: 12:00 noon, Friday, November 9

Where: Durango, Colorado

Start at Rotary Park, 15th St.& 2nd Ave.
March to Bureau of Reclamation office, 835 E. 2nd Ave.
Then to Schneider Park - music & refreshments, 9th & Roosa

The Importance of the Animas River

The free-flowing Animas River is a critically important, life-giving force for the communities and economy of southwestern Colorado and northwestern New Mexico. It is one of the last remaining undammed rivers in the southwestern United States. Rising

in Colorado's San Juan Mountains, the Animas defines the heart of Durango, Colorado, as it passes through the city, and flows into the San Juan River near Farmington, New Mexico.

The Animas is the San Juan River's largest tributary; its flows help sustain the dying San Juan's ecosystem downstream in New Mexico, where its native fish populations have been rendered virtually extinct by numerous diversions and an unnecessary dam. The survival of the San Juan River, and the recovery of its ecosystem, may depend on keeping the Animas River alive and healthy.

The Tragedy of the A-LP Project

Authorized by Congress in 2000, the Animas-La Plata Project (A-LP) is a water-wasting, environmentally destructive boondoggle that will seriously impact both the Animas and San Juan Rivers. There is no demonstrated need for the project, it's merely a subsidy for real estate developers, coal companies, and electric power utilities.

A-LP was promoted to Congress as a water rights settlement for two Ute Indian tribes. The tribes could benefit far more by implementing environmentally sound alternatives to A-LP, but no alternatives were considered. Congress held no hearings on the project last year before voting to authorize it.

The half-billion dollar fraud will drain water from the Animas River at a point near downtown Durango, and pump it 500 vertical feet over a mountain to a proposed reservoir in Ridges Basin. This pristine mountain basin has been a prime area for human habitation dating back 8,000 years. Untold ancient burial sites are located there which hold great significance to traditional Native Americans, who strongly object to disturbing these remains. The basin is a critical wildlife habitat area and includes pristine wetlands which would be lost forever were the 215-foot high dam and its 1,500 acre reservoir to be constructed.

November 9 is the date when local water agencies must commit their token share of project costs. But Congress has not yet appropriated funds for the massive federal share of the project, so groundbreaking has been put on hold.

De-fund & De-Authorize A-LP!

River advocates from across the country want to keep it that way. Project opponents, led by LIVING RIVERS, are organizing to stop federal funding for A-LP and get Congress to de-authorize the project. For nearly half a century activists have succeeded in de-authorizing numerous dams around the country, and several in the Colorado River watershed. The most famous, Echo Park Dam, was proposed for Dinosaur National Monument. Ridges Basin Reservoir and the ALP will be next.

De-authorizing ALP is a key component of LIVING RIVERS' ten-point nationwide campaign to Reclaim the Bureau of Reclamation (BuRec). With its centennial coming up in June 2002, river activists are demanding that BuRec end its compulsive dam-building behavior and enter the era of dam removal and river restoration.

Join American Rivers, American Whitewater, Diné Medicinemens Association, Citizens Coal Council, Citizens Progressive Alliance, Colorado Environmental Coalition, Colorado Plateau River Guides, Colorado Rivers Alliance, Colorado Whitewater, Electors Concerned About Animas Water, Escalante Wilderness Project, Flagstaff Activist Network, Four Corners Riversports, Friends of Arizona Rivers, Friends of the Earth, Great Old Broads for Wilderness, Green Party of Utah, High Country Citizens Alliance, Living Rivers, Native Forest Network, Remarkable Earth Photography, Ridgeline & Open Space Coalition, San Juan Audubon, San Juan Citizens Alliance, Shared Blanket Gallery, Sierra Club, Southern Ute Grassroots Organization, Taxpayers for the Animas River, Tribal Environmental Watch Alliance, Utah Environmental Congress, and Wilderness Society and others to:

Rally & march for water to meet human needs, not corporate greed.

Celebrate & preserve Native American heritage, and protect ancient burial grounds.

De-authorize A-LP Now!

Take Action!

Please write to your Member of Congress at House of Representatives, Washington, DC 20515, and your Senators at U.S. Senate, Washington, DC 20505, and ask them to DE-AUTHORIZE A-LP!

LR Press Release 10/10/01

Dam Security Measures Flawed--Public Kept in Dark Over Risk

CONTACT: Owen Lammers, Executive Director, 435-259-1063, David Orr, Director of Field Programs, 435-259-1063

In the wake of the tragic airline hijacking attacks of September 11, 2001, emergency security measures have been put in place at major dams in the Colorado River system. But the newly evolving security plans of the federal government are flawed, and reflect a continuing unwillingness to seriously address dam safety issues, as before the attacks.

LIVING RIVERS has learned that the new measures instituted by the Bureau of Reclamation (BuRec) are weakest at two of the system's most vulnerable structures, Glen Canyon and Flaming Gorge Dams. The failure of either could set the stage for a series of catastrophic events with massive human and economic impacts from Utah to Mexico.

While federal resources are currently focused on protecting 726-foot Hoover Dam near Las Vegas from possible terrorist attack, comparatively little is being done at Glen Canyon Dam upstream on the Colorado River, and at Flaming Gorge Dam upstream on the Green River. These two dams represent the second and third largest dams, respectively, in the Colorado River basin, after Hoover.

Dam failure, whether caused by terrorist attack or by floodwaters, would cause not only catastrophic damage to the reservoir and immediate downstream areas, but also a possible "domino effect" that could result in major impacts on the water supply systems of more than 25 million people in the lower basin, and lead to economic disruptions in Nevada, Arizona, California, and northwestern Mexico.

Focus on Hoover Ignores Real Risks

While around-the-clock patrols at Hoover prevent boaters from approaching the dam within a mile upstream and a half-mile downstream, no such controls are in place at either Glen Canyon or Flaming Gorge. Boats may freely approach Glen Canyon Dam from the downstream side, and only a small-diameter cable 150 yards from the dam impedes boater access from the reservoir. Boats have free access to both the visitor center and dam area at Flaming Gorge.

Trucks and trailers are prohibited from crossing Hoover Dam, and passenger vehicles are subject to search by state highway patrol officers at checkpoints on either side of the dam. Yet truck traffic still flows freely over the crest of Flaming Gorge Dam and across the Glen Canyon Dam Bridge, as before September 11. No security checkpoints have been erected at either site.

Oddly, despite the extraordinary security attention Hoover is receiving, it is by far the best-constructed component of the Colorado River plumbing system. Built into massive igneous rock canyon walls and designed with enough mass for gravity to hold its reservoir--the nation's largest--in check, a major attack is unlikely to cause structural failure. The real problems are further upriver.

Near Page, Arizona stands 710-foot Glen Canyon Dam, tucked into porous, weak, Navajo sandstone that constantly leaks water around the dam. Large pieces of sandstone adjacent to the dam routinely break away. BuRec must install increasingly longer rock bolts in an ongoing attempt to protect the dam's powerplant from falling rock, and to ensure stability of the dam's abutment. This past summer workers could be seen patching the dam's face where massive slabs of concrete had fallen off.

In 1983, high water flows caused the dam's sandstone spillway tunnels to crumble in places, posing a threat to the integrity of the abutment. The dam's greatest vulnerability is in a high-water event.

Any compromise of the crumbling sandstone abutments would allow two years' annual flow of the Colorado River to blast its way around the dam, scouring the Grand Canyon before surging across Lake Mead on its way to Hoover Dam. In the best-case scenario, this water would flow over the top of Hoover, creating a downstream flood similar to that were Hoover to fail by itself. At worst, failure of Glen Canyon would compromise Hoover Dam, multiplying the flow by a factor of two, and sending four years' annual flow of the Colorado River heading toward Mexico all at once. "Glen Canyon Dam is an accident waiting to happen," said Owen Lammers of LIVING RIVERS. "Not only should security be stepped-up, but serious plans must be put in place for the dam's controlled decommissioning, as the dam very likely could fail on its own."

A failure at Flaming Gorge Dam, with a full pool of 3.7 million acre-feet, would threaten Glen Canyon Dam downstream if Glen Canyon's reservoir were incapable of accommodating the inflow. This is often the case during peak flow periods in the spring and early summer. As at Glen Canyon, security at Flaming Gorge is comparatively weak.

Regardless of the scenario, the most significant damage would occur below Hoover Dam. Despite their smaller size, Davis, Parker and Imperial Dams constitute critically important elements of the Colorado River plumbing system. These dams are not constructed to absorb massive inflows, and would be severely damaged by a catastrophic flood event. The Central Arizona Project Canal, California Aqueduct, and All-American Canal — the region's major water delivery systems — would also be jeopardized. Municipal water supplies for cities from Las Vegas to San Diego could be wiped out.

The riverside communities of Laughlin, Nevada, Needles and Blythe, California, and Bullhead City, Lake Havasu City, and Yuma, Arizona are all at risk in the event of a major lower basin flood. The reservations of the Fort Mojave, Colorado River Indian Tribes, Chemehuevi, Cocopah, and Quechan nations lie along the lower river and are all at great risk of flooding, as are numerous Mexican farming communities in the Colorado River delta region. Three interstate highways and numerous oil and gas pipelines cross the river below Laughlin.

The federal government is supposed to make available dam failure inundation maps to inform the public of these potential threats. However, BuRec recently told LIVING RIVERS that access to these maps is restricted under new security measures. LIVING RIVERS has filed a Freedom of Information Act request, which had not yet been honored at presstime.

"We certainly don't want to aid any terrorist in mapping out potential targets, but these safety concerns exist regardless of the threat of terrorism," said Lammers. "It's time for the Bureau to get serious about addressing dam safety, starting with ensuring the public is fully aware of the risks its projects pose."

LR in the News 10/03/01

Delta restoration meets resistance from water users

GREENWIRE April Reese, Greenwire staff writer

For most of a century, the southwestern United States has relied on Colorado River water to slake the thirst of its cities and water its crops. But now, just as growth in the region is projected to skyrocket over the next several decades, users are being asked to accommodate the needs of another recipient of Colorado River water: the river's delta.

Although a first-ever delta symposium attended by state and federal water officials, scientists and environmentalists offered hope to some that at least some additional water could eventually be sent to the delta, all of those involved acknowledge the high demands placed on limited resources will make accommodating ecological needs extremely difficult.

Historically, the delta, where the river flows into Mexico's Gulf of California, received an average of 16.7 million acre-feet (maf) of water from the river each year. Now, the delta receives about 4.2 maf per year -- a decrease of about 75 percent. (An acre-foot equals 326,000 gallons, or the amount of water that would cover a football field without the end zones to a depth of one foot.) That decrease, as well as conversion of wetlands into farmland, has reduced the delta's wetlands to less than 10 percent of their historical extent, from 1.93 million acres to about 150,000 acres, according to a report by Environmental Defense.

According to NASA's Earth Observatory program, which tracks changes in the delta using satellite images, "Irrigation and urban sprawl now prevent the river from reaching

its final destination. ... Nearly all the water that flows into the Colorado River is now siphoned off for use in crop irrigation and for residential use."

Nonetheless, the delta remains a key stop along the Pacific Flyway and supports many species of wintering waterfowl. It also harbors the largest known populations of two endangered species, the desert pupfish and the Yuma clapper rail.

In some recent years, El Nino effects have sent torrents of water down the river, boosting flows and allowing some water to reach the delta. But it's "hit or miss," with a significant amount of water making it to the sea some years and none reaching it in others, says Ed Glenn, an environmental science professor at the University of Arizona who has studied the ecosystem.

Getting more water to the delta would involve an extraordinary level of collaboration, involving two countries, nine states (seven in the United States and two in Mexico), millions of water users, and 1,450 miles of river. Although environmentalists say even a small influx of water could go a long way in reviving the delta, skeptics say galvanizing the necessary political will to send any additional water downstream will be a considerable challenge.

The basin, which drains 244,000 square miles, is managed under a complex set of state and federal laws, court decisions, an interstate compact and an international treaty, all collectively known as the "Law of the River." Under those mandates, 7.5 million acre-feet of water is fed to the upper Colorado River Basin (Colorado, New Mexico, Utah and Wyoming), another 7.5 million acre-feet of water is sent to the lower basin states (Arizona, California and Nevada); and 1.5 million acre-feet crosses the border into Mexico. Over 25 tribes also have water rights to the Colorado.

Under the current allocation scheme, a state such as California, where demand exceeds its legal allotment, can meet its needs by getting surplus water from other basin states. But as the growing cities of upper basin states demand more water over the next few decades, surpluses will no longer be available to send elsewhere. These "combustible realities," as former Interior Secretary Bruce Babbitt called them, make it highly unlikely that state water managers will be willing to send water downstream to replenish the delta, some environmentalists and water officials say.

California has come up with a plan to gradually reduce its reliance on Colorado River water to its 4.4 maf limit over a 15-year period, but those measures could cause problems in themselves, environmentalists say. For example, a plan to line canals so that less water seeps into the groundwater would save water for California, but would reduce the amount of water that makes its way into Mexico through the aquifer. And an interim plan to cover the state's water needs while it works toward its 4.4 maf goal guarantees California surplus Colorado River water every year until it reaches its legal allotment -- surpluses some environmentalists say should be sent to the delta instead.

"It won't impact the basin states, but it may impact what administrative waste that goes to Mexico," says Larry Anderson, director of the Utah Division of Water Resources, referring to the water headed for California under so-called Interim Surplus Guidelines.

The fervent opposition of some states, such as California and Arizona, to delta conservation "is indicative of the backwards, oftentimes knuckle-dragging mindset of western extractive agencies in those states," Hogan charges. He allows that some states are reacting from a practical concern about competition for scarce water resources, but adds "most of the opposition is the result of a nearly religious sentiment that any water not used by humans is wasted water."

And some are concerned increased flows may end up in Mexican farms and cities instead of in the delta. Said Anderson: "Let's just say the basin states were willing to find a block of water. Say we'll send down 30,000 acre feet. What is the guarantee that that water will ever get by the diversions for agricultural use in Mexico?"

Glenn disagrees. "Even without that water, they've done more than their share for those species," he said, pointing out that the Mexican government has created a biosphere reserve in part of the delta. "The agencies that have made those claims are the same ones that have attempted to sabotage a dialogue with Mexican agencies to work toward just that result," Hogan adds.

Environmentalists and some scientists say fears about the delta siphoning water from human needs are largely unfounded. According to separate reports by the Center for Biological Diversity and Environmental Defense, the delta could be returned to health with an increased water flow of as little as 1 percent, requiring relatively painless adjustments in water use, such as enhanced conservation and improving irrigation systems' efficiency.

"The environment has to have some standing at the table," says Glenn. "It only needs 1 percent. The delta is probably the smallest user on the river." Ironically, Glenn says, because only a small part of the original delta remains, little water is needed to replenish the wild areas that are left.

But little is known about how the delta ecosystem functions or exactly how much water would be necessary to restore it to at least some of its former glory. Although studies have been conducted on water levels needed to support vegetation in the delta, little is known about the needs of its fish and wildlife.

"I don't know that we've received the data that justifies an immediate decision," says Anderson. "When you ask for hard facts -- Will you need more? Could you do it with less? -- no one can give them to you."

But Lisa Force, program director for Living Rivers, says there is enough evidence of the delta's decline to merit immediate action. "The delta needs water now," she says. "If we're not careful, the delta could be studied literally to death."

Last December, the International Boundary Waters Commission, the government body that governs water management along the border, issued a "conceptual minute," known as Minute 306, that officially recognizes the need to "ensure use of water for ecological purposes" in the delta, and called for cooperation by the United States and Mexico in studying the ecosystem. Delta advocates say that although it is not a commitment to

take specific action, the framework is the first step to improving the ecological health of the delta.

That so many interested parties attended last month's symposium, held in Mexicali, Mexico, was a sign to some that a solution to the problem may not be so far off. "Even some of the 'water buffalos' recognized there could be enough water for the delta," said Glenn.

In the United States, the Lower Colorado River Multiple Species Conservation Plan calls for the Bureau of Reclamation (BuRec) and other water agencies to commit a certain amount of water to support over 50 endangered and threatened species in the lower U.S. stretch of the river. Ironically, however, that arrangement could threaten implementation of Minute 306, environmentalists fear.

Although the Law of the River does not include specific provisions for conservation, it does give BuRec -- the Colorado's "water master" -- some discretion in determining how the river is managed, Hogan says. That wiggle room allows the agency ample opportunity to "do what's necessary to protect the environment," Hogan adds.

Bob Walsh, spokesman for BuRec's Lower Colorado Region office in Boulder City, Nev., says it will be difficult, if not impossible, to change the current allocation framework to accommodate the delta. "The water is allocated by law, by Supreme Court decree and by treaty from Mexico, and you don't just change those things," says. "It would probably be a very long and litigious process to do that."

Instead, he says, agencies should find ways to work within the existing legal framework. For instance, purchasing marginal farmland to take it out of production could help decrease the demand for irrigation water, and agricultural wastewater could be directed to the delta, he says. Others suggest making water conservation a priority in the basin states to lessen demand.

"That's where the water would have to come from," says CBD's Hogan. "The best way to fight fear is with truth. The truth is that with strong water conservation and efficiency measures -- including limits on gross water use for such things as Las Vegas fountains and L.A. golf courses -- there is enough water for both people and long-term conservation of the river in the U.S. and its delta in Mexico."

Delta Remains at Odds With Water Rights

BY BRENT ISRAELSEN THE SALT LAKE TRIBUNE

MEXICALI, Mexico -- Once a thriving wilderness of nearly 2 million acres, the Colorado River delta is a remnant of its former self, its water and nutrients cut off by development along the river's 1,450-mile run from the Rocky Mountains to the Gulf of California.

It has been that way for decades, a seldom-discussed consequence of the much-heralded era of dam building on the Colorado that transformed deserts into farms and gleaming cities.

"It has been an abandoned topic," said Olga Ojeda Cardenas of the Mexican Secretariat of Environment and Natural Resources.

Today, the delta's plight is officially out in the open.

About 400 water users, bureaucrats and researchers from the United States and Mexico assembled here this past week to learn more about what is happening at the end of the Southwest's most important river.

Utah, a major river user, sent a delegation of five, including three representatives from the Utah Division of Water Resources and two assistant attorneys general.

The two-day Colorado River delta symposium at the Autonomous University of Baja California was the first meeting of its kind on the delta, which some observers believe could become the next big issue on the Colorado, one of the most fought-over rivers in North America.

The symposium's enthusiasm was dampened significantly by Tuesday's terrorist attacks on America. Mexican participants expressed condolences to their American counterparts, which included State Department and Interior Department officials, many of whom were ordered by their superiors to return to the United States for fear of further attacks on U.S. structures, such as dams.

Although the symposium was designed to be informational -- with experts from both sides of the border explaining the laws, plumbing systems and environmental research -- the question of how to solve the delta's problems was unavoidable.

To environmentalist Lisa Force, the answer is simple.

"What the delta needs is more water," said Force, of Living Rivers, an activist group that has lobbied to put the issue on the international agenda.

Before humans began altering the river, the estuary received from 10 million to 25 million acre-feet of fresh water from the river each year. One acre-foot equals about 326,000 gallons. The water fed a lush, 1.9 million-acre ecosystem that teemed with vegetation, fish and wildlife that supported the Cucapa Indians, whose traditional way of life has been imperiled by the delta's decline.

Today, flows to the delta range from 2.4 million acre-feet to as little as a few thousand. And it is of poor quality, laced with urban and agricultural pollutants.

Thanks to above-normal precipitation in the late 1990s, the delta ecosystem, once considered "dead," has rebounded to about 150,000 acres, prompting scientists and environmentalists to call for efforts to maintain, even enhance, delta restoration.

Researchers say maintaining and improving the delta ecosystem would require annual dedicated flows of about 32,000 acre-feet of water, with a larger "pulse" flow of about 260,000 acre-feet every three years to soak the floodplains and stimulate seed germination.

Bennett Raley, assistant Interior secretary for water and power, said he and Interior Secretary Gale Norton consider the Mexican delta "an important ecological resource."

But to restore or maintain it will take creativity and a political resolve that appears elusive at this time.

The obstacle, of course, is that the river already is almost fully tapped. In the case of California, which gulps 18 percent more than its share of 4.4 million acre-feet, the river is overused.

California's overconsumption is possible largely because the Upper Colorado River Basin states of Colorado, Utah, Wyoming and New Mexico use less than two-thirds of their 7.5 million acre-feet share. (Utah currently draws about 900,000 acre-feet from its allotment of 1.7 million acre-feet.) To protect their rights, the Upper Basin States are wary of any calls for more water downstream.

U.S. officials also have been cool to the idea of releasing more American water for the delta.

Federal Bureau of Reclamation Commissioner John Keys, who was not at the symposium, has offered to assist the Mexicans in utilizing their 1.5 million-acre allotment more efficiently, with the saved water dedicated for the delta.

"It's a lot easier to send money and expertise [to Mexico] than to send water," said Wayne Cook, director of the Salt Lake City-based Upper Colorado River Commission.

D. Larry Anderson, director of the Utah Division of Water Resources (DWR), says he does not want the delta to dry up, but he wonders whether saving it is a U.S. responsibility.

"If we have an environmental problem in the United States, there's no way we are going to get Mexico to give us some of their water, so why should we consider giving them water?" said Anderson.

Environmental activists argue that the flows needed for maintaining the restored delta are achievable through conservation or by shifting use of Colorado River water away from low-value, high-water crops such as alfalfa.

Another possible solution calls for the purchase of water rights from some farmers in Mexico, keeping the water in the river for the delta.

The International Boundary and Water Commission (IBWC), which oversees the Mexican-American water treaties, has set up working groups to draft proposals for maintaining the delta. American IBWC Commissioner Carlos Ramirez said there is no timetable for that work.

If the solution mandates additional releases from the United States, some U.S. water users fear that Mexico, whose border towns of Mexicali and Tijuana are growing rapidly, might divert delta-dedicated water for urban needs.

J. Arturo Herrera, Mexican member of the International Boundary and Water Commission, said they shouldn't worry. "We have the legal means to ensure the allocation is used for that purpose."

Mexican environmentalist Carlos Yruretagoyena doubts the debate will ever get that far: "Take one drop of water from someone in the United States for Mexican needs? I don't see it happening."

Stakeholders From U.S. and Mexico Release Principles to Guide Restoration

MEXICALI, BAJA CALIFORNIA, MEXICO – In order to restore the damaged Colorado River Delta, the area needs water. That was the central message of a historic binational conference hosted by the International Boundary and Water Commission (IBWC), the United States Department of the Interior, and the Mexican Secretariat of Environment and Natural Resources (SEMARNAT). The participants presented research on a wide range of legal and scientific issues that affect the Colorado River Delta and surrounding areas, but the heart of the matter was water.

"For the first time, researchers, policy makers and stakeholders from the United States and Mexico have come together to learn about the delta and steps already underway to protect and restore it," noted Michael Cohen, Senior Associate at the Pacific Institute for Studies in Development, Environment, and Security. "Yet this symposium is only a first step. Now that we all know the condition of the delta, we must take action to ensure that the delta's needs are met. The principles and recommendations devised by some 20 groups from Mexico and U.S. will guide us in the right direction as we begin the work of meeting these needs," continued Michael Cohen.

One Percent of River Flow Could Save Delta

"This is an important conference because water users in the U.S. and Mexico have finally acknowledged that, despite their best intentions, too much Colorado River water is being used along the way," said Ed Glenn, Professor of Soil, water, and Environmental Science at the University of Arizona. The good news according to

professor Glenn: "As little as 1 percent of the river's flow might be enough to preserve key habitats."

"The symposium and treaty amendment give cause for hope," concurred David Hogan, Urban Wildlands and Rivers Program Coordinator for the Center for Biological Diversity. "But not one drop of water is legally dedicated to nature, so we look forward to working with others to strike a balance between water for agriculture, cities and the delta environment."

"This conference is a strong indicator of how committed the two governments are to seriously addressing the imperative of Delta restoration," said William Snape, Vice President for Legal Affairs at Defenders of Wildlife. But "The delta needs water now," added Lisa Force, Program Director for Living Rivers. "If we're not careful, the delta could be studied literally to death. The Mexican and U.S. governments and Colorado River water users need to commit to secured flows for the delta, as prescribed by the science already completed, while further studies proceed."

Participants at the conference pointed to the cooperation between U.S. and Mexican stakeholders as a key part of any solution: "Getting a good understanding of water and environmental laws in the U.S. and Mexico is an important ingredient to solving the problems in the delta," said Steve Glazer, Chair of the Sierra Club Colorado River Task Force.

Jennifer Pitt, Senior Analyst with Environmental Defense added that, "the international border creates a real challenge to good ecosystem management, but if the United States and Mexico can continue the dialogue started here, there is hope for the river."

River Restoration Faces a Host of Challenges

The symposium is an important first step towards delta conservation, but other activities in the U.S. may limit the effectiveness of Minute 306, as the agreement between Mexico and the U.S. to cooperate on Colorado River Delta restoration is called.

Among these challenges: The Bureau of Reclamation has recently approved the Interim Surplus Guidelines and water-banking regulations, which will markedly reduce the delta-nourishing floods that once spilled from Hoover Dam. And the U.S.-based Lower Colorado River Multi-Species Conservation Program may also significantly undermine the success of the agreement.

"The state's multi-species program is a real threat to the delta because contracts under the program will tie up any water which might otherwise be available for delta conservation," stated David Hogan of Center for Biological Diversity. "Both the U.S. and Mexican governments need to step up to the plate on delta restoration. With the principles contained in the binational declaration, we have created a framework for moving forward," summed Pam Hyde, Director of Policy for Southwest Rivers. "But the question remains: Do we have the political will to protect and restore this unique area for future generations?"

River News 09/02/01

Binational Declaration for the Colorado River Delta

Whereas the Mexican and United States governments, through Minute 306 of the IBWC/CILA, have agreed to:

"establish a framework for cooperation by the United States and Mexico through the development of joint studies that include possible approaches to ensure use of water for ecological purposes in this reach [of the Colorado River] and formulation of recommendations for cooperative projects, based on the principle of an equitable distribution of resources."

Whereas management over recent decades in both Mexico and the United States has devastated the Colorado River's ecosystems;

Whereas the historical record of Colorado River flow has been estimated at approximately 15 million acre-feet per year, and in recent years the flow below the last major diversion at Morelos Dam is often only 0.2% of the river's estimated historical annual flow;

Whereas the 1944 Colorado River Treaty grants to Mexico the annual right to only 1.5 million acre-feet of Colorado River water (plus 0.2 million acre-feet under certain conditions) while the Colorado River Compact grants to the United States the annual right to up to 16 million acre-feet;

Whereas the Colorado River delta encompasses several important ecosystems in need of conservation attention, including the Colorado River riparian corridor south of Morelos Dam, the open water wetlands of the Cienega de Santa Clara, the Colorado River estuary at the northern Gulf of California, and numerous brackish wetlands throughout the historic delta;

Whereas the Colorado River riparian corridor below Morelos Dam has demonstrated marked regeneration and resilience in response to recent flood releases from Hoover Dam and the Gila River, and now contains more native riparian habitat than the reach of the river from Hoover Dam to Morelos Dam;

Whereas preliminary estimates indicate that the Colorado River corridor below Morelos Dam must continue to receive at minimum an instream flow of 32,000 acre-feet annually in addition to periodic floods of 260,000 acre-feet on average every four years in order to sustain endangered species such as the Southwestern willow flycatcher, in addition to a rich diversity and abundance of other terrestrial and aquatic species;

Whereas the Cienega de Santa Clara was created by irrigation return flows from the United States and must continue to receive approximately 135,000 acre-feet of water annually with salinity no higher than present levels (2,400 ppm) in order to remain a significant wetland, providing habitat for thousands of migrating and resident waterfowl and endangered species including the Yuma clapper rail and the desert pupfish;

Whereas the Colorado River estuary at the northern Gulf of California was historically one of the world's largest and richest desert estuaries and provided important habitat for Gulf fisheries, shorebirds, migratory birds, and the now endangered vaquita porpoise and totoaba, and will require freshwater flows of unknown quantities to restore its ecosystem;

Whereas the numerous brackish wetlands that remain throughout the historic delta have not been well studied, but provide habitat for thousands of migrating and resident waterfowl, and rely on an unknown quantity of agricultural drainage from the surrounding San Luis and Mexicali agricultural valleys;

Whereas several actions recently taken or proposed within the United States threaten the existence of the Colorado River delta's ecosystems, including the use of water under the Interim Surplus Guidelines and the development of off-stream banking, both of which will eliminate flood releases from Hoover Dam and devastate the native riparian corridor below Morelos Dam, and the operation of the Yuma Desalting Plant, which will destroy the Cienega de Santa Clara;

Whereas surface water and groundwater are inseparable in the Colorado River watershed, and both water quantity and water quality are integral to ecosystem health;

Whereas the human communities in and around the Colorado River delta are impacted by the decisions of agencies both near and far that manage the River and its resources;

Whereas the participation of informed stakeholders promotes the development of sound, acceptable restoration alternatives, and Mexico and the United States have to date implemented Minute 306 with participation from Colorado River stakeholders;

The undersigned Mexican and United States conservation organizations do hereby declare that their governments should consider and adopt the following recommendations in a collaboration to restore the Colorado River delta ecosystems:

The United States and Mexico must commit to dedicating freshwater for the purpose of protecting and restoring the ecosystems of the Colorado River delta, before they are further degraded.

The United States and Mexico must adopt the precautionary principle and integrate it, based on the best available science, into existing programs. The precautionary principle would dictate that neither country should take unilateral actions that limit future actions for restoring the Colorado River delta's ecosystems.

The highest priority must be placed on determining the amount, quality, and timing of water deliveries necessary to sustain and restore Colorado River delta's ecosystems, including the riparian corridor below Morelos Dam, the Cienega de Santa Clara, the River's estuary, and other brackish wetlands.

A scientific approach that uses experimentation and includes specific milestones for long-term monitoring, as well as the flexibility to respond to new information, should be

used to determine the quantity and quality of freshwater needed to protect and restore the Colorado River delta's ecosystems.

The United States and Mexico should work together to secure funding both for research needed to develop alternatives to protect and restore Colorado River delta's ecosystems, and for the implementation of those alternatives.

Research and development of alternatives for protection and restoration of delta ecosystems must acknowledge the interconnectivity of groundwater and surface water.

The development of alternatives to protect and restore the Colorado River delta's ecosystems should be transparent and inclusive, and the United States and Mexico should include stakeholders on both sides of the border in the development of any agreements to provide these ecosystems with water.

Banning Jet Skis on Lake Powell

Lake Powell Jet-Skiers Argue Against Any Ban

By Tom Wharton THE SALT LAKE TRIBUNE

The National Park Service asked for public input this week on how personal watercraft -- known by brand names such as Jet Ski or Waverunner--should be managed at Lake Powell.

A court settlement between the federal agency and the environmental group Bluewater Network mandated that an environmental analysis be done on use of personal watercraft at the 1.2 million-acre Glen Canyon National Recreation Area.

Under that deal, jet-skis will be banned at Lake Powell after Sept. 15, 2002, without a specific rule allowing their use. Alternatives being examined include continuing existing practices, allowing use of the craft in specific areas, restricting them in sensitive areas, limiting their use to the main channel or banning them.

With more than 10,000 jet-skis registered in Utah, owners had plenty to say at Park Service meetings Monday in Page, Ariz., and Tuesday in Salt Lake City.

The public comment is part of a study looking at how use of the craft-- which make up 9 percent of the registered vessels on Lake Powell --affect the area's visitor experience and natural resources.

Some said the agency had made up its mind to ban the craft.

"It is a stacked deck in favor of the Park Service," said Bill Lindsey of Bountiful, who is against the ban. "They want to ban all two-stroke engines and then ban all the people. "

Moab-based Living Rivers favored a ban.

"Jet-skis are disproportionately responsible for accidents, injuries and deaths relative to other watercraft," said David Orr, the group's director of field programs.

According to Park Service officials most of those who commented want to continue allowing unlimited use on the 180-mile-long lake.

According to Ted Woolley, boating coordinator for the Utah Division of Parks and Recreation, a youth personal watercraft education program put into effect in 1994 has reduced accidents and injuries. He favors a mandatory licensing program for all boats, not just jet-skis.

"Our constituency wants us to be fair," said Kitty Roberts, the superintendent of Glen Canyon National Recreation Area. "And education is a big theme."

Living Rivers Forces "Lake" Powell Friends to Staff-up

Making friends: Nonprofit group *Friends of Lake Powell* hires executive director
By Seth Muller Lake Powell Chronicle August 15, 2001

From its grass roots beginnings to its status as a viable and politically recognized nonprofit organization, the Friends of Lake Powell has moved into a new phase with the creation of a paid director position.

Former Page economic development director Diane Hansen, 34, returned to the area to serve as the Friends of Lake Powell executive director, and is not taking the job lightly. Her work involves boosting membership, educating the public and gaining recognition for the organization.

"Our overall mission is to promote the positive aspects of Lake Powell and Glen Canyon Dam through education and public awareness," Hansen said. "Since the organization formed in 1997, it has relied on volunteers, but the work became overwhelming as the issues (with the lake) went public."

The issues came to light during the past few years as a group of environmentalists known as the Living Rivers want to see the lake drained. While the Friends of Lake Powell stands in opposition of draining the lake and is vocal on the issue, its primary focus is to promote the positive aspects of Lake Powell, Hansen said.

The organization is now 2,000 members strong and the growth has brought the need for a full-time, paid position.

Charter board member Steve Ward said the hiring of an executive director was inevitable.

"I think we've always known we would need a paid position," Ward said. "We know we'll also need a paid staff."

Board member Paul Ostapuk believes Hansen will increase the organization's viability.

"With Diane, we will take membership to new levels," he said.

Ward led a small tour on Lake Powell Aug. 2. He took Hansen and Ostapuk to places like Independence Cove and Face Canyon to get them some time on the lake and show them areas where the amount of carved graffiti has increased.

One of the projects Friends of Lake Powell plans to undertake is the removal of the vandalistic carvings. The project will involve a partnership with the National Park Service, which started efforts to remove the graffiti this spring.

While Hansen enjoyed getting some time on the lake during the trip, she spends most of her time working out of the Page-Lake Powell Chamber of Commerce, where her office is located.

Hansen is currently working closely with U.S. Rep. John Shadegg's office on upcoming projects and continued political support. Shadegg, R-Phoenix, strongly advocates the preservation and improvements on Lake Powell. He recently proposed an amendment to a Coast Guard bill to examine the carbon monoxide problem on houseboats.

Hansen's work further includes updating all of the organization's literature, working on the membership database, attending meetings and forums as a representative of Friends of Lake Powell and responding to e-mail and requests for information.

Hansen said a number of inquiries come from college students who are working on papers concerning Lake Powell.

Hansen is enthusiastic about her new position that serves as a milestone for Friends of Lake Powell.

"Having a full time director takes it to another level," Hansen said.

Arizona Republic Op Ed on Gail Norton's visit

ARIZONA REPUBLIC

August 7, 2001

Interior chief needs to talk conservation

Secretary of the Interior Gale Norton is coming to town.

She will be in Flagstaff tomorrow and Phoenix on Thursday to talk about water, the most vital natural resource in the arid Southwest. We welcome Secretary Norton's attention to this issue on which our cities, jobs and ecosystems depend.

The situation with water in the Southwest has come down to this: we're running out.

The Colorado River, our primary source of water in Arizona, has been over-allocated, meaning more water has been promised to the seven Basin states and Mexico than exists. This hasn't been a problem so far because some of the states haven't needed their full allocation. But that's over.

According to the 2000 U.S. census, four of the five fastest-growing states in the country are in the Colorado River Basin, with populations, ecosystems, growth and economies all dependent on Colorado River water. The growth boom in those states, including Arizona, is expected to continue.

Meanwhile, groundwater tables are dropping, rivers are drying up, habitats and species are disappearing and battles over the last remaining aquifers are reaching fever pitch.

Suggested new sources such as importation of water from Canada, trans basin exchanges, "glacier mining" and construction of new dams do not create more water.

Moreover, these proposals are simply methods for moving water around, when the real issue is how to use water more efficiently.

Unfortunately, the secretary's visit will include only water-movers: Central Arizona Project, Colorado River dam operators, Sen. Jon Kyl, R-Ariz., and Gov. Jane Hull. Yet the only long-term feasible new source of water is conservation.

Norton often cites natural resource conservation as a goal of the current administration. In fact, she consistently states her desire to develop workable, consensus-based programs and cites her "4 C's: communication, consultation, and cooperation, all in the service of conservation." Yet when Living Rivers, representing more than 130 conservation organizations, requested a meeting with Norton during her Arizona visit, we received a swift and blunt "no" from the secretary's office.

We hoped to discuss with Norton Colorado River management issues, particularly preservation of the Colorado River delta, which would require less than 1 percent of the river's flow and could be achieved through very modest conservation measures. The

delta is just one of several Colorado River-dependent ecosystems that is on the verge of disappearing due to near-total diversion and pollution of the river's flows.

Conservation will be effective for preserving ecosystems, as well as for satisfying the needs of increasing human populations, for one simple reason. Ecosystems are dying not because nature has been stingy with water but because humans have wasted it with impunity.

Agribusiness dumps billions of gallons of water on crops never meant to grow in the desert, using flood irrigation, the most wasteful technique available.

Secretary Norton, we understand that there are many interests who want your attention during your visit, and that you must be selective. Again, we encourage you to select a constituency of 12 million Americans, the largest coalition of groups ever to form around Colorado River issues, for a discussion concerning conservation. We respectfully request a 30-minute meeting. That's 0.00015 seconds per person. We'll be brief.

Lisa Force is program director of Living Rivers, a national non-profit organization with offices in Utah and Arizona. She is based in Scottsdale.

08/07/01

Interior Secretary Norton Refuses to Meet with Environmentalists

Contact: Lisa Force, Living Rivers (480) 990-7839 or (602) 321-1753
David Hogan, Center for Biological Diversity (619) 523-1498
Owen Lammers, Living Rivers, (435) 259-1063

U.S. Interior Secretary Gale Norton has refused a request sent last week by an environmental coalition to meet and discuss Colorado River conservation issues during her Arizona visit this week. The environmental coalition had hoped to discuss with Norton several Colorado River conservation and management issues such as the delta and faulty Lower Colorado River Multi-Species Conservation Program.

Living Rivers sent a letter requesting the meeting on August 3rd on behalf of itself, the Center for Biological Diversity, Friends of Arizona Rivers, Environmental Defense, Southwest Rivers and the Pacific Institute. Conservation of the Colorado River delta is a top concern for the groups. The issue has galvanized the largest coalition ever formed promoting Colorado River restoration: 130 organizations representing 12 million people from the US and Mexico. An Interior spokesperson declined to explain Norton's refusal to meet with the groups.

"We are disappointed in Secretary Norton's initial refusal to meet with our coalition," said Lisa Force, Program Director of Living Rivers. "We're hoping she'll reconsider given the importance of the delta and the number of people who are concerned with its protection."

The Colorado River delta is of international importance, yet today is facing a water crisis. The delta has been reduced to less than ten percent of its original size due to the near-total diversion of the river's flows on both sides of the border. Water banking, offstream storage, and other efforts to divert even more water for urban sprawl and agribusiness have put wildlife, fisheries, bird populations, indigenous communities and the total ecosystem at risk.

Scientists have made preliminary estimates that the delta conservation process can begin with a modest amount of water - less than one percent of the river's average annual flow. "Southwestern states and the federal government have so far rejected the notion of providing so much as a drop of guaranteed water for delta conservation," said David Hogan, Rivers Program Coordinator for the Center for Biological Diversity. "They're just not willing to budge."

"Addressing the major issues on the Colorado River will require reaching out to all interested groups, not just the traditional water and power interests," says Michael Cohen of the Pacific Institute. "By ignoring environmental interests, Secretary Norton does a real disservice to the rising spirit of cooperation in the basin."

Environmentalists have led recent efforts to bring the basin states, federal agencies and other stakeholders to the negotiating table to discuss delta restoration. In December 2000, an accord was signed which commits the U.S. and Mexico to discuss studying the delta problem. "Closing the lines of communication just moves everyone back a step," says William Snape of Defenders of Wildlife. "The accord commits the US and Mexico to open dialogue that includes environmental groups. Secretary Norton's refusal to meet with us violates the spirit of the accord."

McDonald's Attracts Criticism from Activists

THE SALT LAKE TRIBUNE

Saturday, August 4, 2001

By Brent Israelsen

In the realm of modern marketing schemes, this one seems rather tame: Offer the hamburger-buying public the chance to win cash, electronics, vacations and vehicles.

But McDonald's Corp. -- regular target of criticism for its food and global corporate imperialism -- has managed yet again to attract activist ire. This time, it's about a category of prizes McDonald's is awarding in its Monopoly game promotion.

Collect all four railroads and you win a snowmobile, an all-terrain vehicle (ATV) or a personal watercraft -- all of which are despised by environmentalists. "This is about

promoting deadly machinery as giveaway toys. . . . It's no happy meal," said David Orr, field director for Living Rivers, based in Moab.

Living Rivers and two dozen other environmental groups on Friday urged McDonald's CEO Jack Greenberg to remove the "thrillcraft" from the prize list.

A McDonald's spokeswoman did not return a phone call for comment. But the Pocatello, Idaho-based Blue Ribbon Coalition, which represents the off-highway vehicle industry, called the anti-McDonald's campaign "bizarre."

"This is another example of environmental extremism," said the coalition's Adena Cook.

In a letter mailed to Greenberg, Living Rivers and allies praised McDonald's for its recent efforts to become more environmentally conscious. But they chided the company for not considering the impacts of snowmobiles, ATVs and personal watercraft, such as Jet Skis.

"[These] prizes are certainly inconsistent with McDonald's stated corporate values of environmental and social responsibility," states the letter.

For the past decade, environmental groups have stepped up their campaigns against adventure vehicles, arguing they cause air, water and noise pollution, damage the land and disturb wildlife.

During the Clinton administration, the campaigns to a large degree paid off, though President Bush appears poised to reverse some of the decisions.

The National Park Service last year banned snowmobiles in most national parks, including Yellowstone. Facing a lawsuit by the snowmobile industry, the Bush administration this year put the Yellowstone ban up for further review.

The Park Service also banned personal watercraft, pending comprehensive park-by-park environmental studies. Public meetings on whether personal watercraft should be allowed at Lake Powell are scheduled this month in Arizona and Utah.

Environmentalists also have fought to restrict the use of ATVs and other off-highway vehicles in national forests and on Bureau of Land Management lands. They argue the machines tear up vegetation, cause erosion and disrupt wild animals' reproductive cycles.

In addition to pointing out the environmental consequences to McDonald's, environmental groups cite Consumer Product Safety Commission statistics showing that ATVs caused 95,000 injuries and snowmobiles sent 14,000 people to the hospital last year. Personal watercraft, they noted, account for 40 percent of boating accidents even though they account for just 10 percent of boating traffic.

Snowmobiles, ATVs and personal watercraft "may be fun to the user but they are an annoyance to nonusers. They cause injury and death and damage to the environment," Orr said.

McDonald's need not feel alone in the criticism, however. "Pepsi is offering Jet Skis, snowmobiles and ATVs as prizes too," Orr said. "We're going after them next." © Copyright 2001, The Salt Lake Tribune

Groups Target McDonald's to Halt Promotion of Polluting Jet Skis

Contact:

Katy Rexford, Bluewater Network 415.788.3666 x157

David Orr, Living Rivers 435.259.1063

MCDONALD'S PROMOTES DEADLY MACHINERY AS TOYS IN "MONOPOLY" GAME

GROUPS ASK COMPANY TO SUBSTITUTE SAFE, NON-POLLUTING
ALTERNATIVES FOR SWEEPSTAKES PRIZES

Leaders of 26 organizations representing the environment, consumer advocates, and concerned parents from across the nation blasted McDonald's Food Corporation for offering as sweepstakes prizes three of the deadliest and most environmentally harmful recreation vehicles currently on the market — snowmobiles, personal watercraft (PWC, or "jet ski"), and all-terrain vehicles (ATV). In a joint letter sent today to McDonald's CEO Jack Greenberg in Oak Brook, Illinois, 23 organizations called on the fast-food magnate to substitute safer and less environmentally-destructive products for the company's nationwide "Monopoly" sweepstakes game.

"The McDonald's Corporation promotes itself as caring about 'safe fun for children' and protecting the environment, but the Monopoly game prizes contradict those corporate values," said Katy Rexford of Bluewater Network. "We're shocked that McDonald's would offer to children prizes that are responsible for so many injuries and deaths."

According to the Consumer Product Safety Commission, ATVs alone sent over 95,000 Americans to the emergency room in 2000; snowmobiles were responsible for over 14,000 emergency room visits. Moreover, while PWCs comprise only 10 percent of the United States' recreational boating population, they are responsible for over 40 percent of injury accidents.

The National Park Service (NPS) recently agreed to ban PWCs from most national parks, and a subsequent federal court settlement agreement with NPS calls for a possible ban on PWCs at all other park units, including Lake Mead and Lake Powell on the Colorado River.

"Jetskis are unsafe and contribute to the pollution of water supplies for more than twenty million people in the Colorado River alone," said David Orr, of Living Rivers in Moab, Utah, a co-plaintiff with Bluewater Network on the NPS lawsuit. "While citizens struggle to protect their families and their drinking water from these destructive machines, McDonald's is busy serving them up as good, clean fun."

Not only do these motorized "thrillcraft" have abysmal safety records, they are bad for the environment. Almost exclusively powered by dirty two-stroke engines, these machines dump between 25 and 30 percent of their unburned fuel mixture directly into the water, or onto the land or snow over which they ride.

Joining Bluewater Network and Living Rivers in the letter to McDonald's were groups from Alaska to Virginia, including the Alaska Center for the Environment, American Canoe Association, Bay Area Wilderness Training, Boreal Footprint Project, California Wilderness Coalition, Campaign to Safeguard America's Waters, Center for Biological Diversity, Colorado Mountain Club, Friends of the River, International Marine Mammal Project, John Muir Project, Minnesotans for Responsible Recreation, Montana Wilderness Association, National Parks Conservation Association, Planning & Conservation League, Public Citizen, Schubert & Associates, Sea Turtle Restoration Project, Superior Wilderness Action Network, Swan View Coalition, Wild Wilderness, Wildlands Center for Preventing Roads, Winter Wildlands Alliance, and the Yggdrasil Institute.

In their letter, the groups expressed their desire to work with Mr. Greenberg to "change the emphasis of the Monopoly game from one of dangerous, disruptive, and disproportionately polluting motorized recreation to a wholly different set of values that respects the environment and promotes the 'safe fun for children' theme that McDonald's proudly proclaims."

- The California Air Resources Board reported that a seven-hour ride on a PWC emits the same amount of smog-forming air pollution as does driving over 100,000 miles in a typical passenger car.
- Snowmobiles in Yellowstone National Park were responsible for spewing over 90 percent of the total hydrocarbon pollution in the park, despite being outnumbered by automobiles 16 to 1. Fresh oxygen has to be pumped into the ranger station at the West Yellowstone entrance because rangers complained of nausea, headaches, and dizziness from carbon monoxide poisoning.

McDonald's Food Corporation claims to be an environmental leader, yet the message sent by these sweepstakes prizes is one of environmental dominance and destruction rather than harmony and respect.

Thrillcraft manufacturers often claim that damage and injuries caused by thrillcraft are the result of a few "bad apple" operators; however, it is the inherent design and intended use of the machines that is problematic.

Groups Seek Meeting with Interior Secretary Norton on Colorado River Delta

The Honorable Gale Norton
Secretary
U.S. Department of the Interior
1849 C Street
Washington, D.C. 20240
Dear Secretary Norton:

Thank you for your attention to Colorado River issues and for your interest in reaching out to local stakeholders to develop workable, consensus based programs. We look forward to your scheduled visit to Arizona next week and the opportunity it affords to engage in a meaningful dialogue with all Colorado River stakeholders. To that end, we respectfully request a meeting with you during your visit to discuss our interest in Colorado River management, particularly in regards to the Colorado River delta.

The Colorado River delta is of international importance, yet today the delta is facing a crisis. It has been reduced to less than ten percent of its original size due to the near total diversion of the river's flows on both sides of the border. Pressure to develop even more water for consumptive use from the Colorado River is relentless, and wildlife, freshwater fisheries, marine fisheries, bird populations, indigenous communities and the ecosystem itself are at risk.

Scientists have made preliminary estimates that the preservation process can begin with a modest amount of water -- less than one percent of the river's average annual flow. A guaranteed base flow of 32,000 acre feet per year, plus a flood flow of 260,000 acre feet every three to four years, would provide a minimal source of life sustaining water for the recently regenerated, native riparian habitat. In addition, dedication of some 100,000 acre feet of brackish agricultural wastewater would ensure the future of the Cienega de Santa Clara.

As you know, your predecessor and several basin state representatives have noted the importance of recognizing and addressing the issue of Colorado River delta restoration. Recently, representatives of the basin states, federal agencies, and the environmental community have been working together to plan a binational symposium that will provide Colorado River stakeholders with a common understanding of the Colorado River delta and its needs. This level of cooperation represents a welcome step forward, increasing communication and trust as we strive to address ecosystem needs along the lower Colorado River.

We are hopeful that, in the spirit of communication, consultation, and cooperation, all in the service of conservation you will be able to make time during your trip to Arizona next week to meet with us to discuss a consensus based approach to Colorado River delta restoration. Please contact Lisa Force of Living Rivers, at (480) 990-7839 so that we might schedule a meeting that is convenient for you.

We are sending you this request on behalf of Living Rivers, Environmental Defense, Pacific Institute, and Friends of Arizona Rivers. In addition, we would like to request a parallel meeting with you at your earliest convenience in Washington, D.C. Attached is a copy of a letter which went to Colorado River water users and agencies in March on behalf of the 133 groups, representing more than 12 million people from the United States and Mexico, who support delta restoration.

We look forward to working with you in the service of conservation.

Sincerely,

Lisa Force
Program Director
Living Rivers

On behalf of:

Jennifer Pitt, Environmental Defense
Michael Cohen, Pacific Institute
Tim Flood, Friends of Arizona Rivers

Letter to Commissioner Keys, U.S. Bureau of Reclamation

Mr. John W. Keys, III
Commissioner
United States Bureau of Reclamation
Department of Interior
1849 'C' Street, NW
Washington, DC 20240-0001
Sent via fax: 202-513-0314

July 18, 2001

Dear Commissioner Keys:

We wish to congratulate you on your recent appointment and confirmation as Commissioner of Reclamation. You have undertaken an important challenge at a difficult time for the once-powerful Bureau of Reclamation, as the agency approaches the end of its first century. June 17, 2002 will mark the centennial anniversary of the federal Reclamation Act, which led to the creation of the Reclamation Service and the dramatic transformation of the rivers and landscapes of the American West that followed.

At this moment, irrigators in New Mexico are threatening to blow up Navajo Dam on the San Juan River, while in Oregon's Klamath basin, farmers are excavating a new channel bypass around the Reclamation-owned A-Canal Dam. Never before has the agency faced such criticism and anger from the very constituents that it was founded to serve. Clearly, your job will not be easy as you struggle to balance competing demands for protecting the environment while providing subsidized water and power to irrigators, cities, and industries in the West.

Major coalitions have formed over the last year, demanding that Reclamation implement basinwide environmental impact studies to restore endangered species throughout their historic ranges, decommission major dams like Glen Canyon on the Colorado River, and restore flows to the dried-up deltas of the Colorado and Rio Grande Rivers.

This letter is an invitation to work with you and your staff to address these concerns and to help shape the Bureau's future, to reflect the changing needs of our society and the needs of the rivers themselves.

Today, more than 450 Reclamation dams and diversions stand across our Western rivers in seventeen states, creating about 350 reservoirs that provide water for 180 irrigation projects and water supply for more than 30 million people. These structures and engineering achievements, some of which are among the largest in the world, store huge amounts of water and generate over forty thousand megawatts of electric power, combined. Over nine million acres of farmland are irrigated by Reclamation projects. The scope and magnitude of the public works undertaken by Reclamation is unsurpassed in terms of the effects these projects have had on the lives of the millions of people who depend in some way on the rivers of this arid region.

Certainly many associated with the Bureau of Reclamation will find cause for celebrating the upcoming centennial. But for those committed to the sound stewardship of the rivers of the West, the sentiment is reversed. This century of impounding and diverting has brought with it extensive environmental and social problems that only worsen with time.

Western rivers are critical to the protection of the region's biological diversity. Scientists tell us that many Reclamation projects are at least partly to blame for the near-extinction of many native fish and other river-dependent species across the West. Pressure is building to take down some Reclamation dams, in order to restore rivers' ecological health and recover populations of native fish and river-dependent wildlife.

A century after its founding, the agency finds itself facing declining budgets, increasing pressure to reduce the enormous subsidies to water and power users that have fueled the engine of political support for much of the Bureau's public works. Reclamation itself has said, "the arid West essentially has been reclaimed." Yet some politicians still look to Reclamation to fulfill the elusive dream of boundless resource use. While the West may have been reclaimed, its rivers are far from functioning as ecosystems and may best be described as plumbing systems.

To that end, we submit to you a summary of the key issues we look forward to addressing with you and your staff. They reflect the growing public concern that Reclamation's actions and policies are out-of-step with the environmental constraints and social demands of this modern era.

1) **RECOGNIZE FEDERAL PRIMACY OF A PUBLIC RESOURCE:** Reclamation must recognize that the rivers under its jurisdiction are not the property of water agencies under contract, the states, or even in some cases the United States alone, but are held in trust for the benefit of the public. Uniform leadership, authority and policy must come from the Bureau. Reclamation must begin working to overhaul antiquated laws such as the Colorado River Compact that no longer reflect current realities of the region's available water supplies or public demands for habitat preservation and social equity.

2) **BASINWIDE EIS ON RIVER MANAGEMENT:** Reclamation must conduct Environmental Impact Statements (EISs) on the operations and management of dams and diversions, on each river basin, for the purpose of restoring ecosystem function, to fully recover endangered native fish species throughout their historic ranges, and to address the cumulative impacts resulting from both subsidized water and hydropower development.

3) **BUILD NO NEW DIVERSION OR DAMS:** Reclamation must focus its attention on reversing the environmental damage and social inequities brought on by its projects. Building new infrastructure will only exacerbate existing problems and conflicts. Reclamation must support de-authorization of the proposed Animas-La Plata water project in southwestern Colorado, for which no need has been identified for the water that would be diverted from the Animas River, and which is estimated to cost federal taxpayers at least a half-billion dollars.

4) **REDUCE THE NUMBER OF DAMS AND DIVERSIONS:** Reclamation must conduct regular reviews in accordance with NEPA guidelines of the operations of Bureau dams, as is required of private dams under FERC. Prepare decommissioning plans for all Bureau dams, so the public is aware of direct and indirect costs that will need to be incurred once decommissioning is technically, economically, or politically deemed necessary.

5) **UPHOLD INDIAN RIGHTS:** Reclamation must fully and fairly compensate Indian Nations for their water rights and offer attractive financial incentives for these Nations to dedicate a portion of their water for instream flows for habitat protection. Reclamation must ensure that all traditional fishing rights are restored and maintained, and that efforts are made to restore sacred sites impacted by Bureau infrastructure.

6) **ASSURE INSTREAM FLOW RIGHTS:** Reclamation must establish basinwide accounting systems that establish instream flows as beneficial uses and guarantee that water left in the rivers as a result of implementing conservation programs will not be available for appropriation by other users.

7) DELTA RESTORATION: Reclamation must allocate necessary water and sediment flows to restore and protect river deltas, with immediate action for the Colorado and Rio Grande Rivers.

8) MANDATORY WATER CONSERVATION & RECYCLING: Reclamation must mandate all users of federal water projects, regardless of water rights priority status, to meet mandated targeted reductions in water consumption, by implementing water conservation and recycling programs and promoting efficient technologies in municipal, industrial, and agricultural sectors. Reclamation must mandate shifts in cropping patterns by requiring irrigators to replace water-wasting, low-value alfalfa, hay, and other livestock feed crops grown on lands served by Reclamation irrigation contracts, with vegetable and other crops that use significantly less water per acre. Reclamation must work to revive the spirit of the Reclamation Act to support only family-owned farms with federal project water.

9) REFORM HYDROPOWER MARKETING: Reclamation must adjust subsidized rates for hydropower generated at federal dams to reflect current national-average wholesale price for electricity. Require retailers of federal power to meet mandated targeted reductions in customer consumption by implementing aggressive demand-side management and energy conservation programs, including providing low-cost loans to all ratepayers for installing their own renewable energy supply infrastructure.

10) ENFORCE ENVIRONMENTAL LAWS: Reclamation must assist in the aggressive enforcement of environmental laws including the Clean Water Act, Endangered Species Act, and other laws, to stop the point and nonpoint sources of pollution, and ensure clean-up of all known pollution sources by 2010, and recognize a right to clean drinking water for all people in the watershed.

Too many dams have been built across the over-allocated rivers of the West, and too much water is being diverted from them. Outdated laws discourage water users from conserving and stand in the way of restoring water flows to stressed streambeds. The dried-up deltas of the Colorado and Rio Grande Rivers bear silent testimony to Reclamation's failure to act as responsible stewards of the rivers it has developed.

Living Rivers looks forward to working with you to bring about the long-needed changes at the Bureau of Reclamation. We look forward to a meeting with you at your earliest convenience.

But please also understand that the rivers of the West can't survive much longer the bureaucratic inertia and neglect that has characterized Reclamation's first century. If the agency is unwilling to change, then conflicts such as those currently being played out in the Klamath Basin and the San Juan River are bound to continue. For the sake of rivers and the people and other life that depends upon them, we look forward to working with you as you face this challenge of leading the Bureau of Reclamation into its second century.

Sincerely,

Owen Lammers
Executive Director

LR Press Release 07/18/01

John W. Keys, III takes over helm of Bureau of Reclamation

Environmental groups welcome new Reclamation Commissioner, express desire to work with agency during troubled times to redirect the Bureau's mission toward restoration.

MOAB, UTAH -- Environmentalists welcomed today John W. Keys, III as Commissioner of Reclamation, expressing their desire to work with him and his agency in redirecting the mission of the US Bureau of Reclamation from development to environmental restoration.

In a letter sent today on Mr. Keys' first full day at work, the environmental group Living Rivers requested a meeting with the new Commissioner to discuss a ten-point restoration agenda for Reclamation's second century. The city of Moab, Utah is Mr. Keys' hometown, as well as Livingm Rivers' headquarters.

"We welcome Mr. Keys' appointment and look forward to working with him on critical issues affecting the rivers of the West, and ensuring that Reclamation will be admired in its second century as an agency that solved the problems of dried-up rivers and fish species going extinct," said Owen Lammers, executive director of Living Rivers. "With only 334 days left in Reclamation's first century, time is running out to address the major problems with the collapse of the elaborate plumbing systems the agency has constructed and managed."

Joining Living Rivers in the letter to Mr. Keys was the Tucson, Arizona-based Center for Biological Diversity, Salt Lake City-based Utah Environmental Congress, and the national organization Friends of the Earth.

Mr. Keys is taking the reins at Reclamation during an historical and difficult time for the once-powerful federal bureau. His confirmation comes amid reports that angry irrigators are committing vandalism at Reclamation facilities in Oregon's Klamath Basin and threatening to blow up the Navajo Dam in New Mexico.

"Protection and recovery of endangered fish and other species dependent on healthy Western rivers needs to be the number-one priority for Reclamation," said Daniel Patterson, ecologist with the Center for Biological Diversity. "Reclamation must act swiftly and decisively to stop the illegal vandalism and anti-environmental threats by irrigators, and get to work saving the species before they go extinct."

The groups noted in their letter that the agency will celebrate its centennial in 2002, and sought a meeting with the new Commissioner.

"A hundred years of dam building, canal digging, tunnel blasting, and flood irrigating have created benefits but also many problems," said Shawn Cantrell, the Seattle-based northwest director of Friends of the Earth. "Leadership is sorely needed in the federal agencies at this time to reassert federal control over Western rivers and begin dismantling fish-killing dams such as those along the Snake River."

River activists across the country are now coming together to promote major reform within the Bureau, and demanding the agency undertake basinwide studies to reveal the most effective and fastest ways to recover endangered species, restore the dying deltas of the Colorado and Rio Grande Rivers, halt construction of new dams such as Animas-La Plata in southwestern Colorado, and decommission dams such as Glen Canyon Dam on the Colorado River.

"Reclamation's engineering prowess may have been the theme of its first 100 years, but cleaning up the mess and ensuring equitable water supplies and environmental restoration must be the focus now," said Denise Boggs, executive director of the Utah Environmental Congress. "While our children will be paying for Reclamation's multibillion dollar boondoggles well into the next century, we still have a narrow window of time to fix much of the physical damage to the rivers' ecosystems."

The above organizations represent part of the rapidly growing nationwide coalition that is organizing around the agency's centennial to mobilize public awareness of the need for reform of the Bureau of Reclamation.

07/30/01

Commissioner Keys Responds

United States Department of the Interior
Bureau of Reclamation
Washington, D.C. 20240
Owen Lammers
Executive Director, Living Rivers
P.O. Box 466
Moab, UT 84532

Thanks for [your letter of July 18, 2001](#). I am indeed excited about being the 18th Commissioner of the Bureau of Reclamation. It gives me the opportunity to work with water users and water user organizations all over the West to address our many pressing water issues.

I am especially honored to be the Commissioner of Reclamation during the 100th anniversary of the passage of the Reclamation Act of 1902, which created the Bureau of Reclamation. There's much more to a centennial celebration than just looking back at what has happened over the last 100 years. We can be proud of our accomplishments over that time, but we must also look to the future to see how the Bureau of Reclamation and its facilities can best be used to help meet the resource management challenges of the next 100 years in the West.

The Bureau of Reclamation will be good stewards of our valuable land and water resources. In some cases, that means guarding our remaining free flowing rivers and streams. In other cases that means using our multi-purpose reservoirs for all of their varied intended uses. We can manage the releases of water from our reservoirs to meet multiple uses throughout its flow to the end user. Water can be used for recreation while stored in the reservoir, then for hydro power generation when it is released, for instream flows, fish and wildlife, and additional recreation while in the river, for water quality control in the river, and in the end for irrigation, municipal and industrial needs, and domestic water supply. The challenge for all of us is to manage these flows in a manner that is best for the water users, the river, and its associated ecosystem.

The Bureau of Reclamation is, and will continue to be, an agency of the future. We will remember our heritage, but we will recognize that traditional project needs must be balanced with ever increasing and changing demands for water so that we can be the best stewards of our water resources in the future.

Some of the points raised in your letter are issues that we can work on with you and your organization. Some of the points have already been addressed, and we should get on with business with the decisions that have been made. The Bureau of Reclamation will meet all the rules, regulations and laws that Congress has passed to govern our work. We will meet our contracts for water deliveries, when at all possible. We will work closely with all water users to try to find new and innovative ways to meet their needs. We will work closely with the states to comply with the water rights they administer, and,

we will work with all of the Native American Tribes to fulfill the Department of the Interior's trust responsibility to them.

With all of that said, I believe that you will see a Bureau of Reclamation for the 21st century that is well versed in collaborative and cooperative approaches to complex and contentious water problems, a Bureau with the expertise to meet the technical challenges of making those water deliveries and generating the power needed by our country, a Bureau that is environmentally sensitive, and a Bureau that is responsive to the ever changing needs of our society.

Thanks again for your intriguing letter. I hope to see you in Moab sometime in the near future. Maybe you can buy me an ice cream cone.

Sincerely,

John W. Keys, III
Commissioner

07/15/01

Centennial Reform Proposal for the Bureau of Reclamation

1) **RECOGNIZE FEDERAL PRIMACY OF A PUBLIC RESOURCE:** Reclamation must recognize that the rivers under its jurisdiction are not the property of water agencies under contract, the states, or even in some cases the United States alone, but are held in trust for the benefit of the public. Uniform leadership, authority and policy must come from the Bureau. Reclamation must begin working to overhaul antiquated laws such as the Colorado River Compact that no longer reflect current realities of the region's available water supplies or public demands for habitat preservation and social equity.

2) **BASINWIDE EIS ON RIVER MANAGEMENT:** Reclamation must conduct Environmental Impact Statements (EISs) on the operations and management of dams and diversions, on each river basin, for the purpose of restoring ecosystem function, to fully recover endangered native fish species throughout their historic ranges, and to address the cumulative impacts resulting from both subsidized water and hydropower development.

3) **BUILD NO NEW DIVERSION OR DAMS:** Reclamation must focus its attention on reversing the environmental damage and social inequities brought on by its projects. Building new infrastructure will only exacerbate existing problems and conflicts. Reclamation must support de-authorization of the proposed Animas-La Plata water project in southwestern Colorado, for which no need has been identified for the water that would be diverted from the Animas River, and which is estimated to cost federal taxpayers at least a half-billion dollars.

4) **REDUCE THE NUMBER OF DAMS AND DIVERSIONS:** Reclamation must conduct regular reviews in accordance with NEPA guidelines of the operations of Bureau dams,

as is required of private dams under FERC. Prepare decommissioning plans for all Bureau dams, so the public is aware of direct and indirect costs that will need to be incurred once decommissioning is technically, economically, or politically deemed necessary.

5) UPHOLD INDIAN RIGHTS: Reclamation must fully and fairly compensate Indian Nations for their water rights and offer attractive financial incentives for these Nations to dedicate a portion of their water for instream flows for habitat protection. Reclamation must ensure that all traditional fishing rights are restored and maintained, and that efforts are made to restore sacred sites impacted by Bureau infrastructure.

6) ASSURE INSTREAM FLOW RIGHTS: Reclamation must establish basinwide accounting systems that establish instream flows as beneficial uses and guarantee that water left in the rivers as a result of implementing conservation programs will not be available for appropriation by other users.

7) DELTA RESTORATION: Reclamation must allocate necessary water and sediment flows to restore and protect river deltas, with immediate action for the Colorado and Rio Grande Rivers.

8) MANDATORY WATER CONSERVATION & RECYCLING: Reclamation must mandate all users of federal water projects, regardless of water rights priority status, to meet mandated targeted reductions in water consumption, by implementing water conservation and recycling programs and promoting efficient technologies in municipal, industrial, and agricultural sectors. Reclamation must mandate shifts in cropping patterns by requiring irrigators to replace water-wasting, low-value alfalfa, hay, and other livestock feed crops grown on lands served by Reclamation irrigation contracts, with vegetable and other crops that use significantly less water per acre. Reclamation must work to revive the spirit of the Reclamation Act to support only family-owned farms with federal project water.

9) REFORM HYDROPOWER MARKETING: Reclamation must adjust subsidized rates for hydropower generated at federal dams to reflect current national-average wholesale price for electricity. Require retailers of federal power to meet mandated targeted reductions in customer consumption by implementing aggressive demand-side management and energy conservation programs, including providing low-cost loans to all ratepayers for installing their own renewable energy supply infrastructure.

10) ENFORCE ENVIRONMENTAL LAWS: Reclamation must assist in the aggressive enforcement of environmental laws including the Clean Water Act, Endangered Species Act, and other laws, to stop the point and nonpoint sources of pollution, and ensure clean-up of all known pollution sources by 2010, and recognize a right to clean drinking water for all people in the watershed.

LR Testimony 07/09/01

House Subcommittee on Water and Power

Written testimony submitted for the Field Hearing of the United States House of Representatives Subcommittee on Water and Power, held in Salt Lake City on Monday, July 9, 2001, on the subject of "Management of the Colorado River in the 21st Century, a Seven State Perspective"

**A CITIZENS' TEN-POINT AGENDA FOR MANAGEMENT OF THE COLORADO RIVER
IN THE TWENTY-FIRST CENTURY**

JULY 9, 2001

Honorable Jim Hansen
Chair, Resources Committee
House of Representatives
Washington, DC 20515

Mr. Chairman and Members of the Subcommittee on Water and Power:

We thank you for the opportunity to present testimony on the subject of "Management of the Colorado River for the 21st Century." We respectfully submit the following remarks on behalf of the environmental groups Living Rivers and Utah Environmental Congress.

Living Rivers, based in Moab, Utah, and Scottsdale, Arizona, is the leading advocacy group dedicated to restoring the Colorado River's natural ecosystems throughout the basin. The Utah Environmental Congress has its headquarters in Salt Lake City and focuses its work primarily on protecting Utah's national forest lands and other federally owned public lands within the state. A major priority for both our organizations is in promoting public awareness of the value of healthy rivers and watersheds.

We submit these comments for the record to register our interest and concern that the Colorado River has been managed primarily for the purpose of promoting unsustainable growth and development in the Southwest, often with little apparent regard for the ecological constraints of the river's ecosystem.

Many citizens today have grave concerns about the Colorado River and its future. Scientists tell us that the river's ecosystem in many places is in trouble or in a state of collapse. Many millions, perhaps hundreds of millions, of taxpayer dollars have been spent to date, with decidedly mixed results, attempting to mitigate environmental damage caused by Reclamation-sponsored water project throughout the river basin.

Recently a proposal was approved by the House of Representatives to begin site preparation work on a particularly irrational water project known as Animas-La Plata. The A-LP, as it is known, may be the last big-spending Reclamation project, and appears to embody some of the worst economics of any project in the agency's history. Taxpayers may end up footing the bill for much for the entire project, for which no use or need has yet been demonstrated.

A number of other problems in the river basin are acute or soon will be so. Endangered species are threatened with extinction, toxic pollutants throughout the basin threaten water quality. High evaporation rates from reservoirs such as Lake Powell and Lake Mead account for losses several times what's needed to provide significant restoration benefits for the delta.

But along with crises, important opportunities often arise. The U.S. and Mexican governments in December last year signed a diplomatic agreement--Minute 306--committing the two nations to a binational dialogue on ways of addressing the pressing question of providing flows to the delta. We strongly support this process and look forward to participating in the dialogue, which is now scheduled to begin officially in mid-September in Mexicali, Mexico. It is our hope that the Congress will be supportive of this process. It is time to look for creative solutions

Next year, 2002, will mark the Centennial of the Reclamation Act and nearly 100 years of federal role in building and operating irrigation and other water projects across the West. Recently Living Rivers led a number of groups in sending a letter to Acting Commissioner of Reclamation, Mr. William McDonald, inviting him to join us in supporting a major restructuring of the agency, toward large-scale river restoration and away from water development. We suggested renaming the agency to the "Bureau of Restoration" to reflect a shift in bureaucratic priorities.

We believe the time has come for some important decisions about the future of the Colorado River. No longer can we continue taking water out without giving something back. For three-quarters of a century, the 1922 Colorado River Compact has overallocated the river and created a system of incentives that reward water users for taking as much water as possible--instead of finding ways to conserve. Today the Colorado River has no additional water to give; the river's limited waters can only be reallocated. Present and future management of the Colorado River turns on this important point.

We call upon the United States and all the seven basin states--Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming--to come together in support of reforming both the Bureau of Reclamation and the antiquated and increasingly unworkable system of water allocations under the Colorado River Compact. The interests of diverse, river-dependent communities of people--and wildlife--must be represented and given equal consideration with other users for access to water supplies. In particular, the federal and state governments must respect and give special priority to the interests of the indigenous peoples of the US and Mexico whose water rights in many cases predate the large industrial users.

A primary goal is to make the Colorado River of the 21st century function once again as a river. Governmental officials must acknowledge that the long-term interests of the region's inhabitants cannot be served so long as the river continues to be viewed and managed as a conveyance system.

We have identified the following issues that must be addressed in the context of reprioritizing and reallocating the river's limited water supplies:

1) ONE PERCENT FOR THE DELTA: Allocate, in concert with the Republic of Mexico, at least one percent of the river's annual flow to delta restoration.

2) BASINWIDE EIS ON RIVER MANAGEMENT: Conduct an Environmental Impact Statement (EIS) on the operations and management of the Colorado River, its dams and diversions, for the purpose of restoring ecosystem function, fully recovering endangered native fish species, and addressing cumulative impacts resulting from subsidized water and hydropower development.

3) REDUCE THE NUMBER OF DAMS AND DIVERSIONS: Build no new diversions or dams on the Colorado River or its tributary streams, and prepare decommissioning plans for all federal dams in the basin, including Glen Canyon Dam.

4) COMPENSATE INDIAN WATER RIGHTS: Fully and fairly compensate Indian Nations in the Colorado River basin for their water rights and offer attractive financial incentives for Nations to dedicate a portion of their water for instream flows to the Gulf of California.

5) ASSURE INSTREAM FLOW RIGHTS: Establish a basinwide accounting system, common to all states, that establishes instream flows as a beneficial use and guarantees that water left in the rivers as a result of implementing conservation programs will not be available for appropriation by other users, and can flow undiverted to the Gulf of California.

6) MANDATORY WATER CONSERVATION & RECYCLING: Require all users of river water in the basin, regardless of water rights priority status, to implement mandatory water conservation and recycling programs to reduce overall consumption, discourage waste, and promote efficient technologies in municipal, industrial, and agricultural sectors.

7) ENFORCE CLEAN WATER LAWS: Aggressively enforce the Clean Water Act basinwide, on both point and nonpoint sources of pollution, and ensure clean-up of all known pollution sources by 2010, and recognize a right to clean drinking water for all people in the watershed, and provide state of the art water and sewer treatment facilities for all communities in the US and Mexican portions of the basin.

8) REFORM HYDROPOWER MARKETING: Adjust subsidized rates for hydropower generated at federal dams in the Colorado River basin and marketed by the Western Area Power Administration (WAPA), to reflect current national-average wholesale price for electricity, and require retailers of WAPA power to establish aggressive demand-side management and energy conservation programs, including providing low-cost loans to all ratepayers for installing solar photovoltaic units on new and existing structures.

9) CANCEL ANIMAS-LA PLATA: Deauthorize the Animas-La Plata water project in southwestern Colorado, for which no need has been identified for the water that would be diverted from the Animas River, and which is estimated to cost federal taxpayers at least a half-billion dollars.

10) REFORM IRRIGATION PROJECTS: Shift cropping patterns on participating water projects, by requiring irrigators to replace water-wasting, low-value alfalfa, hay, and other livestock feed crops grown on lands served by Reclamation irrigation contracts, with vegetable and other crops that use significantly less water per acre.

These ten policy points are not intended to be an exhaustive list of the reforms needed in Colorado River management but constitute a brief summary and representation of the need for reform. We extend an invitation to the federal and state governments to work with members of nongovernmental organizations such as ours, and the indigenous communities on both sides of the international border, to devise a workable and just solution to the pressing problems, some of which we have discussed here in this brief paper.

What we suggest can be viewed as no less than a new compact for the river--an inclusive, multilateral agreement marking a significant break from tradition. It would require a commitment by the states and the federal government to cooperate with and negotiate with a set of partners in a manner unprecedented in the history of Western water law. A dramatic proposal, and one that we submit is desperately needed by the ailing river and the communities on its banks.

Change does not come without cost, and there are some significant costs involved in making any changes to current management priorities and cleaning-up the river's problems. But as with all economic decisions, it is important to ask what will be the cost of not taking action now. Waiting until some future date when the clean-up will only be more difficult--if not impossible. We may not have the luxury of putting off these decisions much longer if we are to preserve the biological diversity and cultural uniqueness that helps define the Colorado River watershed.

Through the previous century, regional leaders tended to look at the river principally as a source of water and hydroelectric power to support industrial and economic development. Federal subsidies for water and power infrastructure made possible a development boom in the Southwest that seems at least as robust today as at any time in the last century. Each day hundreds more people take up residence in Las Vegas and Phoenix. The phenomenal migration is the direct result, from a historic standpoint, of the construction of dams on the Colorado River. Pressure is building for change, as Nevada grapples with tight supplies yet the neighboring State of Utah remains nowhere near its allocation limit.

Colorado River water is fast becoming a valuable commodity, and many predict that basinwide water marketing will by necessity become a reality, while others resist the idea. The stakes are high. Inaction may not be an option much longer. The 21st century may well see a reversal of many of the outdated policies that have in part caused the current situation. With luck and leadership, the future will be much kinder to the Colorado River and the people living along it.

We leave this discussion, however, with a caveat and a request. Nongovernmental organizations such as Living Rivers and the Utah Environmental Congress are building networks of people who are increasingly well informed on river and watershed issues,

and whose values have more in common with protecting the natural world than exploiting it. A significant demographic shift is occurring in the Southwest, one that threatens the political supremacy of the ranching, logging, and mining industries. We respectfully submit that the economic, social and cultural future of the region depends on our leaders' ability to recognize and prepare for the inevitable changes that will accompany the changing priorities of the residents.

Our organizations are working to make possible the kind of management needed to salvage the Colorado River and begin the task of restoring its ecosystem to a functional semblance of its former glory.

If we may be of assistance to the Subcommittee by providing you with information and elaboration on the points we make in this letter, please do not hesitate to contact us at the address below. The solutions to the problems we have identified can only be reached by first engaging a constructive dialogue, both regionally and nationally, about the lands and waters that make up this amazing watershed.

With your permission, Mr. Chairman, we ask that these remarks be inserted in the official record of this hearing. We are available to answer any questions the Subcommittee may have.

Sincerely,

David Orr

by Michelle Nijhuis

I step into the elevator, the doors close, and we start dropping ... and dropping ... and dropping. Our tour leader clears his throat. "My name is Mark," he announces, "and I'll be your dam" -- pause for emphasis -- "guide."

All 20 of us in the elevator laugh at the corny joke, probably because we're nervous. We're descending into Hoover Dam, the oldest concrete plug on the Colorado River and

the tallest dam in the Western hemisphere. From the inside, the thing does feel pretty dam enormous.

When we hit bottom, we extract ourselves from the elevator and tail obediently after Mark. We gape at the giant turbines, pushing back our Bureau of Reclamation-issue hardhats to get a better view. When we step outside, the dam looms above us, 726-and-a-half feet of impassive concrete. I feel about two inches tall.

The equipment is impressive, but it's the stories about the dam workers that stick in my head. The concrete, shoveled and smoothed by hand, could be stretched into a two-lane highway from San Francisco to New York. For four to five dollars a day, Mark tells us, men muscled the structure into shape, sweating their way through hundred-degree temperatures. Their wives and kids were equally tough, surviving in a scatter of shacks while they waited for company housing.

When the dam was dedicated in 1935, the dam workers and their families were national heroes. Their labors had given the nation something to be proud about, and national pride was in short supply in the 1930s. But even Mark, a dedicated dam-booster if there ever was one, hints that the story isn't as simple and heartwarming as it sounds. Though he doesn't tell the whole history, he makes it easy to piece together.

These days, the dam does provide electricity, and it stores water for sprawling Las Vegas. But neither was its primary reason for being. All that concrete was originally intended to keep the lower Colorado River from doing what it had done for eons: flood California's Imperial Valley.

Produce farmers had been thrilled to discover the valley's rich soil in the late 1800s, but the massive floods, they soon found, were inconvenient.

So they lobbied the federal government for an upstream dam, a bulwark against what they saw as the river's bad habits. Congress signed off on the Boulder Canyon Project Act and put up \$165 million -- big money in those lean days. The project eventually paid for itself through electricity sales, and the government thought it had gotten a great deal.

But the real winners were the Imperial Valley produce-barons. When the dam was completed, investors flocked south and business in the valley took off. California's desert basin still produces millions of dollars every year in artichokes, oranges and other goodies.

I am sure the men who built Hoover Dam worked hard and skillfully, and the monolith they built remains impressive. It's the dam's effects these days that I'm wondering about. When the tour ends, and I'm left standing by the highway on top of Hoover Dam, I look over the edge, fighting vertigo, and stare at the cold, clear water far below.

This dam isn't my idea of an icon. My generation didn't grow up during the Depression, and we didn't grow up desperate for a national morale boost. With the benefit of hindsight, we can see what the dam has accomplished.

There are a thousand books that tell us how Hoover spawned a plumbing system of river plugs, up and down the Colorado. There are dozens of river runners who remember how the dams destroyed magnificent canyons, and hundreds of tribal members who have seen their sacred sites disappear underwater. There are environmental activists -- lots and lots of 'em -- who can tell us about the wildlife and wild habitats that are no more. And there are the people who live downstream, in the river's delta in Mexico, who have a story to tell about a paradise wrecked.

So I'm hoping my generation can create an icon of its own. How about a Colorado River that acts in spring like a river? One that could spill floodwaters through these dams, gradually restoring native wildlife habitat from Wyoming to Mexico.

A group of young activists from the Glen Canyon Action Network want to make that kind of river real, so this spring they took their message on the road. They drove an empty water truck from Salt Lake City to Los Angeles, weaving along the course of the Colorado. They stopped in cities and towns along the way, preaching water conservation and talking about the river that could be.

They've got big dreams. But then, so did the people who built Hoover Dam.

Congressional hearing on Colorado River issues ignores citizens' input

Congressional hearing on Monday will focus on Colorado River management issues; Governors invited to testify--but not citizens
Environmental groups to offer alternative view

The US House of Representatives' Resources Subcommittee on Water and Power will hold a field hearing Monday in Salt Lake City on the topic of "Management of the Colorado River for the 21st Century: A Seven-State Perspective." Representative Jim Hansen of Utah, Chair of the House Resources Committee, is expected to preside. The hearing will be at the Utah Department of Natural Resources building, 1594 W. North Temple Avenue (corner of Redwood Road), at 9:30 AM July 9.

Subcommittee staff indicated on Thursday that the Chairman has invited the Governors of the seven Colorado River basin states to testify and give their views on Colorado

River management. The seven basin states are Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming.

Representatives of Indian Nations and citizens groups reportedly will not be permitted to testify at Monday's hearing.

Nevertheless, Living Rivers--Utah's leading advocacy group promoting Colorado River restoration--will be in attendance to offer an environmentally sound and socially equitable vision for the river. The Utah Environmental Congress and other Utah environmental organizations will be joining Living Rivers in support of healthy watersheds and river ecosystems.

"Throughout the 20th century, the government dammed, diverted, and developed the Colorado River into the world's most elaborate plumbing system," said David Orr, Field Program Director for Living Rivers. "In the 21st century, the people of Utah and the other basin states are calling for restoration of the river's ecosystem and rational allocation of the river's limited water supplies."

Current efforts to mitigate damage to the river and restore ecological function are considered to be inadequate, according to Orr. Despite the expenditure of tens of millions of federal tax dollars over more than a decade, endangered fish species recovery programs in the basin have little success to show. The Colorado River no longer reaches the sea because of diversions, and the once-productive delta is completely dry. Water allocations based on faulty, 80-year old data reward waste and inefficiency while discouraging conservation.

An environmental agenda for the Colorado River in the 21st century requires reforming the US Bureau of Reclamation, the agency most responsible for damming and diverting the rivers of the West.

"Reclamation's centennial will be celebrated in 2002," said Orr. "We call for a change of mission--from being the agency of big dams and dried-up rivers to the 'Bureau of Restoration.'"

Environmental group riled up over rainbows

By ROB BREEDING
Associate Editor
Arizona Daily Sun

The trout fishery at Lees Ferry is a freak, an anomaly caused by the construction of Glen Canyon Dam. No trout could survive the warm, silty water found in pre-dam Glen Canyon.

But since 1963 the dam has changed the river, releasing a steady current of cold, clear water that creates ideal conditions for trout. Rainbow trout stocked by the Arizona Game and Fish Department have taken hold, and Lees Ferry has developed into a blue-ribbon trout fishery with an international reputation. The Ferry has become a mecca for fly fishers, especially in the winter months when the spawning rainbows are most vulnerable to anglers.

For the last three decades, the trout fishery at Lees Ferry has generally been regarded as an asset -- an unexpected benefit of Glen Canyon Dam -- that provides recreational and economic opportunities for northern Arizona.

So it came as something of a surprise last week when Living Rivers, a Moab, Utah-based group that describes itself on its Web site as "A people's movement working to protect and restore riverine ecosystems," sent out a media advisory stating the group planned to protest the presence of rainbow trout at Lees Ferry at a pair of National Park Service scoping meetings in Flagstaff and Page.

Living Rivers would also like to see motorized boats banned from the Lees Ferry reach, and it wants public access to the tunnel near Page that provides access to the river at the base of the dam. Only Wilderness River Adventures, a commercial outfitter that runs tours down the Lees Ferry reach, now has access.

The Lees Ferry reach of the Colorado is part of the Glen Canyon National Recreation Area. Recent visitor surveys have revealed an increasing perception of conflicts between user groups. In addition, some visitors have reported concerns with crowding and a diminished quality of experience.

For these reasons, the Park Service has initiated a Recreation Management Plan for the river that will address visitors' perceptions of crowding, identify any resource conflicts, and evaluate the need for new management strategies. The overall study process is expected to extend over an 18-month period.

Stable flows in recent years have led to a boom in rainbow trout reproduction at Lees Ferry. In fact, Game and Fish hasn't stocked rainbows at Lees Ferry since 1999. Game and Fish now estimates a rainbow trout population of 250,000 to 300,000 adult fish in the 15-mile reach of Lees Ferry.

Living Rivers Field Program Director David Orr fears the trout are migrating downstream and eating juvenile humpback chub in their last Grand Canyon redoubt: at the confluence with the Little Colorado River, where the fish spawn in the warmer waters of the tributary stream, some 61 river miles downstream from Lees Ferry.

"It's likely (rainbow trout) are being pushed downstream," Orr said.

Bill Persons, a Game and Fish fisheries biologist, said past research hasn't indicated a downstream migration of rainbow trout.

From 1991 to 1997 Game and Fish stocked about 400,000 rainbow trout that were marked with wire tags at Lees Ferry. From 1992 to 1999, 2,021 downstream rainbow

trout were examined for tags and just three turned up positive. Actually, it's not even certain the three positives were Lees Ferry fish since the scanner only detected the presence of metal in the fish. The positive readings could have been broken-off fish hooks.

If the fish weren't Lees Ferry fish, then where are they coming from?

There are two trout strongholds in the Canyon closer to the Little Colorado than Lees Ferry. A concentration of rainbow trout is found near the mouth of Nankoweap Creek about 10 miles upstream from the Little Colorado River. And a population of brown trout, a more notorious fish eater, is concentrated near Bright Angel Creek about 27 miles downstream from the Little Colorado. The Bright Angel brown trout were originally stocked by the Park Service in 1923, and are now a self-sustaining population.

Last year, Game and Fish biologists collected stomach contents from 800 brown trout in the Canyon. The contents are being examined to see if they include humpback chub remains.

As for rainbow trout, the role of predation on native fish is unclear. Unlike brown trout, rainbows do not focus on eating other fish. Instead, aquatic insects and freshwater shrimp make up the bulk of their diet. But large rainbow trout will eat smaller fish.

Persons said Game and Fish might install a fish weir at the mouth of Bright Angel Creek. The weir would trap spawning trout as they move upstream. Persons said the data collected would help determine whether the Bright Angel population is spawning in the creek, or in the mainstem of the Colorado.

The results might ultimately lead to the construction of some type of fish barrier in Bright Angel that would cut off brown trout from spawning areas upstream, but that action would require an environmental analysis to be completed first, Persons said.

Humpback chub are native to the Colorado River system and are uniquely adapted to the pre-dam conditions of highly fluctuating flows in the Canyon before Glen Canyon Dam was built. In fact, some biologists speculate the unique hump of the chub is an adaptation that allows the fish to use the pressure of the current to hold its place on the bottom during high flows.

In the pre-dam Canyon, flows could range from 1,000 cubic feet per second during the winter months to torrents of 100,000 cfs or more of chocolate-colored, silt-laden runoff in the spring. Water temperatures pre-dam were just as variable, ranging from near freezing to the 80s during the summer.

Today, flows range from 5,000 cfs up to the high teens, with occasional spike flows of 30,000 cfs or more. The water pours from the dam at a steady 48 degrees.

The only remaining breeding population of chub in the canyon uses the warmer flows of the Little Colorado River to spawn. Orr fears that a major disruption of that river system, such as a chemical spill in the Little Colorado where Highway 89 crosses it near

Cameron, could wipe out the fish. Orr said that additional spawning sites for chubs were critical to the endangered fish's recovery.

Persons agreed, but said that was unlikely without significantly warming the river. And that solution comes with its own set of complications. For instance, striped bass -- native to the Atlantic Ocean and a voracious schooling predator that can reach 50 pounds or more -- are plentiful in Lake Mead below the Canyon. The frigid water in the Canyon keeps the fish downstream. Stripers are also found in Lake Powell, as are another introduced predator, smallmouth bass.

Losing the trout fishery at Lees Ferry would have an economic impact in small, northern Arizona communities like Marble Canyon. Dave Foster, whose family owns Marble Canyon Lodge, said anglers make up about 30 percent of their business. Most of the angler traffic comes during the winter, when regular tourist traffic slows down.

"Fishing picks up that slack and keeps us going through the winter months," said Foster, who also runs Marble Canyon Guides.

Foster and Lees Ferry Anglers co-owner Jeff English said they are converting their powerboats to four-stroke engines, instead of two strokes, which are noisier and create more air and water pollution. English said 13 of Lees Ferry's 15 guide boats are four strokes. Three of Foster's five guide boats run four strokes. Both recognize that two strokes will ultimately be phased out altogether.

In the absence of good evidence that Lees Ferry trout are preying on Grand Canyon humpback chub, Game and Fish will likely reject Living Rivers' call to eliminate any limits on trout at Lees Ferry (all limits for non-native fish have been lifted in the Grand Canyon) and continue its two-pronged management strategy in the Colorado River.

"We place great value, and the public places great value, on the trout fishery at Lees Ferry. We also place high value on the humpback chub in Grand Canyon. Our goal is to manage for both," said Larry Riley, Game and Fish fisheries branch chief. "I'm not sure they have to be mutually exclusive."

Hopi and Navajo protest Peabody's coal slurry pipeline

© 2001

Indian Country Today

June 27, 2001

By Brenda Norrell

Today staff

FLAGSTAFF, Ariz. - Former Hopi Chairman Ferrell Secakuku joined Navajos from Big Mountain to protest the use of aquifer water for Black Mesa coal slurry and urge creation of new, sustainable forms of energy.

"We are not always on the same side of the fence, but today we are all trying to do something on the same side of the fence," Secakuku told a crowd of American Indians and other environmentalists that included longtime resisters of Navajo relocation at Big Mountain.

"We found out the water table is being depleted," Secakuku said, denying reports by the federal government and Peabody Western Coal Co. that claimed otherwise.

Secakuku entered the offices of Black Mesa Pipeline Inc. to urge officials to halt the slurry pipeline that annually depletes 1.3 billion gallons from the Navajo Aquifer. He said using water to transport coal threatens to leave the Hopi village of Moenkopi without water in the year 2011.

"Every time you breathe, Peabody is pumping 50 gallons," Secakuku had told the crowd.

Secakuku said even though he is a Republican, Bush's energy policy, pressing to increase electricity and oil production, causes him serious concern.

Further, he said there has been no response from Interior on a proposal to provide Lake Powell water to Hopi for drinking water. He said if no alternative water source is provided by the year 2004, he and Preston would march to the Hopi Tribal Council and demand that contracts be severed, ending the slurry and coal mining on Black Mesa.

"By the year 2004, we will stop the mining."

"Soon the aquifer will crumble and no longer take the recharge."

Minutes after Secakuku entered the office, one protester outside was handcuffed, arrested and charged with blocking the sidewalk.

As the group of about 25 peaceful protesters dispersed, Flagstaff police arrived in five police cars, a police panel truck and undercover officers in unmarked vehicles.

An hour earlier, during the peaceful kickoff of the "Just and Sustainable Energy Campaign," Roberta Blackgoat, held a sign proclaiming, "The Creator is the Only One who is Going to Relocate Me," and appealed for protection of Mother Earth.

"I'm traveling for the whole universe, and the people around the globe," said Blackgoat who has spent years opposing Navajo relocation. She said coal is the liver of Mother Earth and the gouging of her liver is making the Earth sick.

"Mother Earth is really suffering. She is having a lot of pain." Appealing for future generations, she said, "I am doing this for all these unborn."

Blackgoat said money and materialism possess the peoples' mind and hearts. "The money is the most important part of the government."

Her son, Danny Blackgoat, told protesters, "With one voice we can free the globe.

We are all in a common struggle." He said corporations are draining the resources of the world. "They have been taking, taking, taking. They have never been able to give anything in return."

Urging life in harmony with nature, he countered those who say life is harsh on Big Mountain and Black Mesa. "The environment is very nurturing, you just have to know how to live with it."

Hunter Red Dog, Diné/Dakota member of Casper's 602 Band, and Tohono O'odham Tim Toro and Mike Flores were among Hopi, Navajo, Tohono O'odham and Dakota opposing coal slurry and calling for creation of alternative energy sources.

David Orr, director of field programs for Living Rivers in Moab, Utah, urged solidarity between Indigenous groups fighting for protection of Mother Earth and environmentalists struggling for restoration of the Colorado River watershed and other ecosystems.

Paul Torrence, of Arizonans for the Arctic Refuge, said proposed oil drilling in the Arctic National Wildlife Refuge threatens caribou, grizzly bears, snow geese and owls. It also threatens the culture and way of life of Gwich'in Indians.

"It would destroy the caribou herd," he said of the 129,000-member Porcupine River caribou herd.

The protest focused on Black Mesa Pipeline, which carries coal slurry from Peabody's Black Mesa Mine. Enron Corp., a major contributor to the Bush campaign, owns the pipeline. Financial disclosures last month showed Bush's White House staff owned stock in Enron.

Bucky Preston, Hopi, encouraged traditional American Indians to share their ways with others to preserve the Earth and its resources. "We need to close the mines down wherever they may be. We need to teach the whole world what we know.

"We need to do this in order to be who we are."

Flagstaff Activist Networks organized the protest with Hopis, Navajos, Sierra Club, Black Mesa Trust, Glen Canyon Action Network, Living Rivers and others. The groups urged participation in a "Lights Out! On Cheney Bush Energy Policy," a rolling national electricity blackout, June 21 from 7 to 10 p.m.

LR Press Release 06/18/01
Stop Animas-La Plata Project

CONTACT: John Weisheit or David Orr 435-259-1063

Citing Animas-La Plata Project as a "Dinosaur," groups call for investigation of project's economic and environmental problems

Environmental groups call on Reclamation Commissioner to reform agency

DURANGO, COLORADO, June 18 -- On the 99th anniversary of the passage of the federal Reclamation Act, a coalition of fifteen regional grassroots environmental, agricultural and citizens organizations sent a letter to Acting Commissioner of Reclamation J. William McDonald, calling on him to lead the Bureau of Reclamation in a new, environmentally sound direction as the agency approaches its centennial celebration next year.

*** Full text of groups' letter attached below ***

The groups also called for an investigation by the agency of apparent economic improprieties and environmental damage caused by the recently authorized Animas-La Plata (A-LP) project in southwestern Colorado and northwestern New Mexico. The Bush Administration recently recommended a multimillion-dollar appropriation for the project that would divert large amounts of water from the Animas River into a proposed off-stream reservoir near Durango.

The letter is the first in a series that will highlight outdated and environmentally harmful programs and activities of the Bureau of Reclamation, the groups said.

"As we near the end of a century of Reclamation's public works, we look around us and see dams, ditches, and dewatered rivers across the West," said John Weisheit, Conservation Director of Living Rivers, based in Moab, Utah. "The agency has to turn around and begin restoring the natural beauty and ecological functioning of the rivers of the West."

Environmental groups from around the Four Corners region joining with Living Rivers in signing the letter to Acting Commissioner McDonald include: Animas River Agriculture Irrigators Association, Cedar Hill Clean Water Coalition, Citizens Progressive Alliance, Colorado Public Interest Research Group, electors Concerned about Animas Water, Forest Conservation Council, Forest Guardians, Four Corners Action Coalition, Friends of the Animas River, Glen Canyon Action Network, San Juan Audubon Society, San Juan Citizens Alliance, Sheep Mountain Alliance, and Taxpayers for the Animas River.

"The Animas-La Plata project is a dinosaur," said Philip Doe, chairman of the Citizens Progressive Alliance and a retired policy officer with the Bureau of Reclamation. "The bad planning, bad economics, and lack of concern for the environment that characterize this half-billion dollar boondoggle should move the Bureau and Congress to conduct a full investigation before a single yard of dirt is ever moved."

In their letter, the groups cited the apparent lack of uses or need for the Animas River water to be diverted by the proposed A-LP project. The withdrawal of significant amounts of water from the river will adversely affect recovery of endangered fish species in the San Juan River, downstream of the project. The Animas is one of the last free-flowing rivers in the region.

"The A-LP is just another big government pork-barrel, only worse," said Weisheit. "We hope the Commissioner will agree that Reclamation's reputation and future are on the line with this project."

The groups' letter represents the beginning of a grassroots movement to reform the Bureau of Reclamation.

----- - TEXT OF GROUPS' LETTER - -----

Mr. J. William McDonald Acting Commissioner US Bureau of Reclamation Department of Interior 1849 'C' Street, NW Washington, DC 20240-0001

sent via fax: 202-513-0314

June 18, 2001

Dear Commissioner McDonald:

This week marks the ninety-ninth anniversary of the passage of the federal Reclamation Act, and the creation of the Reclamation Service, later to become known as the Bureau of Reclamation. One year from now—June 17, 2002—will mark the centennial of the law that led to a dramatic transformation of the rivers and landscapes of the American West.

This letter is a request for action. The many pressing problems besetting the rivers of this region deserve the full attention of the Bureau of Reclamation. Our fifteen environmental, agricultural and citizens organizations, listed below, respectfully request your personal intervention and commitment to changing Reclamation's priorities to reflect the changing needs of our society, and the needs of the rivers themselves.

Today more than 450 Reclamation dams and diversions stand across our Western rivers in seventeen states, creating about 350 reservoirs that provide water for 180 irrigation projects and water supply for more than 30 million people. These structures and engineering achievements, some of which are among the largest in the world, store huge amounts of water and generate over forty thousand megawatts of electric power, combined. Over nine million acres of farmland are irrigated by Reclamation projects. The scope and magnitude of the public works undertaken by Reclamation is unsurpassed in terms of the effects these projects have had on the lives of the millions of people who depend in some way on the rivers of this arid region.

Certainly many associated with the Bureau of Reclamation will find cause for celebrating the upcoming centennial. But for those committed to the sound stewardship of the Colorado and other rivers of the West, the sentiment is reversed. This century of impounding and diverting has brought with it extensive environmental and social problems that continue to worsen. Western rivers are critical to the protection of biological diversity in this arid region. Scientists tell us that many Reclamation projects are at least partly to blame for the near-extinction of many native fish and other river-dependent species across the West. Pressure is building to take down Reclamation dams in some places, to restore rivers' ecological health, and recover populations of native fish and river-dependent wildlife.

The organizations listed below join together in marking the culmination of this "Reclamation Century," by calling on the Bureau of Reclamation to acknowledge the harm that its projects have often caused, and dedicate itself to making river restoration, not exploitation, the agency's focus in the years ahead.

A century later, the agency finds itself facing declining budgets, increasing pressure to reduce the subsidies to water users that have fueled the engine of political support for much of the Bureau's public works. Reclamation itself has said, "the arid West essentially has been reclaimed." Yet some politicians still look to Reclamation to fulfill the elusive dream of boundless resource use.

To that end, we come to the first point of grave concern to which we wish to draw your attention: the Animas-La Plata (A-LP) Project in southwestern Colorado. This environmentally destructive scheme is an economic boondoggle that will cost federal taxpayers hundreds of millions of dollars with few benefits. Environmental advocates and others have been engaged for more than a decade in an effort to protect the Animas River from this dinosaur project.

A brief summary of the problems with the A-LP reveals an unsettling picture. If it were built, the project would:

- o Divert one of the region's last free-flowing rivers, and inundate a productive refuge for wildlife at a cost of \$340 million dollars or more;
- o Reduce flows in an already heavily depleted San Juan River system, placing additional pressure on the endangered native fish and other river-dependent species in the basin; and
- o Provide taxpayer-subsidized water for as-yet unidentified and unneeded development projects, only adding to the Bureau's "pork-barrel" legacy.

Therefore:

We the undersigned citizen groups call on you to recognize the seriousness of the Animas River's plight, and we ask you to seek funding from the Administration and the Congress to prepare a report investigating the environmental and economic concerns that have been raised by citizen groups about the project. We ask that you oppose appropriating any funding for project construction pending the outcome of these studies.

We also ask that you consider Reclamation's future direction, and the benefits of shifting the agency's mission from development to restoration. Return the agency to its roots as a supporter of small family farms, not a subsidizer of globalized corporate agribusiness. Add an essential component to Reclamation's mission--to become a protector and defender of the environmental quality and health of river ecosystems.

Over the coming year, our organizations will be communicating with you on a regular basis about a number of other issues and concerns that warrant corrective action by your agency.

The policies that govern Reclamation's actions, as well as those set by the Bureau itself, are out-of-step with the environmental constraints and social demands of this modern era. Too many dams have been built across the over-allocated rivers of the West, and too much water is being diverted from them. Outdated laws discourage water users from conserving, and stand in the way of restoring water flows to stressed streambeds. The dried-up Colorado River delta in Mexico bears silent testimony to Reclamation's failure to steward properly the rivers it has developed.

Our organizations look forward to working with you to bring about long-needed changes at the Bureau of Reclamation. In the coming year, we will be sharing more of our concerns with you in the spirit of a frank and open dialogue. Please feel free to call upon us for consultation at any time. But please also understand that the rivers of the West can't survive much longer the bureaucratic inertia and neglect that has characterized Reclamation's first century. If the agency is unwilling to change, then we will feel compelled to work in a more adversarial mode to impose change on the agency, for the sake of rivers and the people and other life that depends upon them.

Sincerely,

John Weisheit Conservation Director Living Rivers Moab, Utah

Activists Want Uranium Plant Closed

White Mesa mill near Blanding is compared to troublesome Atlas site

The Salt Lake Tribune
Sunday, June 3, 2001

By Lisa Church, Special to the Tribune

MOAB - Some environmentalist groups say the White Mesa uranium mill near Blanding should be closed before the state has another contaminated tailings site on its hands similar to the Atlas site north of Moab.

Representatives of the Utah Sierra Club Glen Canyon Group and Living Rivers, both based in Moab, made their remarks during a public comment period to the state's Radiation Control Board, the oversight board for the Division of Radiation Control, during a meeting in Moab on Friday.

The White Mesa Mill, in San Juan County, is owned by International Uranium Corp. It uses an acid-leach process to extract uranium and other valuable metals from radioactive waste shipped to the site from around the country. The remaining materials are disposed of in the mill's tailings site. A \$10 million bond is in place for reclamation, should the site close, but residents say that is not enough money to pay for cleaning the site.

On Friday, the environmentalists described the waste disposal area as being similar to the 13 million tons of tailings produced by Atlas Corp., which processed uranium as a site near the banks of the Colorado River and has been a source of headaches for the state and federal agencies since the company closed its plant in 1984 and filed for bankruptcy protection in 1998. After 10 years and millions of dollars in studies and stabilization work, the Atlas site will be turned over to the U.S. Department of Energy in September.

Environmentalists told Radiation Control Board members the White Mesa Mill is a toxic waste dump, accepting materials that will produce little uranium or valuable metals. They said the mill also could pollute the underground aquifer that is the water source for the Ute Reservation, and said the aquifer would then carry the toxins into the San Juan River which joins the Colorado River at Lake Powell.

"This is a huge watershed that feeds the entire West," said John Weisheit, chairman of the Glen Canyon Group of the Sierra Club. "I'm disappointed in the leadership of Utah. We don't want nuclear waste here."

Sierra Club member and longtime environmental activist Ken Sleight urged the board to close the White Mesa mill, which earlier this year applied to the federal Nuclear Regulatory Commission for a license to transport and process radioactive lead waste from a site in California.

Owen Lammers, executive director of Living Rivers, told board members the International Uranium, which has operated the mill located on the Ute Reservation south of Blanding since 1980, is not financially stable. He cited figures from the company's 2000 annual report filed with the federal Securities Exchange Commission, which show that the company's assets have dropped from \$32 million in 1998, to \$6 million last year. "We have a situation where the company is declining. They're having trouble," Lammers said.

Urging the state to "investigate independently" how much reclamation of the White Mesa site will cost, Lammers cautioned board members to carefully review the financial disclosures in the company's annual report.

International Uranium president Ron Hochstein, who attended Friday's meeting, said the company is financially secure and stressed that White Mesa is a working mill, not a toxic dump.

He said the company's annual report shows lower assets because the value on mining properties the company owns had declined in recent years due to a drop in the price of uranium.

Barely a river

Stories by Mitch Tobin and photos by Jeffry Scott

ARIZONA DAILY STAR

The "Cucapah" sits in the sun-baked flats of the Colorado River delta about 40-miles south of San Luis Rio Colorado, Mexico. The river that carved the Grand Canyon is barely a trickle this far south and what water there is here is primarily from the Sea of Cortez.

Pressure is on U.S. to help revive Mexico's Colorado Delta

Their dream is to pull endangered species back from the brink, stimulate marine life in the Gulf of California and rejuvenate a landscape that was once a tropical swamp prowled by jaguars and bears.

Today, the 3,000-square-mile delta offers only hints of its former self.

The upstream damming of the Colorado, and its diversion to places including Tucson, has caused stark and sterile salt flats to replace most of the marshes and forests. In dry years, a river once mighty enough to sculpt the Grand Canyon and flip a 36-ton steamboat doesn't even reach the sea.

Recent wet years, however, have let more fresh water reach the delta, spawning patches of new habitat and bumper harvests of fish and shrimp. It's proof that the delta could be revived if it could only get a little more water from upstream users such as Arizona, some advocates and University of Arizona researchers say, End of a River

'There's plenty of water. The thing is, we abuse it.' Lisa Force, director of Living Rivers

One month ago, Tucson became the latest city to tap the Colorado when it began using its allocation from the \$4 billion Central Arizona Project.

In total, the Tucson area has rights to about 1 percent of the Colorado's flow - the amount some conservation groups want to see dedicated to ecological purposes in Mexico.

If the delta's backers succeed, Tucson and the rest of the Colorado's users could be forced to give up some of their precious water supply.

But the campaign to send heavier flows down the river faces a steep, uphill climb. And the trickle that arrives in the delta today might not be there tomorrow.

Upriver from the delta, an era of civil engineering that rivaled Egypt's pyramid building has turned the Colorado into an elaborate plumbing system that provides drinking water for 25 million Americans and irrigation for some of the world's most productive farmland.

Every drop of the Southwest's biggest river is already accounted for. And in the nation's fastest-growing region, no one is rushing to give up his share.

"There's a shortage of water in the system already, and both California and Nevada need more," noted LeGrand Nielson, deputy director of the Bureau of Reclamation, which led the last century's dam-building crusade.

Environmentalists on both sides of the border have sued the Bureau of Reclamation several times in the past year, claiming the agency is violating the Endangered Species Act by depriving the delta of water. Federal officials respond that the U.S. law doesn't apply in Mexico.

Even so, the recent litigation marks an unprecedented focus of attention on an inhospitable region that has been a blind spot for most Americans.

With summer temperatures topping 120 degrees and 3 inches of rain falling in a good year, the delta remains one of North America's most forbidding places. Humidity from the sea and irrigated fields, mosquitoes from standing water and the abject poverty of farm workers' shantytowns hardly beckon visitors.

The delta may never become a hot spot for tourists. But even some of the Colorado's most prominent water users are starting to acknowledge its needs. When activists on a "One Percent for the Delta" road trip arrived in Las Vegas in March, the city's top water official, Patricia Mulroy, told them the delta is "an issue whose time has come."

Author Marc Reisner, in his 1986 book "Cadillac Desert," saw the Colorado's transformation as a metaphor for our time: "One could say that the age of great expectations was inaugurated at Hoover Dam - a fifty-year flowering of hopes when all things appeared possible. And one could say that amid the salt-encrusted sands of the river's dried-up delta, we began to founder on the Era of Limits."

Colorado River is farmer's lifeblood

Stories by Mitch Tobin and photos by Jeffry Scott
ARIZONA DAILY STAR

Ramon Alvarado Garcia grows grass for cattle feed in a ditch beside the canal carrying the river's remnants.

For Evanisto Beltronas, 74, the damming and diversion of the Colorado has been a good thing. At high noon, in a cotton field 20 miles south of Yuma, with the temperature climbing toward 105 degrees, the Mexican farmer said an aqueduct from the Colorado has made his life easier.

"When the river was still here, there wasn't a road, there wasn't electricity, there wasn't anything," he said.

Beltronas makes 80 pesos for a six-hour shift on someone else's land - about \$1.25 an hour. At the end of his day he crosses a canal choked with algae and disappears into a village of crude shacks.

A 1944 treaty guarantees Mexico about 10 percent of the river's flow. Most of that water is diverted to farmland by a concrete river that starts at Morelos Dam west of Yuma; the rest goes to the booming border cities of Mexicali and Tijuana, which are growing at more than 3 percent annually.

For farmers north of the border, harnessing the Colorado's flow has allowed them to exist in the continent's driest region. The dams have also provided hydroelectric power and reduced the threat of deadly flooding. To some, river water that reaches the sea is still "wasted."

California's Imperial Irrigation District, which uses about 20 percent of the Colorado's flow, harvests a half-million acres and produces \$1 billion in crops each year. It is politically powerful enough to stand toe-to-toe with the cities of Southern California, which desperately want farmers' water for their growing populations.

Although cities in the Southwest are drawing an increasing amount from the Colorado, farms still account for 72 percent of the river's use. Some of that water grows produce and cotton; most irrigates cattle feed.

As a result, environmental groups argue that slight improvements in farms' water efficiency - using drip irrigation instead of flooding fields, for example - could create enough surplus water for the delta.

"There's plenty of water. The thing is, we abuse it," said Lisa Force, director of the Moab, Utah-based Living Rivers.

Because it takes 3,200 gallons of water to create enough feed for 1 pound of beef, Force says, if everyone dependent on the Colorado skipped just one half-pound burger per year, there would be enough for the delta. The same gains would result from each of those people conserving 3 gallons per day.

"We're not preaching vegetarianism or veganism," she said. "We just want to make little notches in the extreme extravagance with how we treat water."

But Imperial Irrigation District spokeswoman Susan Giller said the district has already lined nearly all of its canals to prevent seepage and has become one of California's most efficient agricultural areas.

"The more efficient you become, the more complicated and expensive it becomes to save water," she said.

Drip irrigation isn't practical for crops such as alfalfa because the plants are harvested several times a year and the tubes would be ripped up, she said.

The Imperial Valley also must frequently flush salts from the soil because the Colorado's naturally high mineral content gets even more salty by repeated irrigation upstream.

"If you cut production here," Giller said, "that means your food will cost more."

But even if U.S. water users agree to give up water for the delta, skeptics argue that Mexican farmers would intercept it as soon as it crosses the border.

That's why the delta's boosters say a binational pact would be essential. Such a deal would likely pass through the International Boundary and Water Commission, which regulates U.S.-Mexican water issues.

Tucsonan John Bernal was the commission's U.S. representative for the past six years, and one of his last acts in office in December was signing an agreement with Mexico to start working on solutions for the delta.

But with new leaders in both countries, it's unclear what will happen, Bernal said.

Others note that as the upstream user, the United States has absolute leverage to prevent Mexico from reneging on an agreement.

"We've got our hand on the faucet," said Stuart Hurlbert, a San Diego State University biologist who has led field trips to the delta since 1978.

Accidental marsh unveils past

Dream vs. reality Once, much of the 3,000 square-mile Colorado River delta looked like this remnant, the 12,000-acre cattail marsh known as Cienega de Santa Clara.

Visitors can still glimpse the delta's pre-dam appearance at the Cienega de Santa Clara. Located 50 miles southwest of Yuma, the 12,000-acre cattail marsh is an oxymoron - the Sonoran Desert's largest wetland.

Nearly 300 bird species - including thousands of endangered Yuma clapper rails - visit or live in the cienega's hissing reeds. Its olive, brackish waters are also home to the endangered desert pupfish.

The cienega's existence is an accident. It was supposed to be the dumping grounds for brine coming from the Bureau of Reclamation's Yuma desalination plant. But that \$250 million facility, meant to reduce the salinity of Colorado River water the United States must deliver to Mexico, operated only for a few months in 1993 and is now in mothballs.

So, instead of the dregs of desalination, the canal from the plant now transports 325 billion gallons of agricultural runoff from Arizona's Wellton-Mohawk farming area each year.

"This water is too brackish for agriculture, so that's why it's here. Nobody wants it," said Jose Campoy, manager of the national preserve that includes the cienega.

The desalting plant's brine would have killed the cienega and made it as biologically poor as thousands of acres of dusty plains surrounding it - pampas cracked like sunbaked skin and coated with a frosting of salt.

Instead, the cienega resembles the green lagoons that ecologist Aldo Leopold wrote about - a poetic description of the delta's shifting landscape that advocates rarely fail to cite.

Leopold, whose blending of ethics and aesthetics has become the intellectual fountainhead for many American Greens, explored the delta by canoe with his brother in 1922, roasting quail over mesquite fires and climbing cottonwoods to scout the river's path.

"The river was nowhere and everywhere, for he could not decide which of a hundred green lagoons offered the most pleasant and least speedy path to the Gulf," Leopold wrote. "So he traveled them all, and so did we."

In the pre-dam days, Leopold recorded clouds of waterfowl, families of raccoons munching on water beetles and bobcats fishing for mullet. Though he never spotted a jaguar - el tigre - he said its "personality pervaded the wilderness."

The several million acres of wilderness that Leopold traveled through have shrunk to about 150,000 acres, according to UA scientist Ed Glenn, whose research on the delta has become exhibit A in environmentalists' case for sending more water there.

Glenn's study of the cienega and the sprouting of cottonwood-willow forests along the river's main stem after flooding in the 1980s and 1990s has led him to believe that a small, steady flow from the Colorado with surges every four or five years could do wonders for the area's ecology.

But before advocates see the delta's native vegetation spread, they might be fighting to preserve what little remains.

Flooding that has regenerated parts of the delta isn't guaranteed to continue. A drought in the Colorado's 244,000-square-mile basin could snatch back gains made in the past 20 years.

While the Yuma desalination plant is now dormant, it advertises "water for sale" on its Web site, www.yao.lc.usbr.gov/ydp5.htm.

Bureau of Reclamation Deputy Director LeGrand Nielson said the agency is "dead serious" about meeting its water obligations to Mexico without operating the plant. And the agency has begun the first "baby steps" in searching for other water sources for the delta, he said.

One idea is to "bank" river water in Arizona's aquifers during flood years. In droughts, Arizona would then use that stored water in exchange for giving up some of its Colorado allocation for the delta.

Another proposal would help Mexican farmers pump salty ground water that hurts their crops and send it to the delta.

"If people can just be patient and stay at the table, we can do something here," Nielson said.

Tribe suffers with delta

The delta is a fickle place.

Erratic flows from the Colorado, and the ebb and flow of the gulf's tides change conditions from hour to hour, season to season and year to year.

The dynamic process is most obvious in the intertidal zone, the 30- to 40-mile stretch of the river's main channel where the coming and going of the sea creates shifting zones of salinity.

It is in these traditional fishing grounds of the Cucapá Indians where the delta's mighty "tidal bore" once reigned. The collision of the incoming sea water and the outgoing river would create a wall of water that sometimes topped 15 feet and migrated with the tides.

In 1922, not long after Aldo Leopold visited, the tidal bore - el burro to Mexicans - killed 86 peasants from Guaymas when it rolled the 36-ton steamer Topolobampo. Only 21 bodies were found, and just 39 passengers survived.

"Days later they were still being dragged out from the mud flats nude, half insane from thirst, blistered by the sun and raw from predatory swarms of insects," wrote Frank Waters in his 1944 book, "The Colorado."

Today, with el burro tamed by upstream dams, Cucapá fishermen worry more about the simple lack of fish. A tribe that once flourished now struggles to find enough to eat.

Like the Tohono O'odham near Tucson, the Cucapá are divided by the international border. Near Yuma they run a casino, but the benefits don't appear to have trickled down to tribal members in Mexico.

"The river here used to have lots of water. We could drink from it, not >from bottles," recalled Inocencia Gonzalez, 65, one of the tribe's leaders. "There also used to be lots of fish. Now there are hardly any."

The Cucapá have fishing rights to Laguna Salada, a brackish lake 30 miles southeast of Mexicali that was once so productive it was said to "boil" with fish. The Colorado used to feed Laguna Salada, but today the lake is mostly dry and devoid of life.

A century ago, the Cucapá numbered in the thousands, but the tribe has dwindled due to assimilation, intermarriage and the decline of a lifestyle dependent on the river.

"They used to be a thriving, dynamic community. Now it's just a few hundred people hanging on," said Mark Briggs, conservation director of the Tucson-based Sonoran Institute.

Javier Mosqueda, president of a 2-year-old advocacy group of delta residents, said Mexico continues to suffer from the unfair division of the Colorado.

"The laws seem to be working for the people up there in the U.S., but for the people down here, they aren't," he said.

He said the delta's situation won't improve without cross-border cooperation.

"The water doesn't belong to the people of the U.S. or Mexico," he said. "It belongs to the river."

Mud flats are gulf's nursery

On islands north of San Felipe, shells are exposed as far as the eye can see. Erosion by gulf waters and lack of Colorado River sediment lay them bare.

For millions of years, the Colorado's surging spring snowmelt carved the Grand Canyon and countless other chasms. The river then transported 70 percent of that sediment hundreds of miles to the delta, where it fanned out in the northern Gulf of California.

Today, tides that vary as much as 25 feet in a day expose the delta's innards in mile-wide mud flats that are rippled with hallucinatory patterns from the receding and advancing sea. The spongy, chocolate-colored mud is literally crawling with snails, crabs and worms.

These invertebrate species near the bottom of the area's food chain nourish fish, stingrays and scores of bird species.

University of Arizona scientist Ed Glenn examined the records of shrimp fishermen from San Felipe, on the Baja California Peninsula, and concluded that the year following floods, their harvest doubled or tripled. Catches of corvina, once thought to be "fished out," rebounded tenfold after the delta got more water.

Some scientists suggest the Colorado supplies valuable nutrients to the upper gulf. Glenn, however, believes the river mainly helps marine life by discouraging predator fish from entering the Colorado's final stretch, which serves as a refuge for shrimp larvae and corvina fry.

Many biologists also think that healthier flows of fresh water to the gulf would have a cascading, positive effect on the gulf's other marine species, including the vaquita, an endangered porpoise.

San Felipe fishermen such as Arnaldo Espinoza Solano also thinks more river water would help.

"When there's more water in the river, it's more productive," said Solano, 35, who estimated unemployment in the area at 30 percent.

Born to the south in Sinaloa, Solano moved north to San Felipe six years ago to look for work. This summer, he'll be going north again, visiting a relative in Phoenix, working as a cook in a seafood restaurant and maybe staying in the United States.

"El agua es la vida," Solano said as he stared out at the sea.

Water is life.

FOR IMMEDIATE RELEASE

APRIL 13, 2001

NATIONAL PARK SERVICE BANS JET SKIS AT LAKE POWELL, LAKE MEAD, BY
2002

GROUPS HAIL VICTORY, QUESTION NEED FOR ANTELOPE POINT MARINA

MOAB, UTAH -- On Thursday, a federal district court judge in Washington, DC, approved a settlement agreement between environmental groups and the National Park Service (NPS), requiring NPS to prohibit the use of personal watercraft (PWCs), also known as jet skis, on all federal park units nationwide by Fall 2002. The ban applies to the reservoirs at Glen Canyon (Lake Powell) National Recreation Area, near Page, Arizona, and Lake Mead National Recreation Area, near Las Vegas, Nevada.

Under terms of the settlement, the only exception would be in cases where the agency could prove that the machines do not cause harm to the environment on a given reservoir.

"This agreement is a victory for public safety and environmental protection," said David Orr, Director of Field Programs for Glen Canyon Action Network (GCAN), a plaintiff in the lawsuit. "Jet skis don't belong in our national parks, period."

The PWC ban should lead to a significant reduction in water pollution and unsafe recreational activities on the reservoirs. Concerns about public safety and environmental impacts of PWCs have never been higher.

On April 9, for example, a fatality occurred at Lake Mead Reservoir when two jetskiers collided head-on at high speeds.

PWCs are recognized by the US EPA as responsible for dumping large amounts of petroleum and other chemicals into waterbodies where the machines are used. The impact of PWC pollution on drinking water resources is well documented. The Lake Powell and Lake Mead reservoirs are part of the Colorado River plumbing system that provides drinking water for more than twenty million people.

At a time when NPS should be working to reduce the heavy impact of PWCs and other motorized watercraft, the agency is promoting increased use.

For example, environmental groups are questioning the proposed Antelope Point Marina project on Lake Powell Reservoir. GCAN is working in coalition with other leading environmental and Native American groups in the region, to contest the development. Concerns have been raised over increased watercraft usage, water quality degradation, and more damage to natural and cultural resources in the vicinity.

"We are working to save our sacred sites and protect our cultural heritage," said Thomas Morris, Jr., of Window Rock, Arizona, and President of the Diné Medicinemens Association, one of the groups protesting the marina. "The waters themselves are sacred."

While Native Americans and environmentalists celebrated their victory, PWC industry trade groups, the Personal Watercraft Industry Association and the American Watercraft Association, were not so happy. The court decision handed them a stunning defeat when their motion to intervene in the case was denied. In a strongly worded order, the judge ruled that the PWC industry's interests would not be injured by the terms of the settlement and therefore the industry had no standing to intervene in this matter. The nine page order also stated that some of the industry's claims bordered on the "frivolous."

For additional information on the lawsuit, or on two-stroke motors in general, please visit the website of Bluewater Network, a co-plaintiff in the case: www.bluewaternetwork.org/

For information on the Antelope Point Marina project, please visit GCAN's website: www.drainit.org/

Epilogue as Prologue...Sustainable Water Project Tour

It was dark when we finally arrived at the point of the Colorado River's passage into Mexico, just below Morelos Dam amidst flat farmlands near Yuma, Arizona on March 15th. We'd traveled 2,800 miles along portions of the river's main stem as well as its primary tributaries: the Green, San Juan and Gila rivers.

Our craft was not a boat, as was used by John Wesley Powell and earlier explorers, but a 4,000-gallon water tanker truck. Nor was our mission one of natural discovery, but one of building social awareness for the watershed's restoration, especially its dying delta that begins just downstream. We had come to deliver back to the river the water that we had collected on our 11-day journey — water which under more natural conditions would flow down the river to replenish the delta and the Gulf of California.

Today however, the river's flow is diverted entirely through the Colorado's vast plumbing system of dams, reservoirs, pipelines and tunnels. Our truck's payload would represent less than one billionth the amount of water that historically flowed past this point each year. Yet, given the river's present state, our contribution felt more than symbolic. The night's darkness could not mask the river's pain: just a trickle meandered through the channel. Behind the thin veneer of vegetation, the river's shriveled self appeared little different from the hundreds of irrigation ditches we passed earlier that day. It was difficult to distinguish at first between nearby ditches and the river.

The large main canals near Yuma, in contrast, carry far more of the river's flow than the river itself. A collection of lawn hoses from a Las Vegas suburb seemed capable of dispensing more water than what flowed past us there on the banks of this once-mighty river. We stood at the international boundary, representing a coalition of 122 organizations and twelve million people from the United States and Mexico who want water to reach the delta once again. This tour marked the founding of the largest and broadest-based movement yet to call for Colorado River restoration. Just one percent of the river's average annual flow is all we ask of water agencies. We want them to agree to leave this tiny amount in the river so that the eight percent of the original delta that still remains can at least be kept on life support.

We held rallies, teach-ins and organizing meetings during our Sustainable Water Project Tour. We hand-delivered letters on behalf of the coalition to water agencies requesting their one percent contribution. We generated television, radio and newspaper coverage for the river and delta. Along the way, our truck rolled down the highways and through the communities of the Colorado River watershed, collecting water "donations" from reservoirs, municipal water systems, and irrigation ditches. But as our journal illustrates, it's not just the delta that's suffering.

Major stretches of the basin's rivers and riverine habitat are also in peril. Colorado River water misuse and abuse is needlessly killing one of North America's most geologically, biologically and culturally diverse river systems. Our delivery to the delta that night

carried with it the spirit of people living in towns, cities and rural communities across the region and beyond, who are united in their commitment to preserving and restoring the river and its watershed. The launching of the "1% for the Delta" campaign is the latest effort to make this happen.

Media Advisory 03/13/01

Los Angeles Rally--International Day of Action for River Restoration

"Sustainable Water Project Tour" Asks for Water for the Colorado River Delta

CONTACT: Owen Lammers, mobile 435.260.2590, 260.2591; message 435.259.1063

Lisa Force, mobile 602.321.1753

Tuesday, March 14, 2001 Noon-1:30 PM Olvera Street Plaza, downtown Los Angeles

Los Angeles environmental organizations will rally on Wednesday to welcome the "Sustainable Water Project Tour" when it rolls into the city on the tenth day of a roadshow across the Southwest. Representing more than 120 advocacy groups and twelve million people in the U.S. and Mexico, the tour will bring a water tanker truck to the headquarters of the Metropolitan Water District of Southern California (MWD), symbolically seeking donations of water for the Colorado River's dying delta.

A rally will be held at noon at the Old Pueblo Plaza on Olvera Street, sponsored by Southern California's leading environmental and river advocacy groups, including Action Resource Center-Los Angeles, Angeles Chapter of Sierra Club, California EarthCorps, Friends of the Los Angeles River, and Wetlands Action Network.

Following the Olvera Street rally, marchers will walk one mile to the Los Angeles River at the historic "Cornfields" on Main Street in Chinatown, the location of one of the earliest irrigated farms in California. The march will highlight efforts to save this site from development and protect it as parkland.

Wednesday, March 14, is the Fourth International Day of Action for Rivers and is being celebrated in over 50 actions in 28 countries around the world. The Sustainable Water Project Tour is one of the largest such actions and is promoting river restoration through water conservation in the Southwest. The tour is sponsored by Living Rivers of Phoenix, Arizona, and Glen Canyon Action Network of Moab, Utah.

Gathering at the Olvera Street bandstand, the groups will call on water agencies to take action to restore the river. They will deliver a letter to the MWD, the largest municipal user of Colorado River water, asking the agency to give back one percent of its current Colorado River usage for ecological restoration. Numerous endangered species, including the vaquita porpoise--the world's smallest and rarest marine mammal--depend on the river and its delta for survival.

"Over 90 percent of California's wetlands and the Colorado River delta's wetlands have been destroyed," said Marcia Hanscom, executive director of Wetlands Action Network. "It's time we start leaving water in the rivers to help get back these wetland systems--

which historically serve as critical stopover habitat for hundreds of species of birds navigating the Pacific Flyway,".

If one-third of the 15 million California residents who are plumbed into the Colorado River's water supply system were to bring their communities' water consumption down to the national average of 101 gallons per day, that alone would be enough water to begin the delta restoration process.

"We must work towards sustainable use of our rivers and watershed," said Zhetonia Tiluso, RiverWatch Coordinator for Friends of the Los Angeles River, the leading organization supporting restoration of the river throughout its length. "It's time to give back to the Earth the life force she gives to us."

Friends of the L.A. River is currently working to establish a park at the Cornfields, the termination point of Wednesday's rally and march.

Other Southern California groups cosponsoring the event include: Access for All, Christians Caring for Creation, Center for Biological Diversity, EcoLinks, El Dorado Audubon Society, Friends of the Santa Clara River, John Muir Project, Los Angeles & San Gabriel Rivers Watershed Council, National Wildlife Federation Southwest Regional Office, San Diego Audubon Society, San Fernando Valley Audubon Society, Santa Clarita Organization for Planning & Environment, Sierra Club Tahquitz Group, and Spirit of the Sage Council.

The Sustainable Water Project Tour has visited Salt Lake City, Albuquerque, Phoenix, Las Vegas, and other cities along its route. Living Rivers and Glen Canyon Action Network are nonprofit advocacy groups dedicated to the protection and restoration of the Colorado River watershed.

#

"ONE PERCENT FOR THE DELTA" LETTER FOLLOWS.

March 14, 2001

Dear Water Agency/User:

On behalf of the 122 organizations and more than twelve million people they represent, we are writing to you to request your support for restoring the Colorado River delta.

As you know, the Colorado River is a limited source of water for millions of people in seven of the United States, Mexico and numerous Indian Nations. The river once supported a delta, marshland and estuary system of almost two million acres, but today has been reduced to less than ten percent of its original size because of near-total utilization of the river's flows, on both sides of the international border. It has been further compromised by land use changes in Mexico, the invasion of tamarisk (salt cedar), and the entrapment of sediment behind upstream dams, causing the delta to shrink rather than grow. The wetlands of the Colorado River delta have been designated

both a biosphere reserve and a Ramsar site (high-priority critical habitat area identified for protection and restoration under the international Convention on Wetlands).

Today the delta is in crisis; the birds and other wildlife, the fisheries, and the ecosystem are all in dramatic decline. Scientists have warned for years of the consequences of ignoring the lack of freshwater inflows. Some flood flows over the past twenty years have helped to keep the delta from drying up entirely, and even allowed for some modest improvement, but no mechanism is in place for the delta's long-term protection. Unless action is taken soon, we could lose what little still remains.

A significant obstacle to progress is the lack of agreement among the community of Colorado River water users to pursue a solution. We, the undersigned individuals and organizations, come to you with a request for acknowledgment of the seriousness of the problem, and a commitment to take action by voluntarily offering to leave in the river a very small portion of the water that your organization currently withdraws.

Scientists estimate that the restoration process can begin with a modest amount of water-less than one percent of the river's average annual flow. A guaranteed base flow of 32,000 acre-feet per year, augmented by a simulated flood flow of 260,000 acre-feet every three to four years would provide a minimal source of life-sustaining water for this once vast span of wetlands, riparian habitat, freshwater marshes and estuary.

We have an important responsibility to future generations to assure the preservation of this internationally acclaimed bioregion. Although such accommodations were not priorities when the Law of the River began to evolve, they have become a priority for society now. An average annual contribution of 106,000 acre-feet will help maintain what little remains along the river's main channel. This represents less than one percent of the 15 million acre-feet that the basin's water users divert on average each year. A modest amount indeed, but a major contribution toward preserving this endangered habitat and the many lives that it supports.

Therefore, we ask you to pledge "One Percent for the Delta"-a realistic goal that can readily be achieved by implementing additional water conservation measures. In addition, we ask that you pledge flows necessary to maintain the Cienega de Santa Clara at its current size and water quality. Finally, we ask that you support the delivery of additional water to the delta region when such water becomes available through purchase or voluntary agreement.

The United States and Mexico have agreed to meet, discuss and make recommendations for possible actions to implement a Colorado River delta restoration program. Your voluntary commitment will send an important signal to the governments of the two nations, amplifying the growing public support and consensus that the Colorado River, its delta wetlands, and the northern Gulf of California must once again become a place of life for humans and other living things.

We also request that you publicize to all your clients and customers the need for implementing these conservation measures in the context of delta restoration. All users should be made aware of the problems occurring in the delta and the simple steps we

can take to help remedy them. We are available to assist you and your organization in any way possible to put such a program in place.

Thank you for your attention to this matter, and we look forward to your reply and pledge of support.

Sincerely,

John Weisheit President Living Rivers/Glen Canyon Action Network

LR Press Release 03/12/01

Activist Roadshow for the Colorado Delta Stops in Las Vegas

Tour Groups Rally in Las Vegas for River Restoration through Water Conservation
"Sustainable Water Project Tour" Asks for Water for the Colorado River Delta
CONTACT: Owen Lammers, mobile 435.260.2590, 260.2591; message 435.259.1063
Lisa Force, mobile 602.321.1753

Monday, March 12, 2001 Noon-1:00 PM Las Vegas Valley Water District Headquarters
1001 South Valley View Blvd. (corner of Charleston)

Six Las Vegas-based organizations will rally on Monday to welcome the "Sustainable Water Project Tour" when it rolls into Las Vegas on the seventh day of a ten-day roadshow across the Southwest. The tour is promoting river restoration through water conservation, and is sponsored by Living Rivers of Phoenix, Arizona, and Glen Canyon Action Network of Moab, Utah.

Gathering at the headquarters of the Las Vegas Valley Water District, the groups will call on water-using agencies in the Colorado River basin to take action to restore the river's dying delta.

"We're only asking for one percent of the river's flows to reach the delta," said Lisa Force, Living Rivers' program director. "This is such a reasonable request to address an ecological emergency."

Citizen Alert, Friends of Nevada Wilderness, Nevada Desert Experience, Nevada Green Party, Shundahai Network, and the Sierra Club Southern Nevada Group are joining 115

other organizations representing more than eight million people in the United States and Mexico, in delivering a letter to the water district, asking for conservation measures to be implemented to provide assured flows for ecological restoration south of the international boundary.

Recent U.S. government figures show Nevadans use twice the national average--more than 200 gallons of water per person per day. By reducing their consumption to a level par with the rest of the nation, Nevada's citizens could save more than enough water to keep the delta's endangered species from going extinct.

"We need some water for the river and not for sprawl," said John Weisheit, President of Glen Canyon Action Network. "There's no reason we can't meet human needs and the needs of fish and wildlife."

Weisheit and his crew are driving an empty water tanker truck from city to city, symbolizing the need for donations of water from the agencies that collectively consume 100 percent of the Colorado River's flow.

On Sunday, the Sustainable Water Project Tour visited Hoover Dam, where the police chief graciously provided an escort for the water tanker truck across the dam's crest, to obtain a donation of water directly from Lake Mead reservoir.

The tour is being organized in conjunction with the Fourth International Day of Action for Rivers, March 14, 2001. From Las Vegas, the tour will head to Blythe, California, for a rally on Tuesday, March 13, and then to Los Angeles on Wednesday, March 14.

Living Rivers and Glen Canyon Action Network are nonprofit advocacy groups dedicated to the protection and restoration of the Colorado River watershed.

"ONE PERCENT FOR THE DELTA" LETTER FOLLOWS...

March 5, 2001

Dear Water Agency/User:

On behalf of the 121 organizations and more than eight million people they represent, we are writing to you to request your support for restoring the Colorado River delta.

As you know, the Colorado River is a limited source of water for millions of people in seven of the United States, Mexico and numerous Indian Nations. The river once supported a delta, marshland and estuary system of almost two million acres, but today has been reduced to less than ten percent of its original size because of near-total utilization of the river's flows, on both sides of the international border. It has been further compromised by land use changes in Mexico, the invasion of tamarisk (salt cedar), and the entrapment of sediment behind upstream dams, causing the delta to shrink rather than grow. The wetlands of the Colorado River delta have been designated both a biosphere reserve and a Ramsar site (high-priority critical habitat area identified for protection and restoration under the international Convention on Wetlands).

Today the delta is in crisis; the birds and other wildlife, the fisheries, and the ecosystem are all in dramatic decline. Scientists have warned for years of the consequences of ignoring the lack of freshwater inflows. Some flood flows over the past twenty years have helped to keep the delta from drying up entirely, and even allowed for some modest improvement, but no mechanism is in place for the delta's long-term protection. Unless action is taken soon, we could lose what little still remains.

A significant obstacle to progress is the lack of agreement among the community of Colorado River water users to pursue a solution. We, the undersigned individuals and organizations, come to you with a request for acknowledgment of the seriousness of the problem, and a commitment to take action by voluntarily offering to leave in the river a very small portion of the water that your organization currently withdraws.

Scientists estimate that the restoration process can begin with a modest amount of water-less than one percent of the river's average annual flow. A guaranteed base flow of 32,000 acre-feet per year, augmented by a simulated flood flow of 260,000 acre-feet every three to four years would provide a minimal source of life-sustaining water for this once vast span of wetlands, riparian habitat, freshwater marshes and estuary.

We have an important responsibility to future generations to assure the preservation of this internationally acclaimed bioregion. Although such accommodations were not priorities when the Law of the River began to evolve, they have become a priority for society now. An average annual contribution of 106,000 acre-feet will help maintain what little remains along the river's main channel. This represents less than one percent of the 15 million acre-feet that the basin's water users divert on average each year. A modest amount indeed, but a major contribution toward preserving this endangered habitat and the many lives that it supports.

Therefore, we ask you to pledge "One Percent for the Delta"-a realistic goal that can readily be achieved by implementing additional water conservation measures. In addition, we ask that you pledge flows necessary to maintain the Cienega de Santa Clara at its current size and water quality. Finally, we ask that you support the delivery of additional water to the delta region when such water becomes available through purchase or voluntary agreement.

The United States and Mexico have agreed to meet, discuss and make recommendations for possible actions to implement a Colorado River delta restoration program. Your voluntary commitment will send an important signal to the governments of the two nations, amplifying the growing public support and consensus that the Colorado River, its delta wetlands, and the northern Gulf of California must once again become a place of life for humans and other living things.

We also request that you publicize to all your clients and customers the need for implementing these conservation measures in the context of delta restoration. All users should be made aware of the problems occurring in the delta and the simple steps we can take to help remedy them. We are available to assist you and your organization in any way possible to put such a program in place.

Thank you for your attention to this matter, and we look forward to your reply and pledge of support.

Sincerely,

John Weisheit President Living Rivers/Glen Canyon Action Network

Arizona Republic

Truckin' for the environment Group pushing for Colorado River delta restoration
By Kathleen Ingley

Environmentalists drove an empty water tanker into Phoenix on Friday, dramatizing their call to boost flows in the Colorado River and bring life back to its delta.

Their campaign, "One Percent for the Delta," is asking water users to give up 1 percent of their river allocations.

"Because of our greed, we've killed the delta," said Lisa Force, program director of Living Rivers, a Phoenix-based advocacy group.

Over the years, dams and canals have captured most of the Colorado River, leaving only a trickle - if any - to go all the way to the sea. The delta, where the river meets Mexico's Gulf of California, has lost more than 90 percent of its vegetation in recent decades, she said.

"It used to be 2million acres of lush wetlands," Force said, "and it's now mostly dried mudflats." The animals and fish that live there, such as jaguars, are disappearing.

The "One Percent" campaign is touring major cities in the Southwest. At Friday's rally outside the Arizona Department of Agriculture, about three dozen people waved signs and chanted, "Let it flow."

Agriculture uses 80 percent of the water in Arizona, and is the logical place to cut consumption, said Frank Welsh, author of *How To Create a Water Crisis*. He suggests more efficient irrigation, and reducing crops that use a lot of water but have low value, like alfalfa.

Jack Lavelle of the Arizona Department of Water Resources said, "Agriculture is pretty efficient as it is," and the department is reviewing irrigation.

Environmentalists also urged individuals to save water, from fixing leaks to planting less grass.

But Robert Barrett, spokesman for the Central Arizona Project, which manages the 336-mile canal carrying Colorado River water to Phoenix and Tucson, said there's no way to make sure the river benefits from conservation.

"If Arizona gives up 1 percent," he said, "I can guarantee that California will take it."

There's also the risk that Mexican farmers will tap any extra water flowing south. Force said Mexico has signed an agreement to prevent that.

Top officials from the Department of Water Resources visited the delta just last week. "We're vitally concerned about anything that has to do with the Colorado River," Lavelle said.

But with the complexities of water rights and foreign policy, he doubts that the "1 percent" solution is feasible.

UNLV Rebel Yell

Roadshow tours to revive delta

By Shervin Hess

Next time you drive over the Hoover Dam, stick your head out the window and take a good look down the deep end. That rushing, gushing 20,000-cubic foot per second flow known as the Colorado River supplies 30 million people with H2O.

After being thoroughly tapped by Lake Mead, it continues south, providing every shower, flushing every toilet and irrigating every crop it happens upon until the end of

the line, a dried-up delta in Mexico. By the time its 1,400-mile journey to the sea is completed, 100 percent of its annual flow will have been consumed, making this river one of the largest plumbing systems in North America.

The Glen Canyon Action Network (GCAN) wants to restore this remnant of what was once considered one of the most diverse ecosystems in the Western U.S. They will be coming to Las Vegas next Monday as part of the Sustainable Water Project Roadshow. GCAN is driving an empty water tanker, symbolizing the thirsty Colorado, through six major cities, asking citizens and water agencies to "give back 1 percent for the Delta." This is in reference to roughly 1 percent of the river's average annual flow, which scientists agree would be sufficient to keep the estuary and wetlands complex alive.

"If everybody flushed their toilets once less per day, it would give us the one percent we need to restore the delta," explained GCAN Executive Director Owen Lammers.

Seven states and Mexico have beneficial interests in the Colorado River Basin. The average water consumption in the U.S. is 101 gallons per person, per day. Nevadans devour nearly twice that, making us the largest per capita water consumers in the country. Rapidly evaporating fountains, golf courses and artificial canals are the main source of the problem, but Las Vegas can conserve by simply being careful not to waste.

The focus of GCAN's visit will be to rally at the Las Vegas Valley Water District at noon Monday on the corner of Valley View and Charleston. GCAN invites the community to participate at their meeting with District Director Patricia Mulroy.

According to Lammers, Las Vegas, the leader in nonessential water consumption, has the opportunity to show a lot of leadership by owning up to conserving that 1 percent for the Colorado.

"We're talking about a need for water conservation not for the benefit of additional development, but to put back in the river," Lammers added.

For more information on the Sustainable Water Project Tour visit GCAN's Web site, www.drainit.org. @drainit.org

Media Advisory 03/08/01

Activists Tour for the Colorado Delta Stops in Phoenix

Tour March Rally a Call to Curb Water Over-Consumption March Rally a Call to Curb Water Over-Consumption

For Immediate Release: March 8, 2001 Contact: Lisa Force (480) 990-7839 Michelle Harrington (602) 628-9909

Event: Rally to ask Arizona users of Colorado River water to share just 1% with the suffering people and species of the Delta

When: Friday, March 9, 2001 Time: 11 a.m - Noon (A light lunch will be served) Where: In front of the Department of Agriculture Bldg, 1688 W. Washington (Cattycorner from the Capitol Mall; Free parking at the Capitol Mall parking lot)

Speakers: Lisa Force; Robert Witzeman, M.D.; Frank Welsh, author of How to Create a Water Crisis; Owen Lammers, executive director of Glen Canyon Action Network in Moab, UT

Music By: Chemehuevi Indian Drummers, Peace and Dignity Journeys Visuals: 40-foot 'dancing' Chinese Dragon, representing rivers' energy Water 'donations' poured into empty water truck

Phoenix, Arizona (February 22, 2001) - Arizona depends heavily upon Colorado River water. Even as cities grow, ecosystems suffer and demand for water increases, trillions of gallons of water are wasted. Phoenix-based Living Rivers and a broad coalition of 120 organizations, representing 8 million people, will hold a rally and news conference where they will publicly call upon users and distributors of Colorado River water to conserve and leave just 1% in the river to restore the Delta in Mexico.

The Colorado River is the most dammed and diverted channel of water in the United States. Traveling through seven states and into Mexico, the Colorado ends at the Gulf of California. However, these days, the river rarely meets the sea. Living Rivers is touring cities of the Colorado River Basin, with an empty water truck, seeking 'donations' of water for the Delta. The Tour began in Salt Lake City on March 5.

"We have been getting terrific public support and response at these rallies," says Living Rivers program director, Lisa Force. "The 'One Percent for the Delta' campaign serves a very modest and attainable goal-the restoration of crucial ecological habitat that supports Native people and numerous species who depend on it for survival. The delta can be revived with an average of less than one percent of the river's total flow in most years. We are asking agencies to conserve a very modest amount of water towards restoring the once vast Colorado River Delta ecosystem," says Force.

In addition to this rally, a presentation will be held at ASU beginning at 2 p.m. in Room LSA163 in the Science Building at 2:00 p.m. to discuss the issues and potential restoration on the Colorado River, including Glen Canyon Dam and the Delta. The presentation is open to the public.

03/08/01

Day 4...Sustainable Water Project Tour

This day was mostly a driving day, as we had to cover 550 miles and two watersheds! We pulled out of Albuquerque around noon, headed south on Interstate 25 for the town of Belen, an old farming community along the Rio Grande River. We passed by the University of New Mexico's Championship 18-hole golf course in south Abq, but we did not have time to stop for a photo op or a tee off. UNM promotes this golf course as a

site for national golf tournaments. The City of Albuquerque boasts of more than 15 courses in the city. Well-watered, no doubt.

The first community we pass through is the Isleta Pueblo Indian Reservation. The Rio Grande flows through the Isleta Nation. The tribe, for whom the river is sacred, successfully sued the City of Albuquerque several years ago for dumping partially treated sewage into the river upstream of the reservation. This established an important legal precedent for both environmental protection and tribal sovereignty, because the courts for the first time recognized that Indian nations have authority to enforce environmental laws on their lands and in their streams, even if the culprit is off the reservation.

We were heartened to see a healthy, dense riparian forest of cottonwoods, willows, and other native plants along the riverbanks as we crossed the river at Isleta. The local term for this riparian forest is "bosque," and the bosques are in real trouble because of lowered water tables caused by heavy agricultural water withdrawals and by clearing land for crops. In many areas of the Rio Grande, exotic tamarisk (salt cedar) has invaded and choked out native vegetation.

The Rio Grande south of Albuquerque is often two parallel streams--the river and one or more ditches. At certain times the ditches carry more water than the river.

Our first stop for the day was the Middle Rio Grande Conservancy District (MRGCD) in Belén, one of a string of communities along the river that have been inhabited for centuries. Some are called "pueblitos"--a term that evokes the rich Hispanic heritage of the region.

The MRGCD has its corporate headquarters in Albuquerque but we chose instead to visit the distribution arm of the Irrigation Division, a nondescript cinder block structure with no identifying signage. We drove the water truck into the parking lot for our photo op, then we walked inside. There we met the affable Manager, Mr. Richard Jaramillo. We presented him with a copy of our letter requesting one percent for the Colorado River delta, and asked for his consideration. He very politely responded by telling us that he would bring this issue to the attention of his board of directors. We thanked him for his time and headed back out on the road.

I-25 follows the river south. It's just another piece of industrial infrastructure on the landscape, but the freeway also reflects the determinative role the river has played in the cultural and economic geography of the southwest. Where for generations people walked, and later rode horseback, along the river, today a steady stream of autos, RVs, 18-wheelers, and yes, (full) water tankers flows by...

We pass by the Sevilleta National Wildlife Refuge near Socorro, and later the Bosque del Apache Refuge. These refuges are vital to the waterfowl populations that migrate along the Rio Grande. Sadly, however, agribusiness and hunters keep a tight rein on the management of these refuges. Parts of the refuge are open to hunting, where the trigger-happy can find joy in shooting ducks at the "refuge."

Alfalfa and other grain crops are grown for cattle feed and duck feed on these federal public lands, providing yet another subsidy to the livestock industry in a region whose economy was largely founded on such subsidies.

We rolled into Truth or Consequences, N.M. in late afternoon. This charming town, known for many years as "Hot Springs," made a deal with a TV game show back in the 1950s, in which the town changed its name to help promote the program. Today the town's name could well apply to the management of the river that flows by it.

We had water, not TV, on our minds however as we drove through downtown T or C, as it's known locally. We were headed to the far side of town, to a place known as Elephant Butte Dam on the Rio Grande. This was one of the first concrete dams constructed by the US Bureau of Reclamation in the early twentieth century. Rather ornately accented by a row of lights on concrete standards across the dam's crest, the dam is a sad sight. The reservoir has the dubious distinction of evaporating as much as 25% of the river's flow.

The water level in the reservoir was low, as usual. This reservoir is one of several in southern New Mexico that divert water for the state's agricultural sector. The town of Hatch, a few miles downstream from T or C, is the world-renowned center of the chile pepper industry. The peppers are a mainstay of the economy and the culture of the valley and are grown with Rio Grande water. But the biggest crop of the valley is cattle feed such as alfalfa, grown for the benefit of feedlots and dairy farms in the vicinity.

Our water truck was one ton over the weight limit so we were unable to drive across the dam. We did get a photo of the truck, though, with the dam in the background.

Back on the highway, we cruised across the stunningly beautiful landscape of the Chihuahuan Desert and over the Continental Divide, where we re-entered the Colorado River watershed. The Gila River, which rises in the Gila Wilderness country to the north, is a tributary of the Colorado. We'll be travelling through the Gila's watershed as we pass through Tucson and Phoenix.

As we pass into the Great State of Arizona, we are detained briefly at the Weigh Station where the authorities express skepticism at our story that we are driving this 11-ton truck around the Southwest for environmental education purposes. But they can't find anything to cite us for, so they let us go and we are off once again into the night.

The moon is almost full and we drive through southern Arizona in the soft lunar glow. Our destination tonight is Phoenix, and tomorrow we will rally downtown. Stay tuned for the next report!

03/07/01

Day 3...Sustainable Water Project Tour

Albuquerque Welcomes Sustainable Water Project Tour

Albuquerque, N. Mex., March 8 -- The tour continued in Albuquerque yesterday as we gathered at City Hall Plaza to call on the city to give back one percent of its contracted water from the San Juan River and assist in restoring the dying Colorado River Delta.

A light rain set in at noon as the program commenced with presentations by leaders of the Diné Medicinemens Association. Thomas Morris, Jr., and Phillip Bluehouse addressed the crowd both in the Navajo language and in English about the importance of water and about healing the damage that has been done to our rivers.

Bill Guerra Addington, a leader of the Albuquerque-based Water Information Network and a resident of the Rio Grande Valley in Sierra Blanca, Texas, spoke about the need for restoring the Rio Grande, where the river sometimes runs dry from upstream diversions. The cities of Albuquerque, Ciudad Juarez and El Paso and large farms in the valley take life-giving water out of the streambed, imperiling river-dependent species such as the endangered Rio Grande silvery minnow. Addington said that the river where he lives is a meager trickle compared to the healthy flows of many years past.

John Horning of Forest Guardians, based in Santa Fe, addressed the crowd on the current ecological crisis on the Rio Grande, where dewatering of the river in recent summers has pushed fish species to the brink of extinction. One of the prime culprits is the Middle Rio Grande Conservancy District (MRGCD), which withdraws up to four times more water from the river than the next larger user. The MRGCD provides irrigation water primarily for growing alfalfa and other cattle feed crops. Horning said that because the MRGCD has never perfected its water rights with the State Engineer's Office, it is operating outside New Mexico state water law.

John Weisheit, President of GCAN, introduced our letter on behalf of 121 organizations in the US and Mexico, seeking donations of one percent of currently used water diversions to restore the Colorado River delta. John spoke about the diversion of water to the Rio Grande from the San Juan River basin through the San Juan-Chama Project tunnel in northern New Mexico. This tunnel takes water out of the Colorado River basin to be used for growing cattle feed in the Rio Grande valley. The City of Albuquerque has more than 50,000 acre-feet of San Juan-Chama (SJ-C) water under contract, and has expressed intention to build an expensive water treatment plant to use SJ-C water as the city's primary municipal supply.

Our letter, which we will present to Mayor Jim Baca, asks the city to join our "One Percent for the Delta" effort and reallocate some of the city's contracted water to restoration.

Musical entertainment was provided by Peter Neils, a local activist and singer who performed original music he wrote to commemorate the exquisite beauty as well as the environmental tragedy of the Rio Grande River today.

Our program was capped off by singing and drumming from the Peace & Dignity Spirit Runners, who performed traditional Native American music. The runners, Moe Gonzalez and Jesús Figueroa, are travelling with us the entire journey. They are helping us plan a Spirit Run that will celebrate the river.

Following our City Hall rally, we loaded up the trucks and drove out to the banks of the Rio Grande River along the old Route 66 east of downtown. There, we had a brief ceremony with Albuquerque activists and medicine people.

We saw a river lined with large, old cottonwood trees and some newly planted trees that are part of a restoration program in the community.

From the riverbanks, we drove a short distance to visit with new friends at the Southwest Network for Environmental & Economic Justice (SNEEJ), a group of community activists working primarily on environmental justice issues in and around the Albuquerque metropolitan area. SNEEJ has been particularly effective at raising awareness of the impact that the local Intel microchip plant has had on the local environment and social fabric of the community. Intel is one of the largest industrial water users in the Rio Grande valley.

We joined our friends from KP Vision Paper for a spicy New Mexican dinner. Tom and Lynn Rymsza are the founders of the kenaf paper industry in the United States, and have their headquarters here in Albuquerque. We discussed the promise of a growing shift to alternative fiber papers, and the prospects for developing a larger kenaf industry to relieve pressure on our forests. The production of kenaf paper uses no chlorine and half the amount of water of typical tree-based paper pulping. The conversation turned to the question of when U.S. environmental groups will abandon tree-fiber paper for the environmentally preferable kenaf fiber. Although it currently costs about twice as much as tree-fiber paper, kenaf is used by GCAN and a growing number of smaller groups to protect forests and create a viable market for the fiber. By building demand for kenaf, we help to bring the price down. We encourage all environmental groups to join with us in demonstrating that paper needs can be met without destroying forests and watersheds.

From Albuquerque today, we are heading south on Interstate 25, following the course of the Rio Grande River first to the town of Belén and home office of the MRGCD, where we will present our letter. Our next stop will be the Elephant Butte Reservoir near Truth or Consequences, NM. This reservoir is formed by one of the first concrete dams ever constructed by the US Bureau of Reclamation early in the twentieth century. As much as 25% of the river's flow evaporates from the reservoir annually into southern New Mexico's desert skies. Our next rally will be tomorrow morning in Phoenix, Arizona, at the State Department of Agriculture building downtown.

Day 2... Sustainable Water Project Tour

MEDICINEMEN, ACTIVISTS PRAY FOR DECOMMISSIONING OF NAVAJO DAM NAVAJO DAM, N. MEX.,

March 6 -- An unusual alliance of environmentalists and Native American traditional and spiritual leaders gathered today at the crest of Navajo Dam on the San Juan River east of Farmington, New Mexico, to conduct a healing ceremony for the river and for the decommissioning of Navajo Dam.

This site was chosen as the second stop in our five-state "Sustainable Water Project Tour" of the Southwest sponsored by Glen Canyon Action Network, Living Rivers, the Diné Medicinemens Association, and 121 organizations in the U.S. and Mexico, to focus public attention on the need for restoration of the Colorado River watershed and its delta.

We were forced to delay our 3:00 PM damsite ceremony beyond its originally planned start time while we waited for uninvited law enforcement officials to leave the area, and provide for a calm environment in which to conduct the ceremony.

Activists joined leaders of the Diné Medicinemens Association (DMA) and the Peace & Dignity Spirit Runners to grieve the loss of a large number of sacred sites inundated by the waters of Navajo Reservoir, following construction of Navajo Dam in 1962.

Over the course of the day, DMA President Thomas Morris, Jr. of Window Rock, Arizona, conducted three ceremonies calling for the restoration of ecological and cultural resources along the San Juan River and throughout the Colorado River basin.

"I came here early in the morning today to pray for the river, Earth, and sky, and apologize for what has been done to harm them," said Mr. Morris who as a young man visited the sacred area now flooded beneath Navajo Reservoir with his grandfather, also a medicineman. "The costs we have been forced to pay for the convenience of storing all this water are only now being accounted for."

Ancient archeological and ceremonial sites, as well as the entire town of Santa Rosa, New Mexico, were submerged beneath the rising waters of the reservoir almost forty years ago.

Costs for the Navajo Indian Irrigation Project (NIIP) near Farmington, for example, are still rising, thirty years after the project was supposed to have brought prosperity to the Navajo people. Water from Navajo Reservoir is used by the Navajo Nation to grow mostly low-value crops, such as alfalfa and potatoes. Recently, the Tribal Council approved a \$10 million dollar bailout for the fiscally troubled program.

Once we had been notified that the damsite was occupied by law enforcement officers prior to our prearranged 1:00 PM ceremony, we chose instead to conduct a service at an undisclosed nearby site downstream of the dam. We met on the banks of the San Juan River to pray for the river's release to allow the San Juan to flow unimpeded to the sea.

"This river, once a vital tributary to the Colorado River, is sick and dying," said John Weisheit, President of GCAN. "Dams and diversions are now draining the river dry."

While the riverside ceremony was underway, law enforcement officers, thinking the event at the dam's crest had been cancelled, left the area. Once the natural calm had been restored, we caravanned to the dam where the last ceremony of the day was conducted.

After a series of traditional prayers, songs, and drumming, the ceremony concluded by pouring into the tour's water tanker truck a symbolic donation taken from Navajo Reservoir.

The truck, emblazoned with the slogan "An Ecosystem, Not a Plumbing System," accepted the water donation for later delivery downstream in a demonstration of the need for restoring water flows to the river's delta in Mexico.

We departed from Navajo Dam in high spirits, heading south for Albuquerque, New Mexico, the next stop on our tour, where we will rally at noon on Wednesday, March 7, at City Hall, calling on the City to give back one percent of its contracted water from the San Juan River diversion to help keep the Colorado River delta alive.

Salt Lake Tribune

Tour Groups Want Water Left in Colorado River
BY BRENT ISRAELSEN

There is a new rallying cry among environmentalists. "One percent for the delta!" No, it's not about giving another tax break to Utah's favorite airline. It's about keeping more water in the Colorado River -- water that would flow all the way to a dying delta at Mexico's Sea of Cortez. "Scientists say we need at least 1 percent [of the Colorado River's historic flow] just to keep the delta on life support," said David Orr, field director for the Moab-based Glen Canyon Action Network. Orr's is one of 120 environmental groups that on Monday launched a five-state "Sustainable Water Project Tour" to call attention to the delta's plight and to urge the U.S. government and Colorado River water users to leave water in the river.

For much of the year, the delta -- once a 2 million acre oasis to hundreds of species of birds and fish -- is a mudhole, shrunk by 60 years of dam-building and diversions on the Colorado River. The projects have provided water and electricity to Wyoming, Colorado, Utah, New Mexico, Arizona, Nevada and California, as well as Mexico.

Bring on another drought cycle and the delta will shrink even more, further endangering dozens of endangered species, not to mention the livelihoods of Mexicans and Indians who depend on the delta for survival.

Environmentalists -- who demonstrated Monday outside the U.S. Bureau of Reclamation downtown -- say it is time for states to reduce their water demand, leaving more of it in the river.

"We're talking just 1 percent. That's not a lot to ask," Orr said. One percent of the river's historic (pre-dam era) annual flows equals about 150,000 acre feet of water, or about 48 billion gallons.

In a good year, only 2 million acre feet of water finds its way to the delta, but much of it is salt-laden "return flows" from agricultural lands. The rest of the water comes in the cooler months, when it is not needed.

An additional 150,000 acre feet of fresh water would come as welcome relief to the over-stressed delta, said Mark Briggs, an ecosystem restoration researcher at the Tucson, Ariz.-based Sonoran Institute.

Ideally, most of the additional water would be delivered during May, June and July, when new plants are struggling to survive, Briggs said.

The simplicity of the environmentalists' 1 percent plan is overshadowed by the complexities of the river's politics and its overallocation in a region that is the fastest-growing in the nation.

Getting seven western states and Mexico -- along with all their agricultural and municipal water users -- to agree on giving up water for environmental purposes will require no small miracle.

The river users are focused on protecting their allocation (see box) and ensuring that California reduces its draw on the river. Though entitled to 4.4 million acre feet, California currently uses about 5.2 million.

There is cause for hope, however. In December at the annual meeting of the Colorado River Water Users Association, Patricia Mulroy, general manager of the Southern Nevada Water Authority, told her fellow water users that they no longer can ignore the delta.

And for the first time in the 60 years of water development along the Colorado River, the Mexican government, powered by a new political party, is putting environmental concerns on its agenda.

The Sustainable Water Project Tour, which consists of an empty water truck decorated with environmental slogans, will run for 10 days with stops in Albuquerque, Phoenix, Las Vegas, the Imperial Valley of Southern California and Los Angeles.

How the water of the Colorado River is divvied up: California: 4.4 million acre-feet
Colorado: 3.86 million acre-feet
Arizona: 2.85 million acre-feet
Utah: 1.71 million acre-feet
Wyoming: 1.04 million acre-feet
New Mexico: 838,000 acre-feet
Nevada: 300,000 acre-feet

03/05/01

Day One...Sustainable Water Project Tour

Tour Launch at the Bureau of Reclamation

On a brisk Monday morning, our empty water-tank truck rolled to a stop in front of the Wallace Bennett Federal Building in Salt Lake City. The large, white water truck—weighing in at 23,000 pounds gross vehicle weight and normally used for dust control on construction sites—was emblazoned on both sides with large banners proclaiming the Colorado River “An Ecosystem, Not a Plumbing System.” The truck symbolized our urgent call to the US Bureau of Reclamation (BuRec) to encourage Colorado River water agencies to voluntarily give back at least one percent of the Colorado River water they currently use, in order to restore the river’s dying delta south of the border with Mexico.

A dozen Utah-based groups gathered on the downtown plaza, cheering as speakers, musicians and Native American drummers stepped up to the microphone, one after another, sharing their concerns about the Colorado River’s decline and their hopes for quick corrective action by the water agencies. The rallying cry was “1% for the Delta, 1% Now!” The program opened with traditional drumming and singing by the Peace and Dignity Spirit Runners, Native Americans who have made several trips from Alaska to Mexico on foot, while nine activists danced with a 50-foot Chinese Dragon named Glen, who made his debut a year ago at a rally calling for the decommissioning of Glen Canyon Dam, the second largest dam on the Colorado.

One of the hot-button issues raised by environmentalists at the rally is a proposed water pipeline that would pump water from Lake Powell reservoir on the Colorado River to faraway St. George, Utah. Southern Utah Wilderness Alliance attorney Steve Bloch said this project would threaten areas proposed by citizens groups for wilderness protection, and spur development sprawl in the environmentally sensitive Mohave Desert. Utah has the third-highest per capita water consumption of any state in the US, and St. George reportedly has the highest water consumption rates in Utah. Making more subsidized water available for a growing community would only stimulate more unbridled, unsustainable growth.

Denise Boggs of the Utah Environmental Congress, a group that fights timber sales and grazing on public lands, pointed out that the ecological integrity of the entire Colorado River watershed is threatened by resource extraction, and called for ending federally subsidized logging and grazing programs. By redirecting the huge subsidies that flow to these industries today, to worker retraining and ecological restoration public works projects, we could protect the Colorado River basin all the way from its headwaters downstream to the delta—the end of the “pipeline” of the Colorado River. Eric

Ward of the Utah Animal Rights Coalition brought along a friendly cow (okay, it was really a vegan in a cow costume) to graphically identify the primary consumer of crops grown with Colorado River water. Growing alfalfa, a crop that requires huge amounts of water, is a wasteful and inefficient use of irrigation water. Ward said that if we were to grow less feed for cattle, and more fruits and vegetables for humans, we could reduce

our consumption of Colorado River water while encouraging more people to eat a healthier diet. By eating less meat, or giving it up altogether, we could reduce our environmental impacts in many important ways.

At the rally's finale, John Weisheit, president of GCAN and Living Rivers, read the letter he would be presenting to the regional director of BuRec on behalf of 122 organizations calling on Colorado River basin water agencies to give their one percent for the delta. Weisheit and Living Rivers project director Lisa Force then ceremoniously dumped a bucket of Central Utah Project water into the empty tank of the water truck, symbolizing the need for water donations for the thirsty delta. The action exemplified the grassroots nature of the "1% for the Delta" campaign, and the effort that would be required in the coming

months to raise awareness and pressure the water agencies to do the right thing. The event was reported on by television, radio and print journalists. Following the Salt Lake City event, we drove southward to the Colorado Plateau, to GCAN's home in Moab for a good night's sleep, one of the last we'd have for some days to come.

LR Press Release 03/02/01

GCAN Launches the

"Sustainable Water Project Tour"--Itinerary
Groups Call for Restoring the Colorado River Delta

CONTACT: Owen Lammers, 435-259-1063

Moab, Utah--The Glen Canyon Action Network will launch our five-state, six-city tour of the Southwest on Monday, March 5, calling for restoring flows to the Colorado River delta. Working with over eighty groups in the U.S. and Mexico, GCAN and our sister organization in Phoenix, Living Rivers, are organizing a "Sustainable Water Project Tour" that will visit Salt Lake City, Albuquerque, Phoenix, Las Vegas, Blythe CA, and Los Angeles, carrying our message of River Restoration Through Water & Energy Conservation to the public.

These events coincide with the celebration in dozens of other countries of the Fourth International Day of Action For Rivers, Water and Life. Last year, many of you joined us in celebrating the Day of Action with our late cofounder David Brower at Glen Canyon Dam. This year, however, we're taking our show on the road, directly to the people!!!

We'll be driving an empty water tanker truck on our tour, symbolizing the dying delta's desperate need for water, and we'll be soliciting donations from the very water agencies responsible for draining the river dry. We will ask in a letter for these agencies to voluntarily contribute "One Percent for the Delta." This is in reference to an amount of water roughly equal to one percent of the river's average annual flow, that scientists agree is needed just to keep the once-vibrant estuary/wetlands complex alive--on life support.

Surely the agencies should agree to a plan that would help prevent the extinction of species dependent on restoring freshwater flows to the region that was, only fifty years ago, still considered to be one of the most significant biodiverse ecosystems in the Western U.S.!

This is the first broad-based organizing effort among the basin's environmental and social justice communities, of the need to transform this vast plumbing system back to an ecosystem.

We invite you to join us at one or more of our stops along the way (see schedule below) and have fun rallying with us for the rivers. Rallies will underscore the timeliness of the delta restoration effort, and provide water users an opportunity to demonstrate leadership and responsibility for repairing the damage caused by diversions so extensive that the river no longer reaches the ocean.

In addition to the advertised tour events listed on our website (www.drainit.org), we are planning some unscheduled events along the way that will further highlight the themes and issues that are important to the restoration of the watershed.

GCAN will be announcing these "extra" events throughout the tour, which begins noon Monday, March 5 at the Federal Building in Salt Lake City.

From the regional office of the Bureau of Reclamation, we will embark on our journey that will take us to a rendezvous on Tuesday the 6th at Navajo Dam on the San Juan River in northern New Mexico. There we will be joined by representatives from the Diné Medicinemens Association and the Native Environmental Justice Advocacy Fund and other San Juan River activists. We'll discuss actions we can take to address the many problems of the San Juan--including the pending construction of the Animas-La Plata reservoir project. Join us at 1:00 pm at the top of the dam, if you can make it!

We'll make our way south from Navajo Dam down to Albuquerque for a rally at noon on Wednesday, March 7, at the plaza across from City Hall. We'll be raising awareness of the city's plan to begin using Colorado River basin water from the San Juan-Chama Project to support more growth and development along the Rio Grande!

Following our event in "Duke City," we'll hit the road again and head to sunny Arizona. We'll meet our friends from Living Rivers in Phoenix for a downtown rally at 10:30 AM on Friday, March 9, at the State Department of Agriculture, to be followed by an afternoon teach-in at the Arizona State University campus (email us for location, time, etc.).

We're heading north to Flagstaff from Phoenix, where we will visit our friends at the Flagstaff Activist Network on Saturday. This is just a stopover on the way to our next event, to be held sometime Sunday afternoon at the legendary Hoover Dam on the Arizona-Nevada border. We invite you to join us for this unpublicized tour stop, where we'll enjoy the thrill of driving our tanker truck across the world's most famous dam!

Once we've had our fill of fun and frolic at Hoover Dam, we're off to that Den of Iniquity, La\$ Vega\$, where they gamble every day with the future of the Colorado River. Join us for an action-packed, fun-filled whirlwind tour of such memorable sights as the world-famous Bellagio Casino, home of one of the world's largest (computer-controlled!) fountains, shooting precious Colorado River water high into the desert skies, 24/7. We'll visit the steel-gated Desert Lakes subdivision, where opulent multimillion-dollar palaces line artificial canals. But the focus of our visit will be a rally at the Las Vegas Valley Water District at noon, Monday, March 12, at the corner of Valley View and Charleston. We invite you to participate as we seek a meeting with the District Director Patricia Mulroy.

From Vegas, we head south to Laughlin, home of the infamous Mohave Generating Station, that burns coal mined on the Hopi Reservation at Black Mesa. We'll drive the truck past the last set of casinos and across Davis Dam (that forms Lake Mohave) back into Arizona. We'll head south to visit the Central Arizona Project canal and stop for a photo op at the ORIGINAL London Bridge, one of the world's weirder tourist attractions on "beautiful" Lake Havasu.

Farther south, we'll cross over Parker Dam--the world's DEEPEST dam (it's not high, it's deep!) into the Golden State of California, and we'll stop near the intakes for the Colorado River Aqueduct, the second-largest volume water extraction system on the river. Following the river south, we'll travel through the Mojave Desert to see the Palo Verde Diversion Dam, then we'll pay our respects to the Giant Desert Figures, one of the largest rock art sites in North America and a sacred site for local Indian tribes.

The evening of March 13th, we'll meet up with farm workers in Blythe, CA, to rally in protest of the proposed Blythe Energy Project, a gas-fired power plant for which the Governor wants to fast-track the construction permits. The farm workers see their jobs going up in smoke if the plant is built, since the water that is proposed to cool the plant is currently used to irrigate high-value citrus crops. The orchards are to be sacrificed to sell peaking power at retail prices to far-away consumers.

That night, we'll drive by moonlight into Los Angeles and we'll rendezvous with activists from across Southern California for a noon rally at the Old Pueblo Plaza downtown on Olvera Street--across the street from the headquarters of the Metropolitan Water District! We'll enjoy music and traditional dancing, as we prepare for a March to the River--the L.A. River, that is. From Olvera Street, we'll walk a mile to the Cornfields, a site proposed for a mega-condo project that is also the site of the earliest Euro-American irrigation project in western North America. There near the banks of the concrete-lined channel that is the once and future Los Angeles River, traditional practitioners will conduct a planting ceremony to symbolize the beginnings of a social movement for watershed restoration.

We are grateful to all the many activists and organizations that have volunteered their time to help us make this tour a success, and we thank them in advance for all their assistance and cooperation.

Please check our website daily at www.drainit.org for details on the events as they unfold. We hope you will be able to meet up with us along the way, and for those of you who can't make it this time, we'll keep you posted and hope to see you at our next event!

LR Press Release 03/02/01

Groups Launch

Contact: Owen Lammers, 435-259-1063, cell 435-260-2590 Lisa Force, 480-990-7839, cell 602-321-1753

Environmental and community groups across the Southwestern United States and Northwest Mexico are calling for restoration of the Colorado River's delta. More than seventy-five NGOs are taking their concerns directly to the people with the "Sustainable Water Project Tour," set to begin in downtown Salt Lake City on Monday, March 5, at a rally at the Federal Building.

Led by Glen Canyon Action Network (GCAN) of Moab, Utah, and Living Rivers, of Phoenix, Arizona, the travelling roadshow will seek donations of Colorado River water to restore flows to the dried-up delta just south of the U.S.-Mexico border.

"It took millions of years to form the vast delta region of the Río Colorado, but it took only fifty years to destroy," said Ernesto Reynoso of the Centro Regional de Estudios Ambientales y Socioeconomicos, based in Mexicali, Mexico. Señor Reynoso will be participating in several of the tour events.

The groups will drive an empty water tanker truck, symbolizing the lack of water in the delta, to additional rallies in Albuquerque, Phoenix, Las Vegas, Blythe CA, and Los Angeles.

A letter will be sent to water users seeking voluntary contributions of "One Percent for the Delta"--of their currently used Colorado River water allocations. Rallies will underscore the timeliness of the delta restoration effort, and provide water users an opportunity to demonstrate leadership and responsibility for repairing the damage caused by diversions so extensive that the river no longer reaches the ocean.

"This is the first broad-based organizing effort among the basin's environmental and social justice communities, of the need to transform this vast plumbing system back to an ecosystem," said John Weisheit, President of GCAN.

The Colorado River basin today contains more than forty dams and diversions, and functions more as a system of regulated canals and reservoirs than a river. One of the Colorado's major tributaries (Gila River) typically runs dry for approximately 150 miles in Arizona.

Groups are targeting the delta now because the U.S. and Mexican governments recently agreed to explore legal and technical means of assuring restorative flows to the delta. The Sustainable Water Project Tour is encouraging the two nations to take seriously their responsibility to ensure the survival of the people and wildlife that depend on the delta.

"It's time for the water agencies to take responsibility for their practices," said Lisa Force of Living Rivers. "We hope they will agree to work with us to find long-term solutions that will meet both human and ecological needs."

Additional events will be held at the City Hall Plaza in downtown Albuquerque, Wednesday, March 7; the State Department of Agriculture Building in downtown Phoenix, Friday, March 9; Las Vegas Valley Water District in Las Vegas at the corner of Valley View & Charleston, Monday, March 11; Todd Park near City Hall in Blythe CA, Tuesday, March 12; and the Olvera Street Plaza in downtown Los Angeles, Wednesday, March 14.

For details on these events, please check the GCAN website, or call GCAN or Living Rivers at the phone numbers listed above. Glen Canyon Action Network is a nonprofit advocacy group dedicated to the protection and restoration of the Colorado River watershed. Living Rivers is an advocacy organization specializing in public education for river restoration and water conservation in the Southwestern United States.

These events are organized in support of the Fourth International Day of Action Against Dams and For Rivers, Water and Life, March 14, 2001. For additional information on Day of Action events elsewhere in the world, please contact International Rivers Network in Berkeley, CA. Phone: 510-848-1155; www.irn.org.

LR Press Release 03/02/01

Sustainable Water Project Tour to Stop in Albuquerque

CONTACT: Owen Lammers, 435-259-1063, mobile 435-260-2590 John Horning, 505-988-9126

Wednesday, March 7, 2001 Noon-1:00 PM Albuquerque City Hall (Civic Plaza)

Fresh from its kick-off event at the US Bureau of Reclamation Regional Offices in Salt Lake City and organizing meetings with river restoration advocates along the San Juan River, the Sustainable Water Project Tour will roll into Albuquerque on Wednesday, March 7 for a rally at City Hall.

Sponsored by more than ninety advocacy groups from throughout the Southwest, across the country and from Mexico, the tour is publicizing the need for water agencies using Colorado River water to give back one percent of their water to restore the Colorado River delta. The City of Albuquerque has rights to water that otherwise would flow to the Colorado River delta. It is diverted from the San Juan River of the Colorado watershed into the Chama River of the Rio Grande.

"These are ecosystems, not plumbing systems," says John Weisheit, President of Glen Canyon Action Network, one of the principle organizers of the six-city, ten-day tour. He and the others are traveling with an empty 4,000-gallon water tanker truck to symbolize the need for water donations to the dying Colorado River delta, and donations to parched rivers everywhere.

"We hope the City will help us keep some of the water in the San Juan, and let the water's life-giving forces reach all the way to the delta and the sea," says Thomas Morris, Jr., President of the Diné Medicinemens Association, who will be traveling with the Tour to Albuquerque. "We must learn to meet our needs without being so wasteful and disrespectful of our rivers and our mother earth."

According to the most recent US Geological Survey figures, New Mexico's domestic water use is more 86% higher than the national average of 101 gallons per person per day. That's an additional 7.8 water tank trucks per year for every person in New Mexico. Water conservation and recycling programs are available now that can could bring this consumption down considerably, saving more water annually than the combined amount being asked of all Colorado river water users to help restore the delta.

"If the City of Albuquerque, the Middle Rio Grande Conservancy District and other San Juan-Chama contractors did a better job of conserving water and devoting it to ecosystem purposes we wouldn't be in our current dire straits--in both the Rio Grande and Colorado river basins," says John Horning, with Forests Guardians of Santa Fe, a co-sponsor of Wednesday's rally.

"As we sit here upstream, it's easy to forget the damage our water use may be doing to critical environments hundreds or thousands of miles away. The Colorado River delta is dying, the Rio Grande's too. It's time to get serious about water conservation," adds Weisheit.

Among the others joining Morris, Horning and Weisheit at the rally will be Sage Remington, of the Native American Environmental Justice Advocacy Fund, and Peace and Dignity Journey from the Chemehuevi Nation of the Lower Colorado who will perform traditional music.

The tour is being organized in conjunction with the 4th International Day of Action Against Dams and for River Water and Life, March 14, 2001. From Albuquerque, the tour will head to Phoenix, across Hoover Dam to Las Vegas, to Blythe California and concluding in Los Angeles on March 14.

Glen Canyon Action Network, based in Moab, Utah, is a nonprofit advocacy group dedicated to the protection and restoration of the Colorado River watershed.

Forest Guardians, based in Santa Fe, New Mexico, works to protect and restore the native biological diversity and watersheds of the American Southwest and Northern Mexico.

LR Press Release 03/02/01

Utah Environmental Leaders Launch Roadshow for River Restoration

CONTACT: Owen Lammers, 435-259-1063, mobile 435-260-2590 Denise Boggs
801-466-4055

Monday, March 5, 2001, 12:00 Noon US Bureau of Reclamation Regional Office
Federal Building 125 South State Street Salt Lake City

On the occasion of the 4th International Day of Action Against Dams and for River, Water and Life, Salt Lake City will host the kick-off event for the "Sustainable Water Project Tour," with a rally at the Regional Offices of the US Bureau of Reclamation at Noon.

Utah environmental leaders are inviting the public to join in calling on all federal, state and private agencies responsible for river management here in Utah to get serious about water conservation to enable river restoration. Water conservation donations will be sought for the Tour's empty tanker truck, which will then begin an 1,800-mile, restoration journey for dried-up rivers in the Southwest.

The Salt Lake rally is being sponsored by: Glen Canyon Action Network, Green Party of Utah, Sierra Club Glen Canyon Group, Southern Utah Wilderness Alliance, Sustainable Salt Lake, Terra Firma, Utah Animal Rights Coalition, Utah Environmental Congress, Utah Rivers Council, Western Wildlife Conservancy, Wild Utah Project and Willow Creek Ecology.

"We're starting at BuRec's regional headquarters because they, more than any other agency, dominate river destruction in the Southwest." says Glen Canyon Action Network President John Weisheit. "We and the ninety plus other environmental and social justice organizations from throughout the Southwest and Mexico supporting this tour want to see the Bureau of Reclamation transformed into the Bureau of Restoration."

Weisheit and his team will travel with their truck down the Colorado River watershed to a series of other events in New Mexico, Arizona and California. They will ultimately arrive at the US border with Mexico, where the drained-off Colorado River trickles into the sand. The environmental advocates will hold rallies at water agencies along the way. They will be presenting the agencies with letters asking them to voluntarily give back one percent of their Colorado River water, so that the river can once again replenish the dried-up delta.

Ken Sheehan, of the Utah Rivers Council says, "Whether it's the Colorado River Delta in Mexico, or the Bear River here in Utah, water needs to stay in our rivers. We don't need more dams, diversion or pipelines; a solid commitment toward water conservation will allow us to meet both human and environmental needs."

Utah is one of the most wasteful states when it comes to water consumption. According to the US Geological Survey, Utah uses 80% more water per capita than the national average. That's 7.5 more truck tankfulls of water per year for every Utahn above the

national average consumption rates. By implementing effective, mandatory water conservation and recycling programs, Utah households could not only cut their water consumption in half, but also free-up enough water to meet the immediate needs of the Colorado River delta.

"Many of Utah's watersheds are being rapidly degraded by logging and grazing practices that clearly are not sustainable," adds Denise Boggs, director of the Utah Environmental Congress, a co-sponsor of Monday's event. "We must also take care of the land, if we are to preserve our rivers."

The largest percentage of the water the Bureau of Reclamation gives away from western rivers is used to grow cattle feed. Cattle feed is the most water wasteful crop under cultivation. "This is nothing more than another subsidy to the livestock industry, at the expense of endangered species up and down our watersheds," says Eric Ward of the Utah Animal Rights Coalition. "We can grow 15 pounds of protein for human consumption with the same amount of water it takes to grow one pound of cow."

"Our rivers are ecosystems, not plumbing systems," concludes Weisheit. "It's time to revamp the mission of our water agencies from infrastructure developers that encourage more water waste, to conservation agencies that promote river and ecosystem health."

Too much town, not enough river Groups urge a rethink of the Colorado
By Heidi Walters

Uh oh, a little ice cream shop in Moab, Utah, is dishing out the dirt on us, telling people we're big fat water and power hogs.

Oh, that's not disturbing news?

Well, anyway, the Glen Canyon Action Network is a grassroots group who scoops out ice cream (it pays the rent) along with green propaganda to passing tourists (25,000 served last year), many who likely also visit Las Vegas. The Network formed a year ago to continue the decades-long fight to decommission Glen Canyon Dam, a "Bureau of Reclamation cash cow," the main useful function of which is lining the pockets of houseboat manufacturers, with minor functions of producing 3 percent of the Southwest's power and assisting a few private agribusinesses.

The Network also confronts the larger issue of the over-allocated Colorado River, which is diverted and dammed and polluted by the U.S. and only reaches its delta in Mexico, in the form of a toxic trickle, in flood years. So, the Network's spreading the news about greed- and growth-driven, river-sucking megaslops like us (and Phoenix and Tucson and Southern California etc.). They're telling the tourists that we've sent an ancient clam

in the Colorado River to possible extinction, that we drown rare birds, that we piss in our own drinking fountain, that we take water from small porpoises in Mexico, that we have huge evaporating fake lakes, subsidized water-wasting alfalfa fields, spouting fountains, lawns and gazillions of toilets and more, even though we're in a desert.

They're making us look bad, folks, evil. Oh, that's OK with you?

But here's the thing: They're not just sticking with the ice cream shop. They're bringing their act on the road. This month, the Sustainable Water Project Roadshow will haul an empty tanker truck, Native American drummers and environmentalists across the West, stopping along the way to enlighten citizens. They'll be in Las Vegas March 12, on the sidewalk by the Las Vegas Valley Water District at noon. (The district is not a sponsor of the tour.)

Oh, they'll keep it sweet, just like back home, but that's a sugar-sure tactic: People don't like to see dead porpoises and waterlogged wee birds, when it comes down to it. They'll sympathize. At least, that's the hope of the Action Network and the 37 other organizations in the United States and Mexico, representing eight million activists, who are sponsoring the tour.

"Politicians will ultimately react to what the public wants," says Action Network director, Owen Lammers. He notes, for example, that a number of Western politicians now agree that Glen Canyon Dam should come down.

Plus, the Network will tell people that to save these creatures is easy, a simple matter of water agencies in the Southwest donating 1 percent of the total Colorado River allocation, the minimal amount scientists say is needed to sustain the delta habitats.

It ain't much, says David Hogan of the Center for Biological Diversity, one of the groups involved. Hogan helped draft the groups' letter to river water users, which asks for a commitment to conserve enough water to send to the delta, and to forge a formal agreement with Mexico to assure that the water reaches the natural habitats (and is not, say, sucked up by agribusiness or municipalities across the border). The Center also is one of the litigants in a case in which they're seeking a ruling that the Endangered Species Act applies across the border in Mexico. Such a ruling, they hope, would result in mitigation that would entail an allocation of specific in-stream flows and flood flows for the delta. In the meantime, though, they've decided to try sweet talk to get the flows.

"I don't expect the water agencies will fall all over themselves to give the water," Hogan says. "But to ignore this reasonable plea would be at their expense. It makes them look like complete villains, to not commit to conservation."

Tracy Bower, of the Southern Nevada Water Authority which oversees local water districts, says her agency "has a pretty aggressive water conservation program" and does care about the environment. However, while the agency "recognizes [the delta is] an emerging issue," it won't commit to anything until the seven river basin states who rely on Colorado River water, and the Mexican governments, have sat down and talked about it. But what would actually prompt such a get together, she couldn't say.

The seven states have resisted recent attempts to help species in the Mexican delta, even trying to become interveners in the international ESA case (intervention was denied) and to stay the lawsuit (also denied, just a few weeks ago).

"Some of the river users are very nervous about any suggestion that they would relinquish a single drop of the water they're allocated," Orr says. "It goes against the tenet of Western water law: Use it or lose it. Western water law discourages conservation." What water they do conserve, he says, goes toward "fueling more development."

What the environmental groups are requesting—a change in the Law of the River—perhaps seems heretical to the states, who've had set (but mighty flexible) allocations since the 1922 Colorado River Compact, in which Arizona, California, New Mexico, Nevada, Utah, Wyoming and Colorado divvied up 15 million acre-feet (with Nevada, a small population back then, getting but 300,000 acre-feet). They tossed Mexico one-and-a-half MAF. The problem, which water users acknowledge today but treat as incidental, is that the total amount of water available was overestimated. The average annual flow is more like 13 MAF. That leaves 11 and-a-half MAF for the states, in reality, to divide. Subtract about two million more MAF of water that evaporates off Lake Mead and Lake Powell and seeps into reservoir sandstone, and the allocation is further reduced.

But that's just bad math on paper. On the ground, there's just lots of finagling. Some states have ended up using more than their allocation, and others have used only some. And they've been cutting deals to continue to move the water and imaginary water around. For instance, Nevada cut a deal where it can divert and store river water in aquifers in Arizona (long an under-user). The stored water becomes credit, which an entity can redeem later by using a portion of Arizona's river allocation while Arizona in turn feeds off the stored water. (One problem, Hogan says, is that Arizona doesn't store the water but instead pumps it, at taxpayers' expense, over 4,000-foot mountains to subsidize farmers...so will there be water to draw on later?) In another deal, last year seven states agreed to let California (long an over-user) reduce its river consumption by 1 MAF over 15 years, to bring it down to its allocation of 4.4 MAF. During this time, it can store water.

"The problem," says Orr, "is that they're going to draw down Lake Mead, which will allow them to catch floods. This is serious for the delta, because the only time water has gotten to the delta has been during floods. They call it 'administrative waste,' but there's been enough of it over the last 30 years that total ecological collapse has been avoided. And Bruce Babbitt just signed off on this, calling it a 'win-win' agreement, and the six states are just standing there with a lot of blue sky in their pockets."

The most egregious aspect of all of this water witchery, Orr says, is that the states pride themselves on conservation, but in fact they are only conserving water in order to fuel development, not to sustain ecosystems.

"Maybe we need to reexamine the whole Colorado River Compact," Orr says. "This is not a golden tablet. It's a law, and laws can be changed. Now it's a system that depends

on unsustainable growth and development" and agriculture (50 percent of the river water is used to grow alfalfa for cattle feed, even though these days much of our beef comes from South America).

Las Vegas, Orr says, ought to be concerned.

"At some point, growth and development in the Las Vegas Valley becomes similar to the biology of the cancer cell; you can only grow so far until you crater out." Las Vegas is particularly vulnerable, he says, because it "has really hitched its wagon to a global growth machine, and its fortunes will rise and fall based on the world's perception of Las Vegas...and also on whether people can afford to come stay there."

Although this tour is non-confrontational, Orr says the groups are considering "the possibility of taking the federal government to court" over the delta.

Who wants ice cream?

The Sustainable Water Project Tour:

March 5 - 14, 2001 Salt Lake City, Albuquerque, Phoenix, Las Vegas, Blythe, Los Angeles, and many stops in between.

* Itinerary as of March 2, 2001 * Letter to Bureau of Reclamation * Tour Day 1 * Tour Day 2 * Tour Day 3 * Tour Day 4 * Tour Day 8 * Tour Day 9 * Tour Day 10 * Tour Day 11 * Salt Lake Tribune--3/6 * Grist Magazine--3/5 * ENN: Greens want Colorado River ecosystem restored--3/8 * UNLV: Roadshow tours to revive delta * AZ Rep: Truckin' for the Environment--3/10 * LV CityLife: Too much town, not enough river--3/1 * Tour Media Advisory * Media Advisory for Salt Lake Launch--3/5 * Media Advisory for Albuquerque Stop--3/7 * Media Advisory for Phoenix Stop--3/8 * Media Advisory for Las Vegas Stop--3/12 * Media Advisory for Los Angeles Stop--3/14 * Major Event schedule * Map of the Colorado River Basin. Includes tributaries, reservoirs and diversions * List of supporters

Festivals and Rallies for Water Conservation and River Restoration

The mighty Colorado River no longer reaches the sea. Stretches of the Rio Grande are dry for months at a time; its terminus is a toxic soup. International treasures like the Grand Canyon National Park, Dinosaur National Monument and Colorado River delta are starving for natural river flows.

Politics and concrete are killing these rivers, and the agencies responsible want you to believe that there's no water to spare. Yet billions of gallons of subsidized water flow off industrial hay fields, tumble over desert fountains, or evaporate off water ski parks. Water agency policies of consumption and waste, revenue and profits, have perpetuated a mythical water crisis that must now come to end.

Much of this water can stay in our rivers. Dams can come down. Habitats can be revived. And still, human needs for water can be met now, and for generations to come. Water conservation leads to river restoration. Lend your voice to make this happen.

Rally in support of a living Colorado, Rio Grande and other rivers everywhere. Call for an end to polluting, wasteful and subsidized irrigation practices. Support calls for water efficient, organic farming. Demand municipal water and land use policies that mandate conservation, native landscaping and urban biodiversity. Tell these water agencies that their missions are to meet human needs by taking progressively less, not more, water from our rivers. Let the river flow to the sea!

Join Vaquita Rescue, the Tour's water truck, as it takes collections to deliver fresh water to the endangered vaquita porpoises in the Gulf of California, and to the endangered species of the Colorado River delta. This rolling water tank also symbolizes the hundreds of millions of similar-sized tanks of water wasted by municipal and agricultural water agencies; water that never reaches the Colorado's dry and dying delta, and estuary.

Join us as we stop at the headquarters of the major water abusers in the seven-state Basin and ask them to institute conservation programs and "Giveback Less than 1%" of their total allocation to restore the Colorado Delta.

Partial List of Events - Check regularly for updates

Monday, March 5, Salt Lake City, UT, 12:00 Noon Kick-off Rally for the Bureau of Restoration US Bureau of Reclamation Regional Office Federal Building, downtown Salt Lake City

- * Call for federally mandated conservation measures for Colorado River water agencies
- * End water abuse by the Central Utah Project
- * Protest the proposed St. George pipeline from Lake Powell

Wednesday, March 7, Albuquerque, NM, 12:00 Noon Re-water the Rio Grande & Colorado rivers Albuquerque City Hall

- * Demand that the City of Albuquerque protect instream flows of the Rio Grande River
- * Demand a watershed study for radioactive contaminants from Los Alamos
- * Save the silvery minnow

Friday, March 9, Phoenix, AZ, 10:30 a.m. Arizona State Department of Agriculture 1688 W. Washington (NE corner of Washington and 17th Ave.) Simple lunch fare will be provided

- * Ask Central Arizona Project to "Giveback Just 1%" of its water allocation to restore the Colorado Delta.
- * Protest the needless diversion of Colorado River water for wasteful desert irrigation.
- * Oppose proposed pipeline from Lake Powell to Flagstaff
- * Tell CAP Tucson doesn't want its polluted sprawl-enabling water

Monday, March 12, Las Vegas, NV, 12:00 Noon Stop Gambling with the Colorado River Rally outside the Southern Nevada Water Authority & Las Vegas Valley Water District Headquarters

* Mandate xeriscape gardening for Nevada * No more fountains and artificial lakes in desert * Ante-up for delta preservation

Tuesday, March 13, Blythe, CA, 4:30 p.m. Appropriate Agriculture and Energy Policy for the Colorado Todd Park, near City Hall

* Protest corporate welfare and agricultural waste of the Colorado River * Support farmworker rights, organic farmers and family farms * Protest plans for the Palo Verde power plant Wednesday, March 14, Los Angeles, CA, 12:00 Noon 4th International Day of Action Against Dams and for Rivers Water and Life The Old Plaza across from Metropolitan Water District Headquarters

* Demand conservation policies for the regions 17 million Colorado River water recipients * Support natural flows for the restoration of the Colorado River delta and Gulf of California * Stop the Eastside Reservoir boondoggle

Moab Times Independent

Enthusiastic crowd supports group whose mission it is to drain lake Participants gear toward March 14 rally

By Kathryn Wilder, Guest Writer

The Glen Canyon Action Network, which officially came into being on Jan.1, hosted its first public event on Monday, Jan. 24: River Revival Night and Hot Fudge Monday Feed.

Despite being a sleepy little town in the depths of the winter lull, Moab and Castle Valley turned out nearly 150 residents to pack the hall. They were joined by visitors from the Salt Lake area; Monticello; Durango, Colo.; and as far away as Prescott, Ariz.

Susette Weisheit, campaign committee chair for the group, was master of ceremonies. She introduced the Glen Canyon Action Network to the Moab community, talked about the upcoming Day of Action rally at Glen Canyon Dam March 14, and introduced each of the evening's speakers.

GCAN's executive director Owen Lammers spoke of the efforts and accomplishments of the international river advocacy movement, highlighted by the annual world-wide Day of Action Against Dams and for Rivers, Water, and Life. The March Restoration Celebration and Rendezvous at Glen Canyon Dam will be a leader in this 3rd annual event. Lammers' slide presentation pictured other dams in other countries where people are fighting to free the rivers.

The featured speaker of the night, longtime river runner and outfitter Ken Sleight, told tales of the Glen Canyon that he and other early river runners knew so well. He spoke of watching side canyons fill and tributaries fall mute, of watching lizards float by on pieces of driftwood, as the water level rose with the closing of the gates of Glen Canyon Dam in 1963.

"It made an environmentalist out of me," Sleight said.

He told numerous stories of his protests against the dam and the varieties of resistance he met from law officers and park officials. Despite the many obstacles thrown in his path, for nearly 40 years Sleight has persevered in his efforts to restore Glen Canyon.

Another old-time river runner made an appearance at GCAN's River Revival Night. Kent Frost, who first floated the Colorado River through Glen Canyon in the 1930s, donated a box of his books, *My Canyonlands*, and was available to sign them. Back of Beyond Bookstore also came out to support GCAN's efforts through book sales.

When asked by a member of the standing-room-only crowd what activists for the cause can do now, Sleight mentioned other organizations that are working to restore Glen Canyon, such as the Sierra Club and Glen Canyon Institute. "Hop on," Sleight said, "and, most importantly, show up at the Dam on March 14th!"

17th annual Fordham Debate considers Glen Canyon Dam decommissioning

- M E D I A A D V I S O R Y -
GLEN CANYON ACTION NETWORK

January 24, 2001

CONTACT: David Orr 435-259-1063 Owen Lammers 435-259-1063

17th Annual Fordham Debate considers Glen Canyon Dam Decommissioning

The prestigious 17th Annual Jefferson B. Fordham Debate at the University of Utah Law School will be the setting for a debate over the proposal to restore a free-flowing river through Glen Canyon on the Colorado.

River restoration advocates from Glen Canyon Action Network in Moab, and Glen Canyon Institute in Flagstaff, Arizona, will debate representatives from the United States

Bureau of Reclamation and the Upper Colorado River Basin Commission. The event will take place at 6:30 PM, Thursday, January 25, in the Law School's Moot Courtroom.

"It's not a matter of if Lake Powell will be drained, but when," said David Orr, Director of Field Programs at Glen Canyon Action Network (GCAN) in Moab, and a participant in Thursday's debate. "It's sheer economics: do we pay to clean up the mess now or pay more to do it later?"

Glen Canyon Action Network is challenging the Bureau of Reclamation over its Colorado River management practices. GCAN will launch its "Sustainable Water Project" tour of the Southwest from Salt Lake City on March 5, to call attention to the desperate need for water to restore the Colorado River's dying delta in Mexico. [For further information, consult GCAN's website at www.drainit.org.]

In recent months, GCAN has called for a dam decommissioning study to be conducted at Flaming Gorge Dam to address endangered species concerns there.

In concert with Native Americans and other environmental groups, GCAN is challenging on environmental and cultural grounds a proposal by the National Park Service to construct a major new marina project on Lake Powell reservoir at Antelope Point.

GCAN and other groups are demonstrating that sediment problems at the reservoir are already impacting recreational boating, a problem that will only worsen until the dam is eventually decommissioned.

On its tour in March, GCAN will be visiting major users of Colorado River water, asking for voluntary donations of "One Percent for the Delta," a reference to scientists' calls for assured flows to the river's parched estuarine region, where several species are currently threatened with extinction. GCAN and other groups are supporting proposals for binational talks between the US and Mexico to reach agreement on delta restoration.

Orr noted that draining Lake Powell and restoring a free-flowing river through Glen Canyon, will save huge amounts of water--enough to supply the City of Los Angeles for a year--water that currently evaporate into the desert skies over southern Utah.

"A gallon saved from Lake Powell is a gallon earned for the delta downstream," said Orr. "Ignoring the problems we are seeing--sediment, endangered species, water pollution, and evaporation--will not make them go away; the remedy just becomes more expensive the longer we wait."

LR Letter 01/14/02

To GCNRA/BuRec: Sediment management for Lake Powell reservoir

Superintendent Kitty Roberts
Glen Canyon National Recreation Area
P.O. Box 1507
691 Scenic View Road
Page, AZ 86040-1507

Re: Development Concept Plan (DCP) for Hite Marina and Sediment Management Plan for Glen Canyon National Recreation Area (GCNRA)

Dear Ms. Roberts:

Living Rivers and the eight undersigned groups submit the following comments pertaining to the DCP at Hite Marina. Our concerns with the proposed Plan are threefold.

- 1) The Plan must give sufficient consideration to impacts of sediment on the continued operations and future development in and around Hite Marina.
- 2) Because sediment accumulation is a growing concern, not only at Hite Marina but elsewhere on the reservoir, and at Glen Canyon Dam, GCNRA, in conjunction with other management agencies, should first complete a comprehensive sediment management plan for the reservoir. Such a study must assess the operational life span of GCNRA's reservoir activities as dictated by sediment impacts on the operation of Glen Canyon Dam.
- 3) The prioritization by GCNRA to move forward on the Hite Marina DCP demonstrates a bias toward further accommodation of one form of recreation, namely those employing motorized reservoir watercraft, while continuing to ignore the concerns being raised by those utilizing GCNRA river corridors.

INTRODUCTION

It is encouraging that the outline for the DCP makes reference to sediment mitigation at Hite Marina. For this to be properly addressed GCNRA must first ensure that all potential inflows, not just the Colorado's main stem but the Dirty Devil, Escalante, and San Juan rivers, are evaluated. This includes the numerous, ephemeral side-canyons of the reservoir too. It is also critical that GCNRA work with the Bureau of Reclamation (BuRec) to incorporate potential changes in dam operations that will affect sediment mobilization and the impacts they will have at Hite Bay. This should include dam operations affected by climate, as well as those associated with other management plans such as the Interim Surplus Criteria (ISC).

Sediment mitigation is not solely an issue at Hite Marina, but an unavoidable problem throughout the NRA. Sediment in Lake Powell reservoir was anticipated when Glen Canyon Dam was built and when the NRA became operational. Now that sediment impacts are becoming more commonplace, it's critical that GCNRA coordinate with other agencies within the Department the Interior (DOI) to prepare a comprehensive Sediment Management Plan and associated EIS for its implementation. This must be completed prior to any further work on the Hite Marina DCP, as its findings will directly inform development options for the area.

In the past, concerns with regard to sediment management have been raised by Living Rivers and others in the context of impaired access for river users at GCNRA, especially along the San Juan arm. Although staff from GCNRA has participated in several meetings, GCNRA has made no commitment to address this matter of growing public safety, health and access. GCNRA, however, is investing significant resources in moving forward on the DCP for Hite Marina, principally to benefit motorized recreation on Lake Powell reservoir. GCNRA should be working to ensure maintaining access for all existing users first. It should not be investing in expansion plans for one group of users, while ignoring those issues that are impeding access for others. Work on the DCP for Hite Marina should be suspended until GCNRA has mitigated the sediment problem along the San Juan arm of the reservoir.

BACKGROUND

The construction of Glen Canyon Dam began in 1957 and the impoundment of Colorado River water at Glen Canyon began in 1963. The reservoir reached an appropriate elevation to generate electricity in 1964. The Bureau of Reclamation (BuRec) manages the operation of the dam, power plant and reservoir. In 1972 Congress created GCNRA to manage the recreation and natural resources in the Glen Canyon region, including Rainbow Bridge National Monument. The Navajo Nation manages the resources south of the San Juan River and the Corps of Engineers regulates the waterways (Section 404 of the Clean Water Act).

The Colorado River is famous for its suspended sediment load. In 1925 testimony was presented before a Senate committee stating that the "Colorado has a silt content three times that of the Ganges and ten times that of the Nile. With the possible exception of the Tigris, it is the greatest silt-bearing stream in the world (*The Boulder Canyon Project* by Paul L. Kleinsorge)." This quantity of sediment is one of the two reasons why Hoover Dam was built. The other was to store water for consumptive use by agriculture interests downstream.

According to the *Weymouth Report* of 1929 (Senate Document #186, 70th Congress), the total suspended sediment load for Lake Mead reservoir created by the Boulder Canyon Project would amount to 137,000 acre-feet per year. Weymouth predicted that a sediment plug would ultimately form before the dam face that would compromise the dam's generator penstocks after 50 years (1985) of impounding the Colorado River. Such sediment mitigation has now been pre-empted and transferred upstream to Glen Canyon Dam.

A report published in 1961 by Ernest R. Schultz of BuRec titled *Design Features of Glen Canyon*, states that sediment mitigation at Glen Canyon Dam would need to be underway within 100 years of impoundment (2063), as sediment levels would reach the four bypass tubes necessary for emergency releases. Once sediment exceeds this level the dam and reservoir will need to be decommissioned to avoid compromising public safety. Despite this inevitability, and the impact it would have on recreation at GCNRA, no sediment management plan has been conducted for the reservoir area or dam operations. As noted below, sediment management is already becoming a major problem in the San Juan arm of the reservoir.

The only substantive work done to date by BuRec for sedimentation was conducted 15 years ago, *The 1986 Lake Powell Survey*. Although the data for this report is instructive, its conclusions are meaningless. The report states that the reservoir would completely fill with sediment by the year 2663 (700 years). As Weymouth stated for Hoover Dam, and Schultz for Glen Canyon Dam, accumulate sediment will eventually compromise the function and safety of the dams long before there is any chance that their reservoirs could actually fill with sediment. It's imperative that BuRec first determine when sediment accumulation will compromise the operation of Glen Canyon Dam so that other managing agencies, such as GCNRA, can better implement their own management plans, such as that for Hite Marina.

A technical memorandum was provided by Mussetter Engineering, Inc., on May 21, 2001 concerning sediment aggradation specific to the DCP for Hite Marina. The collection of data was completed in March of 2000 and included a reach on the Colorado River arm from ten miles upstream of the Dirty Devil River to .8 miles below North Wash, and a reach on the Dirty Devil arm ten miles above its confluence with the Colorado River arm. The data does not include a sediment study of North Wash Bay, which was also not collected during the BuRec 1986 sediment survey.

The memo states that the delta foreset slope will pass the boat ramp at Hite Marina by the year 2003. It also states the top of the delta builds up at a much slower rate and suggested that sediment would not impact access to the boat ramp for 35 to 40 years. However, the authors of the memo acknowledged that the results of their study did not include such variables as high volume freshets (for example, the freshets of 1983 and 1984), nor the mobilization of upstream sediments due to a lower reservoir pool as experienced between July 1990 and April 1993.

The authors calculated that by year 2003, the bottom of the bay before the Hite boat ramp would be 3630 feet. As of this writing the reservoir's elevation is currently 3660 feet. In April of 1993, the reservoir's elevation was 3610 feet. If such a scenario were to repeat itself, access to the boat ramp at Hite Marina would be completely cut-off in as little as two years.

HITE MARINA

BuRec's 1986 sediment survey provides some useful, though somewhat out of date, data to quantitatively evaluate the current rate in which the reservoir's deltas expand and encroach upon recreational infrastructure. The survey data would indicate that the

Colorado River delta has now progressed into the bay at Hite Marina and that the Dirty Devil River arm is completely filled. Recent observations confirm that the tributary streams above Hite Marina, such as Gypsum, Dark and Clearwater canyons are also completely filled.

Unfortunately the report's data for sediment content in North Wash Bay is incomplete and should be gathered prior to any management decisions are taken for Hite Marina. This area drains a large area of soft Mesozoic host rocks that are allowing a sediment plug to form and encroach on the area just below Hite Marina. Over time, or in the case of one significant dump, sediment from North Wash will cause access to Hite Marine to be cut off by impeding the flows of sediment coming in from upstream. A similar problem at Hite would occur when the Dirty Devil River arm, completely full of sediment, ultimately deposits its contents into the reservoir.

A more immediate challenge is that the existing sediment plug from the Dirty Devil will cut off access to the existing camp developments in the area, as dam operations force the reservoir to drop. Lower reservoir pools are likely to become commonplace, especially over the medium term, with the implementation of the Interim Surplus Criteria. To meet ISC guidelines, Lake Powell reservoir will be drawn down more frequently to assist California with its off-stream storage plans. This is likely to be exacerbated by lower than expected precipitation patterns, and higher water utilization in the Lower Basin as is predicted by the Global Change Research Program.

Lower reservoir pools will significantly aggravate existing problems for river runners, which have historical precedence in the use of the recreational resources at Hite. It is already difficult to locate safe camps below Rapid #26 (Ten Cent). Popular hikes such as those conducted at Gypsum, Clearwater and Dark canyons on the Colorado River arm are very problematic because unconsolidated sediment restricts safe access, especially when liquefied. When the river incises the sediment at depth, such as what occurred in lower Cataract Canyon in 1992, hiking access is restricted due to unstable slopes of about 30 degrees. These impacts degrade the full value of the river trip experience and the associated financial commitment necessary to engage in such activities.

Such reservoir operations and sediment (mis) management issues have caused significant problems for Colorado River users at Pearce's Ferry on Lake Mead National Recreation Area (LMNRA). The low reservoir levels at Lake Mead, accompanied by the buildup of silt from the Colorado River above, made boating activities increasingly dangerous there this past season and forced the LMNRA to implement an emergency closure of the launch ramp.

Located near the top of the reservoir, Hite Bay will be one of the reservoir's first facilities to be inundated with sediment. How this will be managed, and how long before sediment will force its permanent closure must be addressed by the DCP to evaluate the merits of any additional capital expenditures. Furthermore, the DCP cannot strictly focus on the marina facility itself, but must develop plans to assure access for river

runners, hikers and other users of the river corridors and side canyons in GCNRA's jurisdiction above the bay at Hite.

CLAY HILLS

Another immediate and ongoing sediment management problem for GCNRA exists along the reservoir's San Juan arm. The San Juan River is the greatest single contributor of sediment to the Colorado River system. Historically, the San Juan River provided 15 percent of the Colorado River's annual flow and 35 percent of the sediment. The 1986 sediment survey indicates that the San Juan delta in Lake Powell reservoir is progressing at a rate of about 10% less than that from the Colorado River. Since the 1986 survey, the access at Piute Farms has been completely eliminated and has disenfranchised the Navajo Nation from generating revenue at that locality.

The access problem at Clay Hills Crossing is especially acute. When the San Juan River is low, access to the take-out is dependent on where the river channel is. Sometimes the river flows directly to the access ramp and sometimes it does not. River channels naturally migrate and abrade over sediment fill. When the channel migrates to the opposing side of the take-out, conditions mandate that the boaters physically carry gear and boats across the sediment. Such a task is unsafe due to the quicksand-like consistency. Senior citizens and disabled people especially experience difficulties with such a circumstance.

Another sediment-related problem occurs below Clay Hills Crossing when the reservoir is at low pool. Specifically, a waterfall emerges impeding further passage downstream. In 1992 the vertical drop at this waterfall was approximately 35 feet. The waterfall is a safety consideration to boaters and needs to be addressed in a more substantive way than a warning sign or educational brochure.

The eventual desiccation of the perched delta will cause the elimination of access to the boat ramp at Clay Hills. When the river channel at the waterfall migrates down the bedrock slope, it will excavate down into the delta and the river's gradient upstream will increase. When this occurs a deep, canyon-like slope of sediment will result at the boat ramp and extensive mitigation will be required. This will be costly and likely involves management decisions in consultation with the Army Corps of Engineers.

Gene Stevenson, a consulting geologist, outlined this problem to GCNRA staff in November of 2000 in Monticello, Utah, and in January 2001 in Page, Arizona. Mr. Stevenson also informed attendees that the San Juan delta was mobilized in 1983 and 1984, and deposited sediment as pulses into Zahn's Bay (40 miles from the confluence). The floods of 1983 and 1984 too contributed generous, fresh sediment in to the San Juan delta system.

At the Page meeting of January, 2001, GCNRA staff also heard from Dr. John Dohrenwend, a retired USGS surficial geologist. He displayed satellite image maps and explained that sediment has been accumulating in the arroyos and tributary stream channels of the San Juan River basin since the early 1940s. He explained that this is a natural occurring process for rivers in arid and semi-arid areas. For southern Colorado

Plateau streams, this period of aggradation is very likely the result of a decrease in peak-flood discharge from these tributaries. At some point in the future, a regional climatic shift to more intense and frequent flood events will very likely occur. When intense storms return to the San Juan basin, the sediment deposits stored in the aggraded stream channels will be mobilized and carried into the main stem river system. Such a climatic shift could dump more sediment into the reservoir than what has occurred since Glen Canyon began filling in 1963.

Lake Powell reservoir inundates a total of 71 miles of the San Juan River canyon and its delta may soon reach its confluence with the Colorado. Because of San Juan sediment, mitigation pertaining to dam operations may be required prior to the period projected by Schultz in 1961. When the San Juan River sediment reaches the Colorado River confluence, it will effectively divide the main stem reservoir in half. During times of progressive down draw, this sediment plug will effectively leave the upstream half of the reservoir perched. Once formed, a breach of this plug would jeopardize GCNRA and BuRec infrastructures and could result in loss of life.

OTHER GCNRA DEVELOPMENTS

Another anticipated problem concerning sediment in the reservoir will occur for the facilities at **Bullfrog Bay**. Hall's and Bullfrog creeks have extensive watersheds in soft Mesozoic host rocks that have the potential to send massive sediment pulses into their respective bays after a significant meteorological event(s). The access road (531) that crosses Bullfrog Creek is underwater when the reservoir is at full pool. Sediment deposition from Bullfrog Creek will impact this access road in the coming years. This area has camp facilities at the head of the bay where Bullfrog Creek drains into the reservoir. Access to these facilities will also be impacted by reservoir sediment filling. The sediment plug will also eventually reach the marina and the ferry terminus.

Access to **Rainbow Bridge** National Monument (RBNM) will also be compromised when a sediment pulse occurs at Bridge and/or Aztec canyons. These watersheds originate in the Navajo Mountain watershed. More importantly, as Rainbow Bridge is a sacred site of the Navajo people, it would also be appropriate to include their spiritual elders in the processing of a sediment management plan. According to Executive Order 13007, the mandate for national agencies to do so is actually quite specific.

Though **Antelope Point** and **Wahweap Marina** are distanced from the Colorado and San Juan deltas, these boat launches too will be affected by sediment deposition from local tributary streams, compounded by the underwater turbidity flows that are currently building before the face of Glen Canyon Dam. The depth of Wahweap Bay averages about 230 feet and Wahweap Creek is an extensive watershed that drains soft Mesozoic strata from the Kaiparowits Plateau.

Antelope Point is located next to the original Glen Canyon gorge, which is about 530 feet deep when the reservoir is at full pool. However, the reservoir is quite narrow at this location and does not have an abundant storage capacity for sediment. Antelope Point lies between two drainages, Navajo Creek and Antelope Canyon, which drain large areas of soft Mesozoic rocks. These drainages already have progressive deltas building

within their respective gorges. In 1997 a sediment pulse killed eleven visitors hiking in Antelope Canyon.

SEDIMENT MANAGEMENT PLAN

In conjunction with their General Management Plan, NPS entities often prepare more specialized management plans for issues specific to the natural environment and uses in a particular park, monument, or recreation area. As sediment is a major issue affecting present access in GCNRA, and ultimately the life span of much of its operations, it's vital that the agency undertake the preparation of a Sediment Management Plan as a component to its General Management Plan.

The study should be undertaken in partnership with BuRec, which itself has been delinquent in preparing a plan for addressing the impact of sediment on Glen Canyon Dam operations. The chief concerns in this regard are, one, that sediment storage displaces water storage capacity, and two, turbidity flows transports sediment before the dam's face. Displacement of water storage will stress the emergency spill criteria of the dam and turbidity flows will stress the mechanics of the emergency bypass tubes and power generation penstocks. Studies to date have not addressed how these problems are to be mitigated, despite representing a significant risks to dam operations. BuRec, should determine when and how such mitigation plans are to be implemented so that other management agencies, such as GCNRA, can develop their own management criteria.

In undertaking this work, it is vital that management agencies not focus merely on short-term trends. During the past 10,000 years, river valleys on the Colorado Plateau have experienced cycles of erosion and deposition having periods of decades to centuries. These pulses of cutting and filling are considered by most researchers to be closely related to the frequency and magnitude of large storms (100 year to 500 year flood events). Therefore the 40 to 50 year record of sedimentation in reservoirs, such as Lake Powell, are not necessarily an adequate basis for calculations of the rates and magnitude of sedimentation within these reservoirs, and for estimating the remaining useful lives of these reservoirs. Moreover, significant climate change is anticipated to occur during the next 100 years, and it is unresolved whether this climate change will bring larger and more frequent large storms (major floods) to the Colorado Plateau.

To this end, the plan must:

- 1) Determine the present distribution and thickness of sediment in Lake Powell and quantitatively compare these deposits with the 1986 sediment survey.
- 2) Contain detailed and consistent surficial geologic and geomorphic mapping and analysis of all Holocene deposits within the major watersheds tributary to Lake Powell.
- 3) Provide an updated analyses of sediment delivery to the reservoir via the main stem Colorado upstream of Hite and the San Juan River..
- 4) Estimate near term climate change on the Colorado Plateau (with special emphasis on the probabilities of significant changes in the frequency and magnitude of large

storms; and estimate the potential impact of such changes on the possible mobilization of sediment deposits presently stored on the hillslopes, piedmonts, floodplains and river channels of the region.

5) Synthesize (and evaluate) all of the above with respect to potential sediment delivery to and deposition within Lake Powell.

Additionally, the plan must address water quality issues. When the river begins to cut into the sediment, it mobilizes heavy metals and toxins that originate from upstream industrial and agricultural activities. This includes toxins, which erode naturally from the host rocks upstream, such as uranium and selenium. Currently GCNRA does not have a management plan to address such potential human and animal health problems.

CONCLUSION

Lake Powell reservoir is a trap for sediment transported by the Green, Colorado, Dirty Devil, Escalante, and San Juan rivers (including numerous local side canyons). Hite Marina's future will be significantly impacted by ongoing sediment deposition, as will most of the development and recreational opportunities within GCNRA. Ultimately, as Schultz alluded to, increasing sediment accumulation in the reservoir will eventually force BuRec to make management decisions to address public safety problems associated with Glen Canyon Dam operations. These decisions will have a profound affect on the recreational infrastructures at GCNRA. It's critical that GCNRA address these issue directly, and prepare a management plan to guide its planning decisions as the reservoir continues to fill with sediment. We believe that the preparation of such a plan should take precedence over the completion of the Hite DCP, as the findings will inform future management challenges in the bay of Hite.

GCNRA should also direct immediate resources to address the existing sediment induced access problems at Clay Hills and elsewhere. This matter has been brought to your agency's attention in the past, yet no action has been taken. GCNRA is, however, proceeding with a variety of studies, such as the Hite DCP, Antelope Point EA and Wahweap DCP principally to benefit motorized users of the reservoir. The San Juan and Colorado River arms of the reservoir are also in the GCNRA's jurisdiction, and are used extensively by river runners.

We are concerned that GCNRA is displaying a culture of general avoidance to address the geologic processes concerning the public lands within its jurisdiction, as well as a preference for expanding services for high-speed recreation as opposed to river users.

We look forward to working with you to remedy this situation, and to ensure equitable and safe access for all visitors to the NRA.

Sincerely yours,

Sediment Problems: Beginning of the End for Lake Powell

**Park Service, BuRec fail to address Lake Powell's growing sediment problems;
Rafting industry and environmentalists issue urgent call for action**

**World-famous Cataract Canyon and San Juan River trips threatened; Hite Marina
will be rendered useless**

MOAB, UTAH (Jan. 14) -- It's official: Lake Powell Reservoir is filling with sediment. And the government had better start dealing with it.

So says a [letter](#) sent today by LIVING RIVERS and eight other river protection and recreation organizations, to the National Park Service (NPS), calling for federal action to address the growing problem of river mud that is interfering with boating activities in the upper reaches of the nation's second-largest artificial lake. The Utah Guides & Outfitters Association, a recreational industry trade group, made the same points in a concurring letter.

"This is the beginning of the end for Lake Powell," said John Weisheit, LIVING RIVERS conservation director and a professional river guide with 17 years experience. "People talk about Lake Powell filling with silt sometime in the future, but the future is now."

Of immediate concern is the slimy muck that threatens the environment and the Colorado Plateau's multimillion-dollar recreational river rafting industry. Similar impacts are being felt today in the Grand Canyon far downstream, where in summer 2001 the Pearce's Ferry take-out was closed indefinitely due to thick layers of oozing sediment clogging the upper reach of Lake Mead Reservoir.

The groups' letters were sent in response to a NPS redevelopment proposal for Hite Marina, a commercial concession within Glen Canyon National Recreation Area (GCNRA), located in San Juan County, Utah. The coalition of groups and businesses is asking for the marina project to be put on hold pending a study of sediment-caused access problems, not only for boaters on the reservoir but also for rafters using the Colorado River's Cataract Canyon and the lower canyons of the San Juan River. Whitewater trips through both canyons terminate on Lake Powell Reservoir.

This is the first serious indication of problems that will inevitably worsen in the coming years. Prudent management compels the Park Service to undertake a comprehensive sediment study prior to investing more public funds on infrastructure that sediment deposition will ultimately render useless. The agency has a legal duty to prevent impairment of park resources and provide high-quality recreational opportunities, yet the Park Service emphasizes reservoir-based, flat water recreation to the detriment of maintaining a world-renowned rafting experience. An industry that not only predates the reservoir's existence but also employs hundreds of people is dependent on maintaining an open channel from the mouth of Cataract to the take-out at Hite Marina, and from the lower San Juan to Clay Hills Crossing on the reservoir's San Juan arm.

"People have been using these rivers for recreation since the 1920s," said Bob Jones, owner of Tag-A-Long Expeditions, the oldest river outfitting company in Moab. Jones is a member of Utah Guides & Outfitters Association. "Something has to be done about this access problem at Clay Hills, and now I am very worried that my business will be impacted by the problems I see coming for Hite Marina. Our customers come from all over the world, and I sure would hate to disappoint them."

LIVING RIVERS' letter warns that access problems already exist at Clay Hills Crossing, and that access to Hite Marina could begin to be curtailed by sediment in as little as two

years. Colorado River sediments are quickly filling the bay at Hite and may soon inhibit access to the marina, the terminus for all Cataract Canyon trips.

"We're losing two of the country's most spectacular whitewater boating experiences," stated Annie Payne, President of Colorado Plateau River Guides. "The Park Service and Bureau of Reclamation have ignored the situation in the past, but it won't go away; it just gets worse each passing year."

The Park Service, in its 1979 General Management Plan for GCNRA, estimated that Hite Marina would have to be abandoned "within thirty years" because of sediment accumulation. The silt arrived ahead of schedule. But despite this predicted event, the agency is moving forward with plans to redevelop the existing marina at its current site.

Sedimentation occurs in all reservoirs, but the problem at Powell is particularly acute, say the groups. The extraordinarily high silt loads carried by the San Juan and Colorado Rivers are the result of the region's unique geology. Geologists consider the soils to be among the fastest eroding in the world. Flash floods, common occurrences during the desert's hot summers, carry huge quantities of silt and debris into surging streams. When these sediment-laden waters reach the still waters of Lake Powell Reservoir, the particles settle out and form unsightly mudflats that at lower water levels can make boat travel impossible.

Today's letter requests the Park Service to work with the Bureau of Reclamation to develop the requested plan and an environmental impact statement. Both agencies have responsibility for managing public resources and facilities safely and economically, and for encouraging public participation in addressing any problems. Yet they have failed to inform the public of the inevitable--and worsening--conflicts and damage that will occur.

According to a recent [NPS-sponsored study](#) [20k PDF File], the sediment deposit is quickly advancing toward Hite, and will make the launch ramp there inaccessible within two years whenever the reservoir surface level falls to 3630 feet above sea level. In 1992, the reservoir dropped to about 3610 feet above sea level. The current level is 3660 feet above sea level.

Sediment at Clay Hills Crossing is already impacting recreational usage. Boaters must often lift and carry their boats and equipment across quicksand-like mud flats to the take-out, creating unsafe conditions for recreationists.

"There's nothing much they can do but attempt to manage this problem in the near term, but in the long term, decommissioning Glen Canyon Dam is inevitable," said Weisheit.

Silt threatens Lake Powell, lucrative rafting industry

By MICHAEL C. BENDER The Daily Sentinel

Lake Powell is filling with sediment and soon will have to be decommissioned, according to a letter sent Monday from nine river protection and recreation groups to the National Park Service.

"This is the beginning of the end for Lake Powell," said John Weisheit, Living Rivers conservation director. "People talk about Lake Powell filling with silt sometime in the future, but the future is now."

The river groups' letter was sent in response to a National Park Service redevelopment proposal for Hite Marina. The groups are asking for the marina project to be put on hold pending a study of sediment-caused access problems.

A spokeswoman for the Glen Canyon National Recreation Area did not return phone calls.

The river groups point to a "slimy muck that threatens the environment and the Colorado Plateau's multimillion-dollar recreation river-rafting industry."

The letter says that access problems already exist at Clay Hills Crossing and that access to Hite Marina could begin to be curtailed by sediment in two years.

The letter also says that the park service is ignoring its 1979 General Management Plan for Glen Canyon National Recreation Area.

That plan, the group says, "estimated that Hite Marina would have to be abandoned within 30 years because of sediment accumulation."

The silt, the groups say, has arrived ahead of schedule.

The groups say silt impacts are being felt downstream in the Grand Canyon, where in summer 2001 the Pearce's Ferry take-out was closed indefinitely "due to thick layers of oozing sediment clogging the upper reach of Lake Mead Reservoir."

"Prudent management compels the park service to undertake a comprehensive study prior to investing more public funds on infrastructure that sediment deposition will ultimately render useless," Weisheit said.

The groups point out that they represent an industry that predates the reservoir and one that employs hundreds of people dependent on maintaining an open channel from the mouth of Cataract to the take-out at Hite Marina and from the lower San Juan to Clay Hills Crossing on the reservoir's San Juan arm.

"People have been using these rivers for recreation since the 1920s," said Bob Jones, owner of Tag-A-Long Expeditions, the oldest outfitting company in Moab.

"Something has to be done about this access problem at Clay Hills and now I am very worried that my business will be impacted by the problems I see coming for Hite Marina."

Sedimentation occurs in all reservoirs, but the problem at Lake Powell is particularly acute, the groups say.

"There's nothing much they can do but attempt to manage this problem in the near term," Weisheit said. "But in the long term, decommissioning Glen Canyon Dam is inevitable."

Canyon changes are crucial by Lisa Force

Arizona Republic

This week, government officials, scientists and others will gather in Phoenix to flutter and fuss around the sickbed of Adaptive Management, the program implemented in 1996 that was supposed to save the Grand Canyon.

The program turned 5 years old last October, but no one celebrated because despite infusions of nearly \$40 million, the program is failing, leaving the Grand Canyon ecosystem on the brink of collapse.

The Grand Canyon plays a critical role in Arizona's economic and cultural life. But few of our elected leaders have addressed the river's decline, or the consequences this will have on our state.

As the Legislature convenes this week, Arizona citizens should insist that our elected officials speak up for the state's grandest natural treasure.

Scientists first began noticing disturbing changes in the Canyon in the 1970s. The wide diversity of native fish, birds and wildlife began to disappear. River runners arrived at familiar camping spots only to find the formerly lush white-sand beaches turned to narrow strips of mud and the cottonwoods washed away. The Grand Canyon was becoming sterile, and understandably so.

Even small dams disrupt natural river ecological processes, and the Grand Canyon's lifeblood - the Colorado River - is imprisoned between two of North America's largest dams: Glen Canyon and Hoover.

Glen Canyon Dam holds back tons of nutrient-rich sediment that used to feed native fish, form beaches and nourish native plants. The dam also severely drops water temperature in the Grand Canyon Colorado River, eliminates the river's life-giving flooding regimes, and paves the way for the insidious march of damaging non-native species.

In 1992, in response to the alarming degradation of the Grand Canyon ecosystems, Congress passed the Grand Canyon Protection Act and later established the Adaptive Management Program.

The management program was to recommend modifications to Glen Canyon Dam operations to help mitigate adverse impacts caused by the dam to Grand Canyon natural and cultural resources. An advisory committee of representatives from state and federal agencies, Indian tribes, water and power interests, and environmental groups governs the management program.

The impact of this program? Good science is being done, but that's where the good news ends. Three of the five native Grand Canyon fish have disappeared from the Canyon. A fourth species is in serious trouble and now, the only self-sustaining population of endangered Humpback Chub in the Canyon - relatively healthy until this year - is in steep decline.

While fish may be of little interest to the general public, the plight of native fish is the most visible evidence of a complex web of life coming unraveled.

Adaptive Management has been extremely effective, not in restoring the Grand Canyon, but in demonstrating that change is overdue. Among the urgently needed changes are dam operations that mimic natural, seasonal fluctuations in river flows, removal of non-native fish, and restoration of habitats that support native species.

Those changes may mean occasionally producing less power from Glen Canyon dam, reducing the number of trout available for recreational fishing or leaving more water in the river. The commercial power producers, fishing groups and irrigation districts are sure to object.

But many more of us should object to our leaders allowing the Grand Canyon's ecosystems to slowly collapse. This is our Canyon, our culture, our collective identity and if that is too esoteric, our primary draw for tourism and all the attendant economic benefits. What kind of tourism will the "Grand Ditch" attract?

Arizona in 2002 is still a state of great natural beauty, with the Grand Canyon at center stage. Although the state faces a challenging year, we can't let our elected officials ignore the dying elephant in the middle of the room.

Volume 2, Number 1 (Special Issue: Grand Canyon in Crisis)

On January 17-18, 2002 Phoenix will host a meeting of the Glen Canyon Dam Adaptive Management Group--the stakeholder group responsible for managing the impacts of Glen Canyon Dam on Grand Canyon National Park. This group is clearly failing, as native species in Grand Canyon are worse off since the program began in 1996.

Taking Action for the Grand Canyon

[LRC V2, N1, January 2002](#)

I want to hear from you about the declining health of the Grand Canyon ecosystem.

Should I:

- prepare a supplemental EIS for Glen Canyon Dam
- operate the dam to mimic natural river flows and temperatures
- support removal of non-native fish that prey on native species
- make endangered fish recovery a top priority for managers, and
- make hydropower production subservient to ecosystem management?

Silt Happens: LR Forcing Agencies to Respond

[LRC V2, N1, January 2002](#)

The National Park Service is currently preparing a Development Concept Plan for Hite Marina on Lake Powell reservoir, despite the fact that sediment is about to fill the marina's bay.

LIVING RIVERS is leading a coalition of environmental, river recreation and outfitter interests demanding that NPS immediately prepare a sediment management plan and associated environmental impact statement for the entire reservoir.

There's no doubt this reservoir is filling with sediment, said Annie Payne, president of Colorado Plateau River Guides. It's amazing that the government wants to pretend that it's not happening. Payne and other commercial river runners must deal with an

increasing amount of sediment each year, as thousands of multi-day river trips on the San Juan River and Colorado River terminate at Lake Powell reservoir. Most people think of this artificial lake as deep and clear, but for us river guides, it means travelling through miles of exposed sediment, mud, exotic weeds, and dust. This makes for a very unpleasant and sometimes dangerous experience for our customers.

The sediment problem is already affecting Hite Marina, as it will the entire reservoir and dam eventually. In the coalition's nine-page submission to the National Park Service, LIVING RIVERS demanded that no more public funds be expended for infrastructure planning until, one, the public knows how long it will be before sediment renders existing and planned infrastructure useless, and two, immediate work is undertaken to improve access in the river corridors' prior to spending more money on temporary marina facilities.

A brief sediment study for the area surrounding the marina in question, revealed the reservoir's sediment delta will advance up to and beyond the marina in 2003. This will immediately render the marina useless in low water years, with access continuing to decline over time as the delta continues to expand.

Estimates for how long it will take sediment flows to reach the intake infrastructure for Glen Canyon Dam forcing the dam's decommissioning range from 50 to 150 years. But as noted in the submission, geologists point out that any number of factors could cause the large amounts of sediment building-up in the upper part of the watershed to mobilize and rapidly flow into Lake Powell, thus greatly accelerating the rate of siltation and hastening the arrival of the day when Lake Powell reservoir must be drained.

Living Rivers Currents 01/17/02

Native Fish: Recovery or Rhetoric?

[LRC V2, N1, January 2002](#)

The freshwater fishes of the Colorado River watershed are among the most imperiled animals in the United States. In response to mandates of the Endangered Species Act, three endangered fish recovery programs have been implemented in the Colorado basin since 1988. Despite more than \$100 million invested so far, these programs have generated few results. So this fall, the US Fish & Wildlife Service (USFWS) released a draft set of recovery goals which, if approved, would lower the federal standard by which these fish could be removed from the endangered species list.

LIVING RIVERS and several other groups were outraged, and submitted comments opposing the adoption of these weaker, and ecologically dangerous standards. The USFWS proposed to emphasize the use of hatchery fish to be dumped in depleted habitats. Success will be proclaimed by merely continuously restocking the area with a

given number of hatchery fish to maintain an arbitrary population count. Emphasis will not be placed on habitat restoration to allow for self-reproducing populations.

“Species cannot be perpetuated without appropriate habitats, and an aquatic habitat cannot persist without some ecosystem order in its surroundings,” said Dr. Joseph Shannon, an aquatic ecologist at Northern Arizona University. “The water and power interests control the flow of the Colorado River; ecosystem restoration and native fish recovery are not their priorities. I question if this is the sentiment of the majority of the public.”

The state of Colorado is leading the charge to advance the weaker standards. Kent Holsinger, Assistant Director for Colorado’s Division of Water Resources has stated that Colorado is committed to maximizing power generation to finance irrigation, and to diverting more water for development and industrial use. He has declared his state’s intent to fight any federal regulations that may infringe on these objectives.

The prestigious Desert Fishes Council is also concerned, especially over the limited scientific input sought in the preparation of these new guidelines. This international society of academic, government and private organizations, adopted a resolution in November 2001, asking that the USFWS redraft the recovery goals based upon the results of a rigorous, independent, scientific review process.

But if Holsinger and others have their way, it may not be long before visitors to the Grand Canyon will see truckloads of hatchery-raised fish emptied into the Colorado river because agencies were unwilling to work to restore their habitat. Should this trend continue, the same approach could become commonplace with other endangered species—birds, mammals, reptiles—born in captivity and placed in unsuitable habitats to meet the objectives of the government’s bean counters.

Living Rivers Currents 01/17/02

Grand Canyon: LR Calls for Immediate Action

[LRC V2, N1, January 2002](#)

Ecologists have known for years that the operation of Glen Canyon Dam is causing negative impacts on the Colorado River ecosystem in Grand Canyon National Park. The Grand Canyon Protection Act was passed a decade ago to force action to reduce environmental damage downstream of the dam. Yet scientific data show the situation is worsening.

LIVING RIVERS and other groups are calling for an immediate overhaul of the dam management program set up by the Act. The program was established in 1996 following completion of an environmental impact statement on dam operations. A stakeholders group known as the Adaptive Management Work Group (AMWG) guides scientific research and management activities. According to Randy Peterson, Director of Adaptive

Management Programs for the Bureau of Reclamation (BuRec), the AMWG has operated since 1997 with an annual budget of roughly \$8 million. But many wonder if the AMWG is capable of making the necessary changes required to protect and restore the native ecosystem.

The science shows that the program is failing, said David Haskell, retired Science Director of Grand Canyon National Park, and former AMWG representative for the Park Service. The program has been extremely successful and effective, not in complying with the Grand Canyon Protection Act, but in demonstrating that as long as the dam continues to be operated for water and power needs, the ecosystem will continue to be degraded. Five years and forty million dollars have bought us the knowledge that nothing's improving.

In a letter delivered to the AMWG at its January meeting, LIVING RIVERS was joined by a number of groups in demanding action. Among the key concerns is the structure of the process that has accorded hydropower production equal importance to restoration of native habitat.

Protecting native fish and other species is a higher priority than generating cheap hydropower, said David Sherman, a Sierra Club representative in Flagstaff. Changes are needed now to get the adaptive management program on track and in compliance with the law.

LIVING RIVERS is seeking a supplemental environmental impact statement on dam operations to address the rapid decline of the river's ecosystem. The Grand Canyon Protection Act and other laws require agencies to protect the park's riverine environment, but the responsible federal agencies have failed to make progress toward this goal. Management has not benefited the endangered humpback chub. Non-native trout, on the other hand, thrive despite scientists warnings that trout prey on native fish and compete for a limited food supply.

Science shows that changes are needed, but those changes have not been implemented, said Dr. Robert Witzeman, of Maricopa Audubon Society in Phoenix. There is resistance to doing what needs to be done.

LIVING RIVERS is also calling on the AMWG to recommend changes in dam operations to mimic natural, seasonal fluctuations in river flows, remove non-native fish, and reintroduce and recover endangered native fish. Scientists now openly wonder whether it is possible to adequately mitigate the impacts of Glen Canyon Dam. Decommissioning may prove to be the only option. Time is running out for the Grand Canyon, and hard choices must be made. LIVING RIVERS will continue to press for doing what's right for the river.

Electroshock in the Grand Canyon

[LRC V2, N1, January 2002](#)

Along with every watt of power extracted from the Colorado River at Glen Canyon Dam goes another piece of Grand Canyon's natural heritage. The hourly, daily and seasonal regulation of flows at the dam to accommodate variations in energy demand is one of the major variables causing habitat degradation in the nation's premier national park. Although scientists have been pushing for releases that mimic more the river's natural flow condition, those representing electrical utilities remain unconvinced. According to some, power interests are using their influence to impede efforts to reverse the decline of the Grand Canyon ecosystem.

From the beginning, power users have had to be dragged into this kicking and screaming, said Dave Wegner, who headed up Glen Canyon Environmental Studies, forerunner of the Grand Canyon Monitoring and Research Center. We lost two years alone navigating the hoops and hurdles they put in our way just to run our first test back in 1996.

Others working with the Adaptive Management Program now concur, citing a general pattern of objections to most proposals, dragging out decisions and delaying action whenever possible.

Meanwhile, the situation in the Canyon worsens, stated Nikolai Ramsey of the Grand Canyon Trust. The latest studies show that humpback chub, an endangered fish, are in substantial decline.

It's categorically untrue that power interests are obfuscating or impeding this process, said Clayton Palmer, with the Western Area Power Administration, the federal agency responsible for marketing power from Glen Canyon Dam. Palmer cited several examples where other agencies were unwilling to support proposals advanced by power interests. One, advocating large releases which might aid with preserving sediment in the Canyon, was opposed by the US Fish and Wildlife Service concerned about impacts on an endangered invertebrate, the Kanab ambersnail.

Palmer and other power proponents are quick to point out that they are indeed full partners, as nearly all the money used for Glen Canyon Dam Adaptive Management comes from hydropower revenues. It's ludicrous that other government agencies and private foundations aren't helping us out, said Leslie James of Colorado River Energy Distributors Association. Such mitigation funds are, however, routinely tied to hydropower revenues.

James also argues that there is not yet enough science to determine if dam operations are the major problem. But a new report out for review this month by Grand Canyon Monitoring and Research Center indicated that dam operations are affecting not only

native fish, but also the food web of the entire Canyon. Native biodiversity of the Grand Canyon's river ecosystem is on a downward spiral, largely the result of Glen Canyon Dam. The report recommends that dam operations mimic seasonal flows, not fluctuating flows. Utilities are concerned because this would cause a price increase for power from Glen Canyon Dam of about 21 percent, to about \$21 per megawatt. This is still a bargain, costing only about half the price these utilities would pay should they choose to obtain power from other sources.

Living Rivers Currents 01/17/02

Colorado River Water Users Meeting: Environment Gains Recognition

[LRC V2, N1, January 2002](#)

Just a few short years ago the ecological and social values of the Colorado River delta were barely acknowledged. At this year's Colorado River Water Users Association (CRWUA) annual conference, nearly every speaker addressed the environmental issues of the delta, even though no advocacy group was invited to speak on its behalf. But we were there nonetheless. In the halls, business meetings and press briefing, LIVING RIVERS took every opportunity to advance the cause of the delta and other critical environmental and social issues not being addressed by agencies using and managing the Colorado River.

Gilbert Sanchez of Tribal Environmental Watch Alliance told journalists during the LIVING RIVERS press briefing that the cultural heritage of Indian people is threatened by water development projects. All this damage, and for what? Much of this water is stored just to evaporate into the sky. Ancestral gravesites should not be sacrificed for more golf courses, backyard swimming pools and hayfields in the desert.

Yamilett Carrillo-Guerrero, of ProNatura Sonora, a Mexican environmental protection group, echoed these concerns. Local communities in the delta are ready to contribute with land and water to help restore the delta. For them, a river with water means life. In no way do they consider water nurturing the Colorado River delta wetlands and the Upper Gulf of California as wasted, said Ms. Carrillo-Guerrero.

LIVING RIVERS presented a letter to CRWUA's board on behalf of the binational coalition working for delta restoration, seeking a partnership with the association in working to move more water to the Colorado River delta. Although some members expressed opposition, the board did invite a formal presentation on the proposal for its spring meeting. Pat Mulroy, Director of the Southern Nevada Water Authority, noted that water agencies indeed need to start paying attention. Environmental responsibility is the job of every water manager, she said. Those who are demanding to have their voices heard are not our traditional customers.

LR Letter 01/18/02

To department of Interior demanding action on restoration of Grand Canyon

Mr. Michael Gabaldon
Deputy Director of Operations
U.S. Bureau of Reclamation
Department of Interior
1849 'C' Street, NW
Washington, DC 20240
January 18, 2002

RE: Comments on Adaptive Management Working Group and proposed Strategic Plan

Dear Mr. Gabaldon,

The eight undersigned non-governmental organizations, including LIVING RIVERS, Center for Biological Diversity, Colorado Plateau River Guides, Flagstaff Activist Network, Forest Conservation Council, Glen Canyon Institute, John Muir Project (Earth Island Institute), Maricopa Audubon Society, and Sierra Club write to submit comments on the proposed Strategic Plan of the Adaptive Management Work Group (AMWG).

We recognize the large amount work that has been done on this plan, and we commend the scientists and others who have labored to produce that document. In the short period of its existence, the Program has made a significant contribution to expanding the scientific knowledge and understanding of the Grand Canyon ecosystem. However, despite its accomplishments the Program can and must be more effective. It is failing in its primary goal of protecting and mitigating the adverse impacts of Glen Canyon Dam on the river ecosystem of Grand Canyon National Park.

Our comments address a number of shortcomings of the Program and its Strategic Plan document as well as makes recommendations for addressing these shortcomings.

I. SUMMARY OF ADAPTIVE MANAGEMENT PROGRAM CONCERNS

A. The Program has failed to establish a new population of the endangered humpback chub, as required by the Record of Decision. This should be a top priority.

B. The Program has not made measurable progress toward recovery of endangered species, including the humpback chub and razorback sucker, or towards reintroducing extirpated species, including the endangered Colorado pikeminnow and bonytail chub.

C. The Program has failed to provide suitable aquatic habitat conditions and water temperatures necessary for native fish reproduction and survival in accordance with the biological opinion on endangered fish.

D. The Program has not attempted to remove non-native fish including trout and catfish that are known to prey on or compete with humpback chub.

E. The Program has not undertaken necessary management activities, including dam operation changes, to significantly increase sediment deposition (including silts, sands, clays and detritus) into the riverine ecosystem which would increase the number and extent of beaches, backwaters, eddies and sand bars throughout the canyon ecosystem, provide wildlife and fish habitat and benefit recreational users, and protect from erosion damage irreplaceable archeological resources and cultural and sacred sites;

F. The Program has failed to demonstrate compliance with the directive in the Record of Decision, to "find an alternative dam operating plan that would permit recovery and long-term sustainability of downstream resources while limiting hydropower capability and flexibility only to the extent necessary to achieve recovery and long-term sustainability."

G. The Program has failed to encourage public involvement and participation in Program work.

H. The Program has not prioritized goals and management activities, to emphasize protecting and mitigating the adverse impacts to park resources from Glen Canyon Dam, over hydropower generation and trout production.

I. The Program has failed to publish and distribute an annual report on the review of monitoring data required by the Program's Charter, together with recommendations for management actions and modifications to the Record of Decision. Neither has the Program provided input to the Secretary for her required annual report to Congress and the States, pursuant to the Grand Canyon Protection Act, Section 1804(c)(2).

J. The Program has failed to consult regularly with the US Fish & Wildlife Service on progress toward meeting reasonable and prudent alternatives, as required in the December 1994 biological opinion on endangered fish.

K. The Program has failed to implement seasonally adjusted steady flows from Glen Canyon Dam as required by the December 1994 biological opinion on endangered fish.

These concerns will be addressed in more detail below.

II. CONSULTATIVE GROUPS, ADAPTIVE MANAGEMENT, AND THE SCIENTIFIC PROCESS

The shortcomings identified above result in part from the structure and function of the Adaptive Management Program. Despite the focus on science as a guiding principle for informing the process, decisions are made mostly by governmental officials and representatives of political and economic interest groups appointed to the Adaptive Management Work Group (AMWG). Science plays only an advisory role in the process.

The Grand Canyon Protection Act, Section 1805 requires consultation with various stakeholder interests on long-term monitoring programs and activities. Creation of the AMWG is authorized by the Record of Decision, Section VI(1), Environmental Commitments and Monitoring, in accordance with the Federal Advisory Committees Act

(FACA). Specific direction for Program management and operations is found in the updated AMWG Charter, dated January 10, 2001, and the AMWG Operating Procedures, dated June 18, 1998.

The AMWG delegates authority to the Technical Work Group (TWG) to supervise the scientific and management work of the Grand Canyon Monitoring & Research Center (GCMRC), a federally funded agency affiliated with Reclamation and the US Geological Survey. The TWG makes recommendations to the AMWG about scientific priorities, protocols, and research needs. The AMWG takes those recommendations into consideration when making Program recommendations to the Secretary.

The Program is structured so that a diverse group of stakeholder interests (AMWG) makes recommendations to the Secretary on a consensus basis (or nearly so), on a wide range of complex scientific and technical issues that are often highly contentious. Economic interests within this framework have significant influence over the decision making process, including the scientific monitoring and research agenda.

Program scientific work is of high caliber and is making an important contribution to the body of knowledge of river ecosystem function in Grand Canyon National Park. However, managers are ignoring much of this science. Program decisions, dominated by water and power interests, often limit scientific effectiveness. Restoration objectives are subservient to water and power objectives. Hydropower revenues fund the vast majority of Program activities, and it is not surprising that hydropower interests have blocked some efforts to run experimental high flows that bypass the dam's turbines. Water users insist that all experimental flow regimes be consistent with, and subordinate to Law of the River delivery criteria, even when this limits the effectiveness of the scientific research agenda.

The Program has been extremely successful and effective in demonstrating that as long as the dam is operated for water and power needs, the ecosystem continues to be degraded. The science may conclusively confirm that the dam's impacts cannot be adequately mitigated or overcome, yet there exists no provision in the Program for addressing such an eventuality.

III. DAM OPERATING CONSTRAINTS LIMIT SCIENTIFIC FLEXIBILITY AND OPPORTUNITIES

Glen Canyon Dam is currently managed under operating constraints that limit flexibility for scientific inquiry and experimentation. Dam operations--including meeting water delivery criteria and hydropower generation demands--are sometimes in direct conflict with scientific experimentation objectives. Constraints on dam operations can infringe upon experimental flow regimes that may offer significant benefits. The Record of Decision mandates that high experimental flows that bypass the dam's turbine generators may only occur in conjunction with "dam safety" releases--i.e. high-water events that require the reservoir to be drawn down quickly. The pre-dam Colorado River in Grand Canyon reached its peak flow in late spring and early summer, and scientists argued for conducting high flows tests to coincide with the natural high flow season. However, "dam safety release" conditions tend to occur in early spring. It is therefore

not possible under existing operating criteria to fully mimic the river's natural hydrograph, which may be necessary to ensure recovery.

To realize the full benefits of adaptive management for dam-controlled river ecosystems, scientists need freedom to design and conduct a range of experimental flows and other management actions. Legal constraints, including mandated water delivery schedules under the Law of the River, are probably not possible to change. However, hydropower generation needs do not have the same level of legal protection that water delivery does. Program managers should consider potential changes to dam operating criteria that would permit greater flexibility for scientists, even if hydropower production may be reduced.

IV. COMMENTS ON STRATEGIC PLAN

The Strategic Plan proposed for adoption contains a "Vision and Mission" statement, a set of nine Principles, a list of twelve Goals, a matrix of Management Objectives tiered to each of the Goals, and a detailed set of Research and Information Needs identified to address the Management Objectives. We appreciate the extensive effort that has gone into producing this complex document, and we applaud the high caliber of scientific work and analysis that underlies this plan. However, here are several areas where the plan is deficient and in need of changes or refinement.

A. Vision and Mission.

The statement notes the Program's obligation to follow applicable laws and mentions the "Law of the River" by name, but lacks an explicit reference to the Grand Canyon Protection Act. Since the Program owes its existence to the Act, it is appropriate to note that. The statement also refers to protecting, mitigating, and improving the "Colorado River ecosystem affected by Glen Canyon Dam." This is useful language, but should be strengthened by adding specific reference to Grand Canyon National Park.

The Secretary has a substantial legal mandate, embodied in numerous laws, that requires protection of the natural ecosystem of Grand Canyon National Park. This body of law has been made subservient to the body of law that supports the interests of water and power users. When conflicts occur, the weight is usually in favor of water and power. The Program vision and mission statement must recognize that the two bodies of law have equal force, and note that these are in substantial, direct conflict.

B. Principles and Goals.

Funding Concerns: Principle One states, "Some of the objectives and actions that fall under these goals may not be the responsibility of the ... Program, and may be funded by other sources, but are included here for completeness." Given the growing and urgent problems affecting the Grand Canyon, it is critical to indicate in the Plan, which objectives and actions are not considered to be the responsibility of the Program. There is an expressed need for additional funding for scientific monitoring and research. The Secretary and the public need to know which activities are funded, and through what sources, and those activities where other sources must be secured.

C. Managing for Endangered and Native Species.

Principle Two states, "The construction of Glen Canyon Dam and the introduction of non-native species have irreversibly changed the Colorado River ecosystem." While some ecosystem changes may be irreversible, others are susceptible to change. This statement should be modified to read "... non-native species have led to many changes to the Colorado River ecosystem, some of which may be irreversible."

Principle Three states, "Much remains unknown about the Colorado River ecosystem below Glen Canyon Dam and how to achieve the Adaptive Management Program goals." There is much about the ecosystem that is known, and this statement could be interpreted so as to mean that too little is known for management actions to be taken at this time. The Principle should be reworded to avoid giving the Secretary a misleading impression. Suggested change: "Much remains unknown about the Colorado River ecosystem below Glen Canyon Dam but enough is known to guide the implementation of the Adaptive Management Program goals."

Principle Four states, "Management efforts will prevent any further human-induced extirpation or extinction of native species." This statement should be strengthened to make the Principle consistent with the National Park Organic Act and the recovery standard of the Endangered Species Act. Suggested addition: "...and will strive to recover endangered species and reintroduce extirpated species."

Goal One states, "Protect or improve the aquatic foodbase so that it will support viable populations of desired species at higher trophic levels." Non-native species generally constitute a threat to native species' survival. This Goal should be clarified to emphasize viable populations of desired native species.

Goal Two states, "Maintain or attain viable populations of existing native fish, remove jeopardy from humpback chub and razorback sucker, and prevent adverse modification to their critical habitat." Federal agencies are required to contribute to endangered species recovery. This Goal should be amended to read: "Maintain or attain viable populations of existing native fish, remove jeopardy from humpback chub and razorback sucker and contribute to their recovery, and prevent adverse modification to their critical habitat."

Goal Three states, "Restore populations of extirpated species, as feasible and advisable." This Goal may be inconsistent with National Park Service regulations that require the agency to reintroduce all native species, wherever it is ecologically feasible to do so. Use of the term "advisable" in the context of this Goal implies that the National Park Service has discretion to reintroduce species on the basis of "advice," but such is not the case. Also, use of the term "feasible," without qualification, may be interpreted as economic feasibility, implying that extirpated species may be restored only if funding is readily available. Finally, as noted above, agencies are required to contribute to recovery of listed species. The Goal should be amended to read, "Restore populations of extirpated native species, wherever ecologically feasible, and contribute to their recovery."

D. Rainbow Trout Management

Goal Four states, "Maintain a naturally reproducing population of rainbow trout above the Paria River, to the extent practicable and consistent with the maintenance of viable populations of native fish." This Goal is not supported by law, and is known to be in direct conflict with native fish recovery efforts. Trout are known predators of endangered humpback chub and other fish, and the cold water temperatures needed to support trout are known to hamper humpback chub reproduction. Maintaining a reproducing population of rainbow trout requires maintaining a year-round, cold-water regime. Low water temperature in summer is one of the primary known contributing factors of native fish endangerment. This Goal should be deleted because it is in direct conflict with achieving the goal of the Grand Canyon Protection Act and the Endangered Species Act.

E. Kanab Ambersnail

Goal Five states, "Maintain or attain viable populations of Kanab ambersnail." The Vasey's Paradise population of Kanab ambersnail, by virtue of its primary habitat location below the pre-dam high water line, is considered to be at risk in the event of future high experimental flows. To emphasize the need for protecting this population, this Goal should be qualified by adding a phrase such as, "...including one or more populations located above the old (pre-dam) high water line."

F. Experimental Approaches

Principle Six states, "Dam operations and management actions will be tried that attempt to return ecosystem patterns and processes to their range of natural variability. When this is not appropriate, experiments will be conducted to test other approaches." The Principle does not explain what circumstances might make restoration of natural processes inappropriate, nor does it suggest what other approaches would be appropriate that accomplish something other than restoring ecosystem patterns and processes. The first sentence of the Principle stands on its own, and the second sentence should be deleted.

G. Prioritizing Competing Management Actions

Principle Seven reflects the intent to maximize benefits across the board wherever possible, while minimizing negative impacts on individual goals where conflicts arise. This approach assumes that all Program goals are (more or less) equally worthy. However, the goals that promote non-native fish reproduction and seek to increase hydropower generation should be considered of lower priority than those that improve native habitat and contribute to species recovery. The Principle should be rewritten to clarify this distinction.

H. Hydropower Generation

Goal Ten states, "Maintain power production capacity and energy generation, and increase where feasible and advisable, within the framework of the Adaptive Management ecosystem goals." As noted above, power generation is a lower priority

relative to Program priorities and is often in conflict or potential conflict with ecosystem restoration objectives. The intended meaning of the phrase "increase where feasible and advisable" is unclear. This Goal should be modified with language like the following: "Allow for power production capacity and energy generation, where not in conflict within the framework of the Adaptive Management ecosystem restoration goals."

V. RECOMMENDED PROGRAM CHANGES AND IMPROVEMENTS

A. Annual Report. According to the AMWG Operating Procedures, Item #11, "Records and Record Keeping."

AMWG is required to prepare an annual report pursuant to the Grand Canyon Protection Act, Section 1804(c)(2). This report should include the State of the Natural and Cultural Resources in the Colorado River Ecosystem, as well as recommendations to the Secretary on future dam operations.

B. Establish a New Population of Humpback Chub.

The Record of Decision, Section VI(5), states, "New Population of Humpback Chub: In consultation with the U.S. Fish and Wildlife Service (FWS), National Park Service, and Arizona Game and Fish Department (AGFD), [Bureau of] Reclamation will make every effort (through funding, facilitating, and technical support) to ensure that a new population of humpback chub is established in the mainstem or one or more of the tributaries within Grand Canyon." This language makes clear that the Secretary intended that every effort should be made to establish a new population of chub, yet there is no evidence that the agency has undertaken this task. This is a major concern that must be addressed immediately by Reclamation and by the Program.

C. New Information on Chub Requires a Supplemental EIS.

Preliminary data recently released by the Grand Canyon Monitoring & Research Center (GCMRC) indicate a precipitous decline in the number of adult humpback chub of reproducing age. This decline, while not surprising given lack of management activities on behalf of the chub, was not anticipated when the Record of Decision was signed. The population has been considered to be fairly stable over the last decade or more. Therefore, under National Environmental Policy Act (NEPA) regulations found at 40 CFR 1502.9(c)(1)(ii), these new data represent "significant new circumstances or information relevant to environmental concerns," triggering a requirement to prepare a Supplemental EIS (SEIS) to the 1996 Glen Canyon Dam EIS. The Bureau of Reclamation, the National Park Service, and other agencies may be in violation of the Endangered Species Act and the Grand Canyon Protection Act for failing to ensure protection and recovery of the humpback chub population in Grand Canyon National Park.

D. Trout and Non-Native Fish Management

Eliminate from the Plan the Goal and Management Objectives for encouraging trout production, and pursue an aggressive effort to reduce the population of brown trout,

rainbow trout, and the various species of catfish, carp and other non-native fish that prey on or compete with the native fish species.

E. Recover and Reintroduce Endangered Species

Make measurable progress toward endangered species recovery. Reintroduce razorback sucker, Colorado pikeminnow, bonytail chub, and other extirpated native species. In accordance with the biological opinion on endangered fish, prevent adverse modification of critical habitat, and provide suitable aquatic habitat conditions and water temperatures necessary for native fish reproduction and survival. Assess and report on the status of flannel-mouth suckers and other native species that are not yet listed but which may require special management assistance to prevent listing in the future.

F. Establish an Independent Review Panel to Study the Program and Make Recommendations

The Record of Decision provides for independent scientific review panels to monitor and provide oversight of Program research activities. An independent review panel should be convened to analyze and evaluate the effectiveness of the Program as a whole, and make annual recommendations on ways of making the Program more effective, including changing the structure of the Program.

G. Establish a Public Communications and Outreach Program

The Program should undertake an outreach effort to inform the public and encourage public participation in the adaptive management process. Information about the Program is not readily accessible to a lay audience, and few people are well informed of the important yet complex issues. Holding public meetings in different cities would help to raise the profile of the issues. Making creative use of the Program's Internet site as an access point for information could be a particularly helpful strategy. Combining efforts with the Grand Canyon Monitoring & Research Center, Grand Canyon National Park, and other entities could result in dramatically increasing public understanding of the issues before the Program.

H. Seek Additional Program Funding Sources

The Program must have sufficient funding to conduct science activities and take authorized management actions. Additional funding from hydropower revenues, as well as appropriated funds and grants from non-governmental sources should be sought to ensure that all necessary scientific and management activities are conducted in a timely fashion.

I. Increase the Role and Visibility of the National Park Service

The U.S. Bureau of Reclamation is designated as the lead agency for logistical coordination of Program work. However the focus of the Program is protecting and restoring the riverine ecosystem of Grand Canyon National Park. As the agency charged with protecting the park, the National Park Service should play a prominent role

in public outreach as well as in the Program's decision making process and scientific research efforts.

J. Comply with the USFWS Reasonable & Prudent Alternative

The USFWS December 1994 biological opinion, under "Elements of the Reasonable and Prudent Alternative [RPA]," page 34 states, "Those elements [of the RPA] that can be accomplished without further verification of NEPA compliance should be implemented without delay... Reclamation and the Service will meet at least annually to coordinate reasonable and prudent alternative activities."

The document goes on to prescribe, on page 35, "high steady flows in the spring and low steady flows in summer and fall during low water years (releases of approximately 8.23 maf) to verify an effective flow regime" and specifies that the "research design and hypotheses to be tested will be based on a flow pattern that resembles the natural hydrograph, as described for those seasons in the SASF [seasonally adjusted steady flow regime]." The RPA requires these flows to be implemented by 1998 at latest, and provides for re-initiation of consultation with Reclamation in the event that study design does not provide information necessary to support removal of jeopardy to the endangered fish. Reclamation must demonstrate that it is making every effort to comply with RPA requirements and remove jeopardy, including managing Glen Canyon Dam releases in accord with the SASF regime and experimenting with beach habitat building flows in spring in conformance with RPA specifications. Should it be necessary, Reclamation should reinitiate consultation with USFWS at the earliest opportunity.

K. Tribal relationships

The Program should make every effort to include the Indian tribes in the decision making process and ensure that their concerns and their funding needs are addressed . In particular, the protection of archeological and cultural resources, as well as sacred sites in the Grand Canyon should be a high priority. The Program should consider the tribes as sovereign nations and coordinate administrative and programmatic work with them in recognition of their sovereign status.

VI. CONCLUSION

The importance of the Adaptive Management Program to ensuring the future health and vitality of the globally significant Grand Canyon ecosystem cannot be overstated. Much good work has been done to illuminate the opportunities for addressing threats to ecosystem function, and this work must continue. However, growing evidence indicates an ongoing decline in many key indicators. At the same time, there exist numerous inefficiencies and impediments to solving the difficult problems caused by Glen Canyon Dam, and these threaten the integrity of the Program over the long term.

Our organizations seek a cooperative and constructive approach that maximizes the effectiveness of management actions and makes full use of the scientific data being collected. We look to the agencies and other entities involved in the Program to provide

leadership and expertise to make progress, before more species go extinct or are added to the endangered list.

We seek evidence of forward momentum, in particular, from the agencies with statutory responsibility to protect the Grand Canyon ecosystem. As noted above, the new population data on humpback chub appears to require a Supplemental EIS for dam operations. This would provide an opportunity to address a range of scientific and management issues that have been informed by five years of Program monitoring and research activities. We look forward to working with you on these issues. Please let us know how we can be of assistance. We look forward to hearing from you at your earliest convenience.

Sincerely,

Groups Call for Action to Save Colorado River in Grand Canyon National Park

CONTACT:

John Weisheit or David Orr 435-260-2590

Lisa Force 480-990-7839

PHOENIX, Jan. 18 -- The environmental and social justice organization LIVING RIVERS led a rally in downtown Phoenix today to demand immediate action to save the ecosystem in Grand Canyon, the nation's premier national park.

LIVING RIVERS was joined by the Center for Biological Diversity, Sierra Club, Audubon Society and other groups in calling on the Department of the Interior to start following the laws that require mitigation of the Glen Canyon Dam's adverse impacts to the Colorado River ecosystem--the heart of the Grand Canyon National Park.

"Several native fish species have already been lost, and one more numbers in only the thousands," David Orr of LIVING RIVERS told the crowd of about 60. "Add to this the changes in the food web that form the foundation for the Canyon's ecology and the picture is clear, the Grand Canyon is becoming the Grand Ditch."

Interior officials and other stakeholders interested in Glen Canyon Dam and the Grand Canyon wrapped-up a two-day meeting today at the site of the rally. They were attempting to salvage a five-year old federal program that was supposed to reverse the dam's negative impact on Grand Canyon.

"The environment of Grand Canyon is being sacrificed," said Michelle Harrington of the Center for Biological Diversity. "Americans are outraged to learn that, despite five years and forty million dollars this program has made so little progress."

In advance of the rally the groups formally presented their demands in a [ten-page letter](#) to Mr. Michael Gabaldon, deputy Interior Secretary and chair of the government program known as Glen Canyon Dam Adaptive Management. The groups seek

remedies where the program stands in violation of laws governing the Grand Canyon ecosystem, including the Grand Canyon Protection Act and National Park Organic Act. Specifically, the program fails to:

- * develop a dam operating plan that would permit recovery and long-term sustainability of downstream resources.
- * provide suitable aquatic habitat conditions and water temperatures necessary for native fish reproduction generally, and the establishment of a new population of the federally endangered humpback chub.
- * address the removal of alien fish, such as trout and catfish that compete with natives.
- * to increase sediment deposition for habitat mitigation and river recreation.
- * to produce mandated annual reports or to properly consult with the public and key federal agencies including the US Fish & Wildlife Service.

"It's a travesty that those involved in this program have been so negligent in fulfilling their mandate to reverse the habitat decline of this international treasure," added Mr. Orr. "Although we hope they will quickly address our concerns, we trust litigation may ultimately be required to force this body into action."

The groups are demanding that a new environmental impact statement on Glen Canyon Dam operations be undertaken in light of new science data that demonstrate declines in key ecological indicators, including native fish, invertebrates, and sediment.

Take Action 01/20/02

Save Grand Canyon from Glen Canyon Dam

Join LIVING RIVERS, Maricopa Audubon Society, the Sierra Club, Glen Canyon Institute, Forest Conservation Council, and others to send a message to the Department of Interior to stop killing the Grand Canyon. Several native fish species have already been lost, and one more numbers only in the thousands. Add to this the changes in the food web that forms the foundation for the Canyon's ecology and the picture is clear, the Grand Canyon is becoming the Grand Ditch.

The federal program established five years ago to mitigate these problems, caused by the operation of Glen Canyon Dam, is clearly failing. On January 18, 2002 these groups presented a letter to the Glen Canyon Adaptive Management Program outlining the program's flaws, violations of law and remedies that must be pursued to reverse the decline of the Colorado River ecosystem through Grand Canyon National Park. The major concerns include:

- Failing to develop a dam operating plan that would permit recovery and long-term sustainability of the Grand Canyon's riverine resources.
- Failing to establish suitable aquatic habitat conditions and water temperatures necessary for native fish reproduction generally, and the establishment of a new population of the federally endangered humpback chub.
- Failing to address the removal of alien fish, such as trout and catfish that compete with natives.
- Failing to increase sediment deposition for habitat restoration and river recreation.
- Failing to produce mandated annual reports or to properly consult with the public and key federal agencies including the US Fish & Wildlife Service.

But hearing from us is not enough. Let Gale Norton hear from you!.

It's critical that the public let her know that the time for action is NOW!

"I want to hear from you about the declining health of the Grand Canyon ecosystem."

Should I:

- Prepare a supplemental EIS for Glen Canyon Dam?
- Operate the dam to mimic natural river flows and temperatures?
- Support removal of non-native fish that prey on native species?
- Make endangered fish recovery a top priority for managers, and
- Make hydropower production subservient to ecosystem management?

Groups voice concern about censor of public comments on Grand Canyon Restoration.

Mr. Michael Gabaldon, W-6000
Director of Policy, Management, and Technical Services
Bureau of Reclamation
Main Interior Building
Room 760-MIB
1849 C Street, NW
Washington, D.C. 20240-0001
Dear Mr. Gabaldon;

At the Adaptive Management Work Group meeting on 18 January 2002, a presentation was made by Mr. David Orr regarding [concerns that Living Rivers and other organizations have about the AMWG and its strategic plan.](#)

Following Mr. Orr's presentation, Rick Johnson moved to have the letter outlining these concerns remanded to the Strategic Plan ad hoc committee to review and make recommendations as appropriate. This motion resulted in considerable heated discussion and was ultimately rejected. This letter is to convey the views of the minority group to you, members of the AMWG, and the Secretary of Interior.

We feel strongly that the AMWG, which makes recommendations to the Secretary of Interior about the management of public resources, not only would benefit from public input, but also has a responsibility to consider comments from the public. Although the AMWG represents diverse interests, it clearly does not represent all interests. To meet the program's vision of providing a "stewardship worthy of the Grand Canyon," the AMWG must be open to considering how to improve the process and the management of these resources.

The responsibility to consider comments from the public is derived from the AMWG Operating Procedures and the Grand Canyon Protection Act. The Operating Procedures state that the AMWG was formed to comply with the consultation requirement of the Grand Canyon Protection Act. The consultation section of the Act states that monitoring and other activities shall be established and implemented in consultation with the general public. It seems clear that Congress did not intend for the AMWG to make recommendations in isolation from the general public.

In addition to our concerns about the AMWG rejecting an opportunity to consider public comments, we are also disturbed about the speculative and untrue remarks about motives and credibility that were made during the discussion. These remarks were deeply offensive and inappropriate. We request that in the future, the chair take active steps to discourage such remarks and refocus discussion on the motion at hand. We regret that the AMWG refused to review comments from a member of the public and that the discussion was so acrimonious. It is our fervent hope that this does not happen

again, and that the AMWG will develop a mechanism to gracefully consider the views of those who are not appointed stakeholders.

Sincerely,

Rick Johnson
Southwest Rivers

And the other members of the minority group,

Andre Potochnik
Grand Canyon River Guides

Geoffrey Barnard
Grand Canyon Trust

River News 01/29/02

One Step Closer to Taking Down Fossil Creek Dams

After the historic agreement between Arizona Public Service Company (APS) and a contingent of environmental groups to remove two hydroelectric plants on Fossil Creek was reached in November 2000, the Federal Energy Commission (FERC) slammed on the brakes. FERC was simply unsure how to proceed with the unprecedented request of an electric utility, positioned to receive a renewed 50-year license, to surrender their license.

The first complication was that APS refused to apply for license surrender until it had confirmation from FERC that it could continue operate under annual licenses until 2004. To complicate matters, APS requested that FERC issue a Declaratory Order seeking confirmation that FERC would not allow other utilities to compete for future operation of the plants, if for some reason FERC did not accept APS's surrender.

Intervening environmental groups, including Living Rivers, asked that FERC issue an order which would allow us to proceed with the terms of the settlement agreement, including decommissioning of both plants and return of full flows to Fossil Creek by 2004. The agreement also included removal of most plant facilities and restoration the damaged areas by 2009, by APS at APS's cost.

In a huge victory for decommissioning efforts everywhere, FERC issued a Declaratory Order in December 2000 that supports our decommissioning agreement with APS. In response to APS concerns about competition for operating the plants, FERC stated, "We conclude that there is no compelling reason for allowing another round of relicensing competition. We do not believe it would be in the public interest to initiate a new relicensing procedure when the existing licensee has attempted to resolve matters by seeking a settlement, even if that settlement might lead to surrender of the license and removal of project works, including any associated dams."

In response to APS's foot-dragging on applying for license surrender, FERC responded, "Delay of a license surrender, rather than being precluded by our regulations, is actually required by them. There is nothing in the FPA or our regulations prohibiting continued generation beyond the time at which we issue a surrender order."

FERC followed up its Declaratory Order with a letter just last week to APS stating that since FERC has resolved the procedural issues, it now needs to know APS plan and schedule for filing its application to surrender the license to operate the hydro plants. Once the surrender application is filed, the next step will be convince FERC to accept it as written under the terms of the decommissioning agreement. Any substantial changes imposed by FERC would give either party the option to withdraw. Stay tuned to this website for further updates.

Living Rivers Currents 02/01/02

Volume 2, Number 2 (Special Issue: Colorado River Compact)

From January 30 through February 1, the 2002 Colorado River Symposium took place at historic Bishop's Lodge—site of the 1922 negotiations for the Colorado River Compact. While various management challenges for the once-mighty Colorado were on the agenda, this issue of LIVING RIVERS Currents was circulated to promote efforts to bring about fundamental changes in the Compact itself, so that Colorado River laws are up to date with present concerns.

Ten Reasons for Renegotiating the Colorado River Compact

LIVING RIVERS is calling for renegotiating the Colorado River Compact. This would make possible a number of needed changes and innovations, including the following:

1. Indian tribes participating as sovereign nations, protecting and defending their own rights and interests in the river;
 2. Making protection of the environment and the river's ecosystem top priorities in management decisions;
 3. Equitably apportioning among all the basin's stakeholders, including the environment, the actual amount of water in the river—to ensure that even in drought years stakeholders receive a proportional allocation;
 4. Applying the public trust doctrine in apportionment and river management decisions, in recognition that the waters of the Colorado River and its tributaries are to be held in trust for the enjoyment, benefit and welfare of all the basin's inhabitants;
 5. Creating a basin-wide water trust fund to accept and protect from appropriation donations of voluntarily conserved water to benefit the environment;
 6. Establishing and enforcing mandatory water conservation measures, and providing incentives for implementation and penalties for wasteful use;
 7. Harmonizing state water laws basin-wide, and removing legal barriers to ecologically sound river management;
 8. Encouraging appropriate (sustainable) agricultural practices by imposing reasonable restrictions on irrigation technologies and cropping patterns;
 9. Establishing strict limits on interbasin transfers including prohibition of new out-of-basin diversions; and
 10. Providing mechanisms for ongoing dialogue and negotiation among the interested parties to address new information and changing circumstances.

Living Rivers Currents 02/01/02

One Step Closer To Removing Two Dams on Fossil Creek

In a huge victory for decommissioning efforts everywhere, the Federal Energy Regulatory Commission (FERC) issued a Declaratory Order that supports movement toward the removal of two dams on Fossil Creek in central Arizona. LIVING RIVERS and other groups have been protesting efforts by Arizona Public Service (APS) to renege on an agreement to surrender its operating license for the dams—a critical step toward decommissioning.

APS claimed that, should it surrender its operating license, FERC might then choose to grant the license to a competitor. However, in late December FERC wrote, “We conclude that there is no compelling reason for allowing another round of relicensing competition. We do not believe it would be in the public interest to initiate a new relicensing procedure when the existing licensee has attempted to resolve matters by seeking a settlement, even if that settlement might lead to surrender of the license and removal of project works, including any associated dams.”

FERC followed up its Declaratory Order with a letter to APS in January stating that, since FERC has resolved the procedural issues, FERC now needs to know APS’ plan and schedule for filing its application to surrender the license to operate the hydro plants. Once surrendered, and approved by FERC, decommissioning can commence.

Living Rivers Currents 02/01/02

Grand Canyon: Phoenix Takes Action

Last month, while bureaucrats and scientists convened in Phoenix’s premier downtown office tower to discuss the disintegrating health of the Grand Canyon, activists led by LIVING RIVERS gathered outside to demand results.

The Glen Canyon Dam Adaptive Management Work Group (AMWG) gathered January 17-18, five years and \$40 million dollars into a process that so far has not yet put in place a plan for pulling the Grand Canyon ecosystem back from the brink of collapse, where it teeters today.

Although AMWG is mandated to provide a mechanism for public input, it rejected such input when offered by LIVING RIVERS, Sierra Club and other groups who collectively submitted a ten-page letter demanding immediate action. The organizations pointed out that in spite of Grand Canyon Protection Act requirements, the impacts of Glen Canyon Dam on Grand Canyon are not being adequately addressed.

The dam holds back nutrient-rich river sediments vital to many Grand Canyon native species, keeps water temperature unnaturally cold in the canyon and eliminates the

river's life-giving flooding regimes. The result: a Grand Canyon that is slowly becoming sterilized of its native life forms.

More than forty Phoenix-area activists responded to LIVING RIVERS' call for support for action on behalf of the Grand Canyon. Michelle Harrington with the Center for Biological Diversity spoke of the plight of native fish in the Grand Canyon. "Three of the canyon's native fish species have disappeared, a fourth is in serious trouble, and a fifth should probably be listed," she said. "Worse, the only population of endangered humpback chub in Grand Canyon is now experiencing a sharp decline."

Dr. Robert Witzeman of Maricopa Audubon Society and dean of Arizona's conservation community, spoke of the complex web of life in the Grand Canyon ecosystem and the evidence that it is becoming unraveled, beginning with the very base of the food chain. He ended his speech with advice for forcing action from the powers-that-be: "Constant pressure, constantly applied." When the AMWG convenes again this summer, LIVING RIVERS will be there again, with an even larger coalition.

Living Rivers Currents 02/01/02

Dam Re-operations: Avoiding the Inevitable

As citizens lament the failings of ongoing federal efforts to protect Grand Canyon from the impacts of Glen Canyon Dam, they should recognize that these problems won't readily go away.

Instead of addressing the inevitable need to decommission the dam to restore native habitat for endangered fish, the Department of the Interior is spending millions of dollars tinkering with minor changes in dam operations, while the riverine environments that these programs are designed to improve, only worsen.

The Glen Canyon Dam re-operation program is a flagship—for a fleet of dam re-operation programs that are sinking the possibility of habitat restoration for critical environments downstream. The Bureau of Reclamation is at least a year behind in releasing its draft plan for changing Flaming Gorge Dam operations, to mitigate impacts on endangered fish in the Green River through Dinosaur National Monument. The agency is perhaps even farther behind in publishing its re-operation plan for Navajo Dam on the San Juan River. A plan for the Gunnison River dams, expected in 2001, has never yet materialized.

One reason for the failure of these efforts is the raft of antiquated laws and the overweening political interference from user groups that unnecessarily impair managers' best efforts to apply a full range of adaptive management techniques. If these newer programs were intended to benefit from what's being learned with Glen Canyon, there should be little wonder that they all seem to be faltering.

Dam re-operation will be one of the topics at the 2002 Colorado River Symposium in Santa Fe, however, the topic on the agenda should instead be dam decommissioning.

Federal programs have yet to demonstrate any results in their hypothesis that these facilities can be operated in such a way to reverse, or even halt, the extensive habitat decline they've already caused.

This is why the movement toward decommissioning federal hydropower facilities is building rapidly. "The federal government requires private dam owners to evaluate decommissioning alternatives when their projects come under review," said Dr. Patrick Diehl with the Sierra Club's Glen Canyon Group. "Yet the politicians fight against decommissioning studies when their own sacred-cow projects like Glen Canyon and Flaming Gorge are put under the microscope."

Living Rivers Currents 02/01/02

Colorado River Compact In the Way of Delta Restoration

The Colorado River Compact of 1922 was negotiated by the seven basin states without input from Mexico or Indian tribes. When the river flows were parceled out, only about ten percent was allocated to Mexico, a quantity formalized by treaty 22 years later. Mexico currently uses its entire share for agricultural and urban needs. This has had a profound effect on the Colorado River delta. With so little water moving across the border, and Mexico's growing demand for it, the delta today receives no water.

"It should not be Mexico's sole responsibility to fix the delta when the US takes so much of the river's flow from them," said LIVING RIVERS' Lisa Force, who is leading efforts to get water users throughout the Colorado to donate one percent of their water to delta restoration. "The delta's native Cucupá communities, along with all Indian tribes were excluded from this allocation process; it's time to renegotiate."

The plight of the delta also illustrates another major flaw in the Compact: no allocation provisions were made for flows and river management strategies to protect the environment. The Compact pre-dated such concerns, but today, critical habitat—from the river's headwaters to its delta—suffers from lack of water.

While interest in delta restoration grows, and water agencies express interest in assisting, the Compact and other laws governing the Colorado River make such support difficult, if not impossible. Water conserved and left in the river by one agency may be freely diverted by another user downstream. Moreover, if it is proven that a user routinely leaves water in the river, that user's rights to the water may be lost altogether by not putting the water to "beneficial" use.

LIVING RIVERS has requested on behalf of the Delta Restoration Coalition—a group of 133 organizations representing more than 12 million people—that the Secretary of the

Interior examine the Compact and other laws governing the Colorado to identify opportunities to deliver water to the delta. The Secretary, as the arbiter of water allocations in the lower basin, has great discretion to interpret the Law of the River.

As an initial step, reforms should recognize in-stream flows as a beneficial use throughout the basin and across borders. Effective mechanisms are needed to offer water users assurances that conserved water will be protected from appropriation by other users, and allowed to become part of a dedicated, basin-wide system of in-stream flows that would replenish the delta.

In his December 2001 address to the Colorado River Water Users' Association, Assistant Secretary of the Interior Bennett Raley stated that Colorado River delta issues are among his Department's "top priorities" for the coming year. The Interior Department must join with those seeking new and innovative ways to address today's pressing environmental and social needs of stakeholders, not continue perpetuating the mistakes of the past.

Living Rivers Currents 02/01/02

Bishop's Lodge: Return to the Scene of the Crime

Water lawyers, politicians, representatives from Indian tribes and environmental interests will be gathering in Santa Fe, New Mexico early this month for the 2002 Colorado River Symposium at historic Bishop's Lodge—site of the 1922 negotiations for the Colorado River Compact. While various management challenges for the once-mighty Colorado will be on the agenda, LIVING RIVERS will be promoting fundamental changes in the Compact itself, to bring Colorado River laws up to date with present concerns.

From the exclusion of Indian nations, Mexico and the environment as equal stakeholders in the river's water, to apportioning more water to the states than actually exists in the river most years, the Compact's shortcomings are so significant that one wonders why it was not revisited sooner.

"The Compact was flawed from the beginning," said University of Kansas environmental historian and western water expert Dr. Donald Worster. "All kinds of laws dating to the 1920s have been reassessed—including Prohibition and civil rights—so why not western water laws?"

But to many, the Compact has acquired sacrosanct status. Added Worster, "An agreement like this is thought by some to have come from the hand of God; there is an enormous cultural resistance, particularly if someone is going to lose some money in the deal."

Despite such obstacles, attempts have been made over the years to find solutions, and the discussion seems to come back to Santa Fe and the Compact. In 1983 a group gathered at Bishop's Lodge to debate many of the same issues on the table at this year's meeting. "The underlying thrust was a revisionist effort," said University of California, Santa Barbara environmental ethicist Dr. Roderick Nash, a 1983 participant. "Coming together was evidence of dissatisfaction." Yet despite a list of suggested improvements—including amending the Compact—little has been done to address the fundamental problems.

In addition to environmental problems, serious concerns about representation have been in the forefront of discussions about amending the Compact. Compact negotiators simply ignored the issue of reserved rights for Indian tribes, recognized by the U.S. Supreme Court in 1908. Only one reference to Indian rights appears in the document, stating that the agreement does not affect federal obligations to Indian tribes. "Herbert Hoover called that clause the 'wild Indian article,'" said historian Dr. Norris Hundley of the University of California, Los Angeles, an expert on southwest water history and law. "They didn't pay any attention to Indian rights."

Indians today see water that rightfully belongs to their people being delivered to corporate farms and cities hundreds of miles away, while many on the reservation still must haul their drinking water in buckets. Some scholars believe the Navajo Nation alone has rights to several million acre-feet. While some Indian nations have pursued negotiated settlements to obtain water, the usual result has been that the tribes are forced to make significant concessions to obtain water deliveries.

Dr. Helen Ingram, of the University of California, Irvine, presented a paper at the 1983 conference calling for equitable re-allocation of Colorado River water. Today she expresses concern that the momentum for change is hampered by differing strategies within the environmental movement itself. "Some groups think that the best way to protect environmental values is by privatizing water rights and using markets but this won't work for Indian tribes," she said. "It's been an enormous disappointment that environmental groups have walked away from water battles. Before we change the Compact we have to change the environmental movement."

River News 02/04/02

BuRec invitation to 100th anniversary celebrations

United States Department of the Interior
BUREAU OF RECLAMATION
Washington, D.C. 20240

IN REPLY REFER TO: W-1540

Dear Friend:

It is with great pride that I announce the Bureau of Reclamation's upcoming Centennial Anniversary on June 17, 2002. From that date through June 17, 2003, we will be celebrating 100 years as a Federal bureau dedicated to supplying the Western United States with vital water and hydroelectricity supplies.

Congress established the Bureau of Reclamation on June 17, 1902, to provide for the irrigation, storage, diversion, and development of water that ultimately made settlement of the West possible. Today, Reclamation has more than 180 projects located throughout the 17 Western States. Our facilities provide agricultural, municipal, and industrial water to about 33 percent of the West's population; hydroelectricity for more than 4 million households; and recreational opportunities at over 300 sites. We also have a wide variety of partnerships with other Federal, State, and local government entities; Native American Tribes; stakeholders; customers; and other interest groups to address the often-competing needs for the West's limited water supplies through water conservation, reuse, marketing, and other innovative methods. As a contemporary water resources management agency, we believe that, by collaborating and cooperating with all water users, Reclamation can successfully continue to serve in our role as a steward of the West's valuable water resources.

I would like to extend a personal invitation to you to join Reclamation employees in celebrating this occasion. With events being planned by our regional and area offices throughout the 17 Western States during our Centennial, numerous opportunities will exist for you to participate. For more information, please contact one of our offices in your local area. A contact listing is enclosed.

I look forward to your participation at one or more of our upcoming events.

Sincerely,

/signed

John W. Keys, III Commissioner

Undamming National Parks

Vol. 2, No. 3, March 2002

A primary motive for decommissioning several dams on the Colorado River system is to restore habitat in some of the country's national parks and monuments. While concentrating on just a few of these dams, LIVING RIVERS has learned that there are a total of 742 dams affecting our parks, 482 inside Park Service boundaries and another 260 outside.

I'm not sure the public is fully aware of the number of dams in what are supposed to be protected natural areas," says LIVING RIVERS conservation director, John Weisheit. "The idea of dams is wholly inconsistent with the legislation which created our parks."

Few people see these dams, many of which are located away from the parking lots and paved roads. They are for the most part small and quite old, originally built for water supply or flood management purposes. which are no longer critical. Many pose safety risks or are otherwise in disrepair. However, their removal could significantly improve the parks' natural integrity.

With the growing nationwide awareness of opportunities for river restoration through dam decommissioning, it is somewhat surprising that with the exception of a few high profile campaigns, many of these small dams that are ripe for removal have yet to be targeted. "We probably have 150 dams in the park system that we could take out right now, but there is no money available to remove them," says Charles Karpowicz with the National Park Service Maintenance and Operations Safety of Dams Program. The program does remove about four to five dams a year for safety reasons.

Even those dams that are arguably providing benefits, such as the sixty or so generating hydroelectricity, could be decommissioned as their output is relatively negligible. Such is the case on the Elwha River in Olympia National Park. Friends of the Earth is nearing the end of an 18-year effort to remove two dams. They've succeeded in getting the Park Service to purchase the dams for \$30 million, and within three years expect to see endangered salmon again thriving in natural habitat conditions.

"This is how our parks should be," says Shawn Cantrell who has spearheaded Friends of the Earth's Elwha campaign. "We should be eliminating dams like these that do not make sense." Cantrell would like to see the Park Service establish an objective of removing 25 percent of its dams within the next four to five years.

Greg Adair of Friends of Yosemite Valley agrees. "In 1923, the public suffered a major loss with the submergence of Hetch Hetchy Valley in Yosemite National Park, but this damage is not permanent and must be corrected," says Adair. Yosemite's O'Shaughnessy Dam is the most politically challenging facility to remove from the national park system. It is the largest, and like the dams on the Elwha, it is not owned by the Park Service. San Francisco operates it for water storage and generating \$30 million of hydropower revenue annually. "But this is public land, what John Muir described as "More beautiful than Yosemite itself," and the public and the ecosystem deserves to have it back," adds Adair. Adair points out that San Francisco can store its water in neighboring reservoirs, and the power revenues represents a federal subsidy from the Park Service to San Francisco.

"Whether restoring Hetch Hetchy or a tributary stream on the Yellowstone, dams aren't needed and certainly don't belong in our National Parks. It's time we organized to bring this about," concludes Weisheit.

River Guides for the Colorado River

Vol. 2, No. 3, March 2002

In 1996 Colorado Plateau River Guides (CPRG) became one of the first organizations to publicly call for the decommissioning of Glen Canyon Dam. A fairly straightforward action most would assume, but in the complex realm of the river recreation industry, the action so far is unique.

In early days of river running, the river outfitting business was a small-scale seat-of-the-pants business. When dams were proposed, opposition was fierce, albeit not always successful. Lost revenue was certainly a concern, but there was clearly a passion for maintaining wild rivers. As the industry has matured, and the number of new dam proposals ground to near zero, advocacy in the river business has shifted more toward perceiving business opportunities, than for the river itself.

For example, in the 1950s a task force of Western River Guides Association endeavored to stop construction of Glen Canyon Dam. That organization has since evolved into American Outdoors, the nation's leading trade association for outfitters. But despite nearly 100 organizations already on board with the decommissioning of Glen Canyon Dam, American Outdoors has yet to join on.

"The guides, too, are often caught up in the business side of the culture. Guides are generally so happy to be employed as river runners, they are often reluctant to become involved in advocating something their employers are not yet willing to support," says Annie Tueller-Payne, president of CPRG.

Nowhere is this better reflected than amongst the guides in Grand Canyon, whose ecosystem is being destroyed by Glen Canyon Dam. Now, six years after CPRG called for decommissioning, only 34 percent of the Grand Canyon guides believe there is enough information to support such a position.

Payne continues, "They've lost their beaches, the native fish are dying, and the rapids never change. Flows that once fluctuated from 4,000 to 90,000 cfs now fluctuate little beyond 8,000 to 20,000 cfs. Where is their environmental ethic? I guess more of our education needs to be directed down there."

"Such advocacy work is now unprecedented in the guiding community. No river industry group has ever provided such leadership in putting river resources first," says David Focardi, vice-president of CPRG. "We want to walk the talk. River guides have a captive audience of people who vote and guides need to capitalize on this. No other group has the ability to advance this campaign forward than do river guides. The guides need to know the issues about river ecosystems and how to protect them. They also must be

able to answer the questions about ecosystem restoration and CPRG will be there to provide them with that information.”

In May, LIVING RIVERS will be welcoming CPRG as one of our sponsored projects.

You will be able to find information about their programs at www.riverguides.org.

LIVING RIVERS will also be welcoming the formation of [River Runners for Wilderness](#), whose mission is to promote wilderness river corridors within the Colorado watershed. We're pleased to be supporting increased river advocacy within the river recreation industry and look forward to further partnerships like these that strengthen the movement to bring about the Colorado River's protection.

Living Rivers Currents 03/10/02

Reclaim the Bureau

Vol. 2, No. 3, March 2002

While activists begin organizing for the upcoming centennial celebration of the Bureau of Reclamation, on June 17, the agency itself has finally begun circulating information on its own plans. A letter circulated by Commissioner John Keys near the end of February did not elaborate on the details, but stated that events are being planned by regional and area offices throughout the 17 Western states that will span the twelve months between June 17, 2002 and June 17, 2003. According to the letter, the public is invited to participate.

For information contact: Mr. Brit Storey, Reclamation Wide Centennial Committee, (303)445-2912, . Although not noted in the letter, a coalition of water and power interests has been working to secure \$900,000 to aid in a major celebration at Hoover Dam on June 17, 2002. The event is to include “high-ranking” representatives of the Bush administration. It is unclear whether the public is invited to attend.

LIVING RIVERS is promoting a region-wide day of action for June 17, to ensure that the media and the general public are aware of the true impacts associated with the BuRec 100-year dismantling of the West's river corridors. Rallies, river memorials and candlelight vigils are some of the events being contemplated.

For additional information contact LIVING RIVERS' Moab office.

Making the Green River Wild & Free

Vol. 2, No. 3, March 2002

Nearly fifty years ago, one of the most celebrated campaigns in the history of river advocacy began. The Sierra Club, Wilderness Society and the Izaak Walton League successfully fought to protect Dinosaur National Monument on the Green River from inundation by the proposed Echo Park and Split Mountain dams. Despite that victory two other dams were constructed above Dinosaur. This summer LIVING RIVERS will be ramping up efforts to eliminate these two dams to bring about one of the longest dam-free rivers in the continental United States.

As reported on previously in LIVING RIVERS Currents, the Bureau of Reclamation (BuRec) plans to release a draft environmental impact statement for its plans to alter the operations of the 502-foot-high Flaming Gorge Dam in an effort to correct the dam's impacts on endangered fish habitat in Dinosaur National Monument downstream. We've recently learned that this document will be published in late summer, and despite the demands of LIVING RIVERS and the sixty environmental organizations which supported us, BuRec will not evaluate the decommissioning of this dam as one of its alternatives to achieve the necessary mitigation.

The Bureau is violating the spirit of the National Environmental Policy Act," says Brian Dunkiel, staff attorney with Friends of the Earth. "Dam decommissioning is being supported by the Army Corps of Engineers, the Federal Energy Regulatory Commission, and a number of state agencies as a means to recover endangered species. The Bureau has a legal obligation to consider this as a reasonable and scientifically defensible alternative for endangered fish recovery on the Green River."

Unfortunately, this was not a surprise. LIVING RIVERS had anticipated the need to be prepared to mobilize the legal resources to ensure this matter be properly addressed by the courts. Removing Flaming Gorge Dam alone, however, will not be enough to reestablish native fish habitat in Dinosaur National Monument, because a much smaller dam upstream of Flaming Gorge duplicates the problem. The 139-foot-high Fontenelle Dam must also be decommissioned. Its 29-mile reservoir stores only 1.3 percent the amount of water of the reservoirs behind Glen Canyon or Hoover dams, and its 10MW power generation represents slightly more than half that of the two dams currently being slated for decommissioning in Olympia National Park. Moreover, its earthen structure has been plagued with leaks since its completion. Therefore, advocating Fontenelle's removal will generate negligible controversy relative to Flaming Gorge upstream.

The Sierra Club et.al. succeeded in protecting Dinosaur National Monument from inundation a half century ago, but failed to prevent the slow death of its riverine habitat by dams upstream, says LIVING RIVERS executive director, Owen Lammers. "We hope, however, that the same nationwide enthusiasm and passion can again be mobilized on Dinosaur's behalf, leading to further success."

Lasting protection for Dinosaur National Monument is critical, but the removal of these two dams will also pave the way for re-opening discussions for a Green River National Park. This nearly 500-mile-long river corridor was proposed for protection prior to BuRec's interests in the Green River. Nearly all the land remains in the public trust; thus, establishing the nation's longest park would indeed be viable and a fitting testament to the work and vision of the environmental leaders of the past.

Living Rivers Currents 03/10/02

1% Campaign Turns One

Vol. 2, No. 3, March 2002

At just one year old, LIVING RIVERS' 1% for the Delta campaign has grown some serious teeth. The campaign is now backed by a coalition of 133 groups representing 12 million people and has been the subject of over thirty television, radio and newspaper stories including the nationally broadcast News Hour with Jim Lehrer. The simplicity of the 1% voluntary contribution from major Colorado River water users, equaling one percent of the river's flow to begin reviving the delta region, is what has made it so attractive.

At the prestigious Water Education Foundation meeting, held outside Santa Fe, New Mexico, the 1% campaign was referenced repeatedly by speakers from across the country. All this interest has helped draw the attention of the Department of the Interior, which deemed the delta a top priority, yet is moving cautiously. It does support using U.S. technical assistance, but not the necessary contribution of U.S. water of even the tiniest proportion.

During the conference, Bennett Raley, Assistant Secretary of the Interior, met with LIVING RIVERS' Lisa Force and other environmental activists about reviving the dying delta. No agreements have been reached, but further discussions are planned when Raley and Force meet in Eugene, Oregon this month at the Land, Air and Water Conference sponsored by the University of Oregon Law School.

LR Letter 03/14/02

To Utah Governor Mike Leavitt on State of Utah's Rivers

Governor Michael Leavitt 210 State Capitol Salt Lake City, Utah 84114

Dear Governor Leavitt,

Attached please find a copy of LIVING RIVERS' 2002 State of Utah's Rivers report. As river stewards gather around the world on this, the 5th International Day of Action Against Dams and for Rivers, Water and Life, we are heartened that the Utah legislature is exercising increased caution with regard to unnecessary water projects, such as the Bear River dams. It is also encouraging to see mounting public interest in restoration efforts to repair the damage past projects have caused.

What is most promising, however, is the evolving dialogue concerning water conservation. As you noted last summer, even if Utah focused exclusively on developing all available water supplies, not enough water exists to service projected future demand. Managing the state's water consumption is the only way to buffer against shortages like those anticipated this year. Water conservation policies are also the most cost effective means to bolster supplies for both the short and long term. Utah's per capita water consumption is the second highest in the country after Nevada, indicating significant opportunities for improved water use efficiency should appropriate incentives be offered.

Sustained progress in water conservation will also allow for the preservation and restoration of key elements of Utah's natural heritage—its rivers. As a leader within the Colorado River watershed, you are undoubtedly aware of the increasing strain the basin's water consumption practices place on river habitat. Arizona has sacrificed nearly the entire Salt and Gila river system to diversions. Water seldom reaches the Colorado River delta and the Gulf of California. Riparian habitat throughout the watershed is suffering, and Utah is not immune. More diversions planned for the San Juan River and Green River tributaries signal dry streams ahead. Reduced water consumption must become a priority if these rivers are to be sustained.

LIVING RIVERS is committed to river protection through water conservation. Increased water efficiency will eliminate the perceived need for many projects, such as the St. George Pipeline or the Narrows Dam. Energy efficiency, too, can help to replace destructive hydroelectric projects, such as on the Bear River, American Fork and Boulder Creek, not to mention help to revive critical habitat in Dinosaur National Monument from the impacts of Flaming Gorge Dam.

Greater balance can be achieved in meeting ecological needs, as well as our own, from what rivers have to offer. That is the theme of the enclosed report as it highlights issues affecting river management across the state. We look forward to your feedback.

Sincerely,

Owen Lammers
Executive Director

Rally for Utah's Rivers

State of Utah's Rivers Report Released at State Capital on Day of Action Against Dams

CONTACT: Owen Lammers 435-259-1063

As river advocates from around the world gathered for the [5th Annual International Day of Action Against Dams and for Rivers, Water & Life](#), Utah environmental leaders from across the state joined Living Rivers in the release of a report on the [State of Utah's Rivers](#) [272k PDF File].

With the theme of adapting lifestyles to rivers, not rivers to lifestyles, the report laid out the good and the bad happening to the rivers in Utah.

"We're quite pleased that efforts are underway to kill two dams proposed for the Bear River Valley, and that water conservation is now on the tongues of elected officials," said Living Rivers executive director Owen Lammers. "But Utah's quest to continue consuming water at a per capita rate higher than 48 other states, will soon cause our rivers to run dry.

Among the report's highlight:

Bill passed and ready for Governor Leavitt's signature to cancel plans for two dams in the Bear River Valley.

Media coverage of the need for water conservation, and Governor Leavitt's support for the role water conservation must play in Utah's present and future water management strategies.

Momentum to move a radioactive waste pile from the banks of the Colorado River in Moab to a less environmentally vulnerable location.

River restoration projects on the Provo and Jordan rivers, and Moab's Mill Creek. Habitat degradation on the Green River through Dinosaur National Monument as a result of Flaming Gorge Dam.

A proposed pipeline from Lake Powell reservoir to St. George.

The dewatering of the San Juan River.

Sediment build-up impeding river access at the top of Lake Powell reservoir.

The decline of East Canyon Creek's premiere trout fishery around Park City.

The destruction of southern Utah's only natural hot spring.

Small hydroelectric dam re-licensing impeding river restoration.

Protecting rivers on national forest lands, and ensuring the management of rivers as wilderness in designated and proposed wilderness areas.

Two awards were presented. The 2002 "Utah River Stewardship" was presented to reporters Jenny Brundin and Vince Pearson of KUER public radio for their three-part documentary ["Soaking The Desert, the Story of Water in Utah."](#)

The 2002 "Rivers be Dammed Award" went to Ron Thompson, director of the Washington County Water Conservancy District, for promoting the yet funded 200-mile pipeline from Lake Powell reservoir to St. George Utah to maintain per capita water consumption in Southwest Utah as the highest in the U.S., 335 gallons per person per day.

The report was sent to [Governor Leavitt](#) with copies to the Utah Congressional delegation and state house and senate members.

In addition to Living Rivers, other organizations participating include: Colorado Plateau River Guides, Escalante Wilderness Project, Great Salt Lake Audubon, Rim-to-Rim Restoration, Sierra Club Glen Canyon Group, Trout Unlimited, Utah Environmental Congress, Utah Green Party, and Utah Waters.

SL Tribune: San Juan River Choking On Sediment, Groups Say

THE ASSOCIATED PRESS

Water diversions have left the San Juan River choking on its own sediment, say conservation groups that issued a report Thursday on the state of Utah's rivers.

Thirty water diversions along the San Juan River have slowed its flow, but it still carries a heavy load of sediment. The silt sometimes blocks the river where it empties into an upper arm of Lake Powell reservoir, said John Weisheit, conservation director for Living Rivers.

Conservationists say the San Juan River will only get worse as more water is taken from it for irrigation and for Albuquerque, N.M.

Native fish are dying off, hatchery fish aren't taking hold and rural towns like Bluff, Utah, that depend on revenue from whitewater rafting could see their economy decline, they said.

The river groups also listed as threatened East Canyon Creek, which springs from the Wasatch Mountains around Park City. Government officials have known for 20 years that development in the Snyderville basin would degrade the trout stream.

Officials were right -- but they didn't do anything to stop shrinking flows and phosphorous pollution. Conservationists say state and federal governments have failed to enforce laws that would have protected East Canyon Creek. The river groups are considering filing suit to force governments to take action.

The inaugural annual report on the state of Utah rivers also came with a "River Steward" award for Jenny Brundin and Vince Pearson, reporters for KUER radio who produced a three-part documentary, "Soaking the Desert: The Story of Water in Utah."

Living Rivers also bestowed a "Rivers Be Dammed" award on Ron Thompson, director of Washington County Water Conservancy District, who was not on hand to receive his plaque. Thompson was razed for promoting a pipeline that would take water from Lake Powell to St. George, Utah.

Ogden Standard Examiner: Leavitt pressured to sign dam bill Group commends Legislature for river resolution

By CHARLES F. TRENTELMAN Standard-Examiner staff

SALT LAKE CITY -- Hoping to encourage the governor to support what the Legislature approved, Living Rivers is praising lawmakers for their decision to block two proposed dam sites on the Bear River.

Thursday in the Capitol Rotunda, the Moab-based river advocacy group urged Gov. Mike Leavitt to sign Senate Bill 92, which was passed by the Legislature in its last session.

The bill removes Honeyville, in Box Elder County, and the Barrens, in Cache County, from a list of potential river dam projects on the Bear River. As of Thursday Leavitt had not signed it.

The state already decided not to pursue building dams in those areas because of public opposition. Opponents said the dams would flood valuable agricultural and wildlife areas as well as Native American and pioneer historical sites.

Owen Lammers, executive director of Living Rivers, said the Bear River proposal is one of several things the group felt Utah was doing right. "Hopefully this is the piece of legislation that will bring about the end of the Bear River dams," which have been a subject of debate for years.

Improved water conservation would also negate the need for more water.

"Utah does not need to bring in more water. There's plenty of water here, it's just a matter of how you use what they have," he said.

Lammers was joined by Green Party Candidate Craig Axford, who hopes to capture Rep. Jim Hansen's seat in Congress.

Axford said stopping the Bear River dams are only a start if Utah hopes to live within its existing supply of water.

"Utah has to realize that, as Edward Abbey said, growth for its own sake is the philosophy of the cancer cell," he said.

He said Utah needs to begin serious water conservation measures now, including metering and charging for all water used.

**Deseret News: Rally backs rivers in West
But we can do better, group at Capitol says**

By Donna Kemp Spangler Deseret News staff writer

It may be a first for Utah environmentalists — showering kudos on lawmakers for pulling the plug on two proposed dams on the Bear River. Environmentalists gather at the Utah Capitol in a rally calling for improved care of Western rivers. Peter Chudleigh, Deseret News But it wasn't all that warm and fuzzy at a rally environmental leaders held Thursday at the Capitol.

"We have to stop adapting rivers to our lifestyle," said Owen Lammers, executive director of the Moab environmental group Living Rivers. "We hope decision-makers will heed that message."

The rally was held to mark the fifth International Day of Action Against Dams. It drew about 30 people from different environmental groups around the state who highlighted the good and bad things that are being done to manage Utah's rivers and watersheds.

Lawmakers were praised for passing a bill that would prevent the construction of two dams in the Bear River Valley. And Gov. Mike Leavitt was lauded for calling on Utahns to conserve water during last summer's drought.

But more needs to be done, environmentalists said. "Utah is the No. 2 most wasteful consumer of water, second to Nevada," Lammers said. "We can do better."

Craig Axford of Utah Environmental Congress and Green Party candidate for the 1st Congressional District seat proposed doing away with the current water pricing system that relies heavily on taxes. "Utah has to begin billing according to consumption," he said.

Alfalfa farmers were blamed for much of the water use. "The amount of water used to grow alfalfa is stupid," added Denise Boggs, executive director of Utah Environmental Congress. "There's no reason to grow that crop in the arid West."

She also criticized federal land managers for not doing enough to protect watersheds. "All of the headwaters to municipal drinking water are found in the six national forests in Utah. Yet they are all threatened by logging and oil and gas drilling."

On the bad side of things, environmentalists pointed to:

- A long-standing but unfunded plan to construct a water pipeline from Lake Powell reservoir to provide water to a growing St. George area. Environmentalists lambasted Ron Thompson, director of the Washington County Water Conservancy District, for promoting the \$250 million project by presenting him with the "Rivers Be Dammed Award." Thompson, who wasn't at the rally, did not return press calls.
 - Too much sediment in the San Juan River causing a problem for river runners who get stuck in the mud, according to John Weisheit of Living Rivers. Some 30 diversions of water upstream have lowered the San Juan River, a threat to the reproduction of endangered fish.
 - Water releases from Flaming Gorge Dam causing problems for native plants and animals that live in Dinosaur National Monument on the Green River. Later this year, the Bureau of Reclamation will be proposing changes in the dam's operations. But de-commissioning Flaming Gorge Dam was not an option studied, environmentalists argued.
 - Too much pollution in East Canyon Creek in the Snyderville Basin around Park City. Darrell Mensel, coordinator of the relatively new group Utah Waters, blames it on overdevelopment. "I find no other place that's been more disgraceful of a river than East Canyon Creek," he said. He encouraged the governor and lawmakers to make sure environmental laws are followed to protect the creek, once known for its prime trout fishing.
-

Take Action 04/05/02

Arizona Game & Fish Commission Approves Cougar Slaughter

Arizona's cougars are under attack by a state Game and Fish Commission and Department which are more interested in helping hunters and wealthy ranchers to kill predators than they are in protecting wildlife. Even in deficit budget years, such as 2002 and 2003, when the legislature must cut spending by \$200 million and \$1 billion respectively, the subsidy for killing wildlife remains firmly in place.

36 COUGARS TO BE KILLED

The AGFD is now planning to kill seventy-five percent of the cougars - up to thirty-six individuals - in the Four Peaks Wilderness Area on the Tonto National Forest over the next three years. To trap the animals, AGFD will use snaring, a brutal technique that will result in the death of dependent kittens through starvation, exposure or predation while the trapped mother looks on.

The AGFD claims the experiment is necessary to determine the role of cougars on a declining bighorn sheep population. The AGFD's own data, however, show that the population is actually increasing and that the primary causes of bighorn deaths are disease introduced by domestic sheep and drought.

More than eighty percent of the individuals and groups commenting on the Draft Environmental Assessment opposed the project. The former chief of the AGFD's research division along with other qualified scientists condemned the experiment as "ill-concieved, unnecessary, wasteful and bad science."

PROJECT PROPOSED BY TROPHY HUNTERS

Hunters speak louder than scientists to the Commission, however. The project was first proposed by the Arizona Desert Bighorn Sheep Society which hunts bighorns for trophies. The group contributed \$150,000 to pay for the project, obviously designed to increase the number of bighorn sheep available to be killed by trophy hunters. The snaring and killing may begin at any time, as approval to implement the plan was given in January, though the public wasn't notified until March. The Game and Fish Commissioners originally approved the plan in 1999.

TAKE ACTION

There's still time to stop this outrageous attack. Please call, or send a letter or fax expressing your opposition to:

Michael Golightly, Chairman AGFC c/o Director Wayne Shrouffe 2221 W. Greenway Ave. Phoenix, AZ 85023-4399; 602-942-3000 Phone 602-789-3299 Fax

If you would like to volunteer for this or other campaigns in defense of Arizona predators, or if you have information which may help in the campaign to end rancher subsidies for predator control, please contact Living Rivers at 480-990-7839.

River News 04/11/02

APS Announces Intent to Surrender Childs-Irving Power License

In a letter dated March 29, 2002, Arizona Public Service (APS) announced its intention to submit to the Federal Energy Regulatory Commission (FERC) a Surrender Application for the Childs-Irving Hydropower Plants at Fossil Creek. The Surrender Application will supercede the current application that APS has before FERC, which is a request to continue operating the plants, thus devastating the ecosystem, for another 30 years

The written intention to surrender is a milestone in a process which began more than five years ago when a coalition of environmental groups began putting pressure on APS to abandon its effort to relicense the plants. The plants produce a miniscule amount of power in comparison to the major damage they wreak on Fossil Creek, a perennial stream in the central Arizona desert.

After years of negotiations, public pressure and grassroots action, APS signed an agreement to decommission the plants in September 2000. However, with FERC unsure about how to proceed in the unprecedented situation and with California's energy "crisis" heating up, some parties to the agreement began to waiver. It was suggested that decommissioning Childs-Irving may not be in the public interest, and APS's request to continue operating Childs-Irving remained on FERC's desk.

Following a declaratory order in which FERC resolved many of APS's concerns, FERC asked APS to submit a plan for surrendering the license. APS responded that it was unwilling to do so at the time. (See previous Fossil Creek update.) FERC responded with a request for a conference call with APS and other interested parties.

Living Rivers and the Yavapai-Apache Nation, formal Intervenor in the process, as well as a number of other environmental groups joined the call to assure APS that we are all still involved and highly motivated to see the decommissioning through. APS responded with a letter which included the following vital statement:

"As discussed during the March 6, 2002 teleconference between Arizona Public Service (APS), the Federal Energy Regulatory Commission (FERC) and interested parties, APS hereby informs FERC that it plans to submit the surrender application on or before April 30, 2002. The Surrender Application will support the Offer of Settlement and Settlement Agreement submitted by APS to FERC on September 15, 2000. The Surrender

Application will also contain a schedule for the submission of additional required information."

Potential roadblocks remain. FERC could deny the surrender request; FERC could require substantial changes to the Agreement, giving the parties the option of backing out; the U.S. Fish & Wildlife Department could require substantial investments in environmental studies putting an unreasonable burden on APS. But with each baby step forward, Fossil Creek is that much closer to freedom after being entrapped in metal flumes, concrete tunnels, holding ponds, reservoirs and man's icy grip for over 100 years.

LR Letter 04/14/02

Comments on proposed Antelope Point Marina Resort at Lake Powell reservoir

April 14, 2002
Ms. Kitty Roberts
Superintendent
Glen Canyon National Recreation Area
National Park Service
PO Box 1507
Page, AZ 86040

Via Fax: 928-608-6212

RE: Antelope Point Marina Resort Development Project Environmental Assessment

Dear Ms. Roberts:

Living Rivers, on behalf of American Canoe Association, Bluewater Network, Center for Biological Diversity, Colorado Plateau River Guides, Diné Bidziil Coalition (representing 17 grassroots Navajo groups), Diné Medicinemens Association, Flagstaff Activist Network, Forest Conservation Council, Forest Guardians, Friends of Arizona's Rivers, Glen Canyon Institute, Grand Canyon Private Boaters Association, Great Salt Lake Audubon Society, Sierra Club, Utah Environmental Congress, Utah Rivers Council, and Utah Whitewater Club, submit the following comments on the *Antelope Point Marina Resort Development Project Environmental Assessment* dated March 20, 2002.

At the outset, we must stress our dissatisfaction with the public notification and comment periods established for review of this Environmental Assessment (EA), and project evaluation process as a whole. The publication was made available for distribution one week in advance of the public workshop and not received until four days prior to that scheduled public workshop. Similarly, short notification was granted for the scoping workshop. Less than 20 workdays has been available for public comment on this document. This is wholly inconsistent with the spirit of public participation as defined

by the National Environmental Protection Act (NEPA) and the Council on Environmental Quality (CEQ) guidelines.

Summary

Significant procedural issues exist with respect to compliance with sound planning objectives and the requirements of NEPA that have not been adequately addressed in the EA.

Overall, we find the National Park Service (NPS) negligent in promoting the Antelope Point project at this time, as it should first update the Park's outdated General Management Plan (GMP), addressing current and future recreational and resource protection needs at Glen Canyon National Recreation Area (GCNRA). This document is out of date and out of step with declining trends in flat water recreation, concerns with regard to water quality, and the increasing role sediment accumulation is playing in reducing the reservoir's operating life span. The agency should also complete, prior to moving forward on Antelope Point, the Environmental Impact Statement (EIS) currently in preparation on personal watercraft (PWC) management at Glen Canyon. Approval of this project by the Park Service would mark a setback for the Park's efforts to protect water quality in the reservoir, ultimately a drinking water source for more than twenty million people downstream.

Living Rivers and seven other non-governmental organizations requested, in a letter (attached) to then Acting Superintendent Kathryn Cook, and dated November 30, 2000, that an EIS be prepared for this project. Citing several examples of environmentally damaging actions, which would result from NPS approval of the marina and resort, we pointed out that an EIS would be required under the NEPA statute and its implementing regulations by the CEQ. We find the EA, as presently prepared, inadequate, addressing few of the issues raised in our previous letter on this matter. We again request that a full EIS be undertaken prior to any further contemplation of this project. Contrary to the EA's findings, the proposed alternative would cause significant environmental impacts and potential impacts, and these must be properly analyzed and evaluated in an EIS.

What follows are the procedural and substantive issues we have with the EA, as well as the Park Service's approach to evaluating the project:

- Coordination with other park planning efforts
- Protection of park resources
- Purpose and need for the project
- Alternatives analysis
- Economic development and social impacts on Navajo people
- Ethnographic resources & sacred sites impacts.
- Cumulative impacts and reasonably foreseeable consequences

- Site constraints and visitor safety issues
- Water quality impacts
- Air quality impacts
- Recreation and noise impacts
- Antelope Island management concerns
- Endangered native Colorado River fish species
- Environmental Impact Statement required
- Public participation concerns

- 1) **Coordination with other park planning efforts** The GMP for GCNRA is more than two decades old (the undated GMP was published in 1979), and does not reflect numerous unanticipated, undocumented visitor use and recreational trends or problems in resource management that have developed since the document's publication. The GMP is the primary document to which both the current Antelope Point planning effort and the 1986 Antelope Point Development Concept Plan/ Environmental Assessment (DCP/EA) were tiered. Park officials have stated in private communications that a new GMP is unlikely in the near future due to lack of funds.
- 2) The GMP lacks substantive, relevant data and analysis of the purpose, and need for a marina at Antelope Point. Because the GMP lacks important, basic information that would inform current planning efforts for Antelope Point, the NPS must address these missing elements in detail within the Antelope Point NEPA process. The situation with personal watercraft is an excellent example.

The proliferation of such machinery was never contemplated in the 1979 plan and now a full EIS is being undertaken to determine how, and if, PWCs should continue to operate on the reservoir. Waiting until this EIS is complete, before moving forward on Antelope Point, would provide an opportunity to incorporate the findings of the PWC study in to the Antelope Point alternatives analysis. One alternative NPS is reportedly considering, in the PWC EIS, is to restrict jet skis from designated areas of the reservoir-to provide "jet ski-free" quiet zones. The narrow, old river channel at Antelope Point, on the south side of Antelope Island, would be an ideal area for such restricted uses. In its alternatives analysis, NPS should consider the value of the Antelope Point area to non-motorized recreation use.

2) Protection of park resources

The laws, regulations and policies that govern management of national parklands, including GCNRA, require the NPS to make protection of park resources a top priority. The Organic Act of 1916 and the Redwood Park Amendments Act of 1978, in particular, require NPS to manage park resources to a "non-impairment" or "non-derogation"

standard. Contrary to the EA's conclusions, a major development project, such as the Antelope Point marina, risks degrading water quality and air quality, significantly increasing noise and visitor crowding, and decreasing opportunities for solitude and low-impact, non-motorized recreation. The need to provide such areas was not fully contemplated when the GMP was developed, but is a critical factor that must now be addressed prior to potentially exacerbating these problems by approving the Antelope Point Marina Resort Development project.

NPS has no legal justification or authority to favor motorized recreation over non-motorized. Given the growing impairment of park resources caused by motorboats, the burden is on NPS to explain how each recreational alternative considered in the broader sense, Antelope Point, Hite Marina expansion and etc., complies with the non-impairment standard. This should be a key component of the revised GMP and which must be addressed prior to any decision on Antelope Point.

Furthermore, as noted in our scoping comments dated January 14, 2002 (attached) related to Hite Marina DCP/EA, GCNRA planners are demonstrating a bias toward further development of park resources for motorized flat water recreation, while ignoring its obligation to maintain access for other users, such as river rafters.

3) Purpose and need for the project

As stated above, the purpose and need for new development in national parks should be justified by, and tied to, the Park's GMP. However, the Park's outdated GMP lacks important information. The Antelope Point EA is addressing a perceived need that is nearly 25 years old. Demand for any new marina development at GCNRA, in close proximity to the existing Wahweap Marina in particular, must be well documented. NPS must show: why existing facilities at Wahweap cannot meet that demand; why a new facility is needed so close to Wahweap Marina when so many public services and facilities would have to be duplicated and; why constructing a new facility would be preferable to expanding existing facilities, especially at a time when visitation is on the decline. As regards to addressing Navajo Nation economic development needs, there are a variety of other, more environmentally and economically sustainable means for GCNRA to accommodate this, as outlined in our letter of November 30, 2000 and noted below.

4) Alternatives analysis

Because of the outdated GMP, the Antelope Point EA failed to analyze possible alternative uses for the site (other than the marina). Given water quality concerns, demand for quiet areas, potential changes in watercraft usage and any demonstrated need for the proliferation of more marina facilities at this time, it is imprudent to restrict such a unique area as Antelope Point to the findings of an outdated GMP. An updated GMP may reveal that management alternatives for serving marina demand through (expanded) existing facilities is not only feasible, but desirable, and that alternative uses for the Antelope Point site other than a resort marina development would be a better fit for present and future trends.

The Diné Medicinemens Association, Inc. (DMAI) has proposed that NPS study the possibility of establishing a traditional healing center for Navajo people and others, rather than a marina, on the Antelope Point project site. NPS must consider this proposal in detail. The DMAI represents the interests of traditional religious healers and cultural practitioners, whose interests must also be protected and respected under Executive Order 13007, Indian Sacred Sites (May 24, 1996). The DMAI, and other Navajo groups, could contribute significantly to a new GMP, whereas such voices were absent 23 years ago. This would seem particularly important in the case of Antelope Point. The alternatives some Navajo interests have proposed were never contemplated by the 1979 GMP, and not inconsistent with NRA goals. Such uses might include traditional healing centers, retreat/conference center and educational facilities for both local Navajo, and tourists alike.

In addressing NPS' interest in aiding the Navajo Nation, the Park Service should not restrict its evaluation to Antelope Point. NPS should consider the possibility of the tribal government taking over management and operation of existing GCNRA marinas including Wahweap. This would meet the economic development criteria without additional environmental impacts.

5) Economic development and social impacts on Navajo people

The proposed marina is being promoted in part as a means of providing economic development opportunities for members of the Navajo Nation, and of the nearby LeChee Chapter in particular. While no one would dispute the need for additional opportunities for tribal members, the EA has not demonstrated how the Navajo Nation's desires for a revenue stream from a project that would negatively impact the Park's shoreline and waters, against NPS' legal duty to protect park resources from impairment. Navajo Nation economic development goals may not always be consistent with park management objectives. If NPS determines that the purpose and need for the project include providing economic development opportunities for the Navajo people, then NPS must demonstrate that legal authority exists for the agency to undertake development projects or other management activities on that basis. NPS must also explain how such projects are consistent with the agency's legal mandates to ensure non-impairment of park resources.

6) Ethnographic resources & sacred sites impacts

The EA asserts that only two ceremonial sites have been identified, and that both do not qualify for National Register of Historical Places, as they were not used prior the inundation of Glen Canyon. Further, the EA states "Despite this determination, an attempt was made to accommodate the needs of the Diné Medicineman's [sic] Association, Inc. and further consultation identified an acceptable alternative to the original ceremonial location."

The Diné Medicinemens Association, Inc. has identified numerous ceremonial and sacred sites in and around the project area. The Association's president, Mr. Thomas Morris, is unaware of any contact with Antelope Point planning officials regarding the

applicability of these or any other sites to the National Register of Historic Places, nor discussions regarding "suitable" alternatives.

NPS must consult with all appropriate traditional practitioners, including the DMAI to address these issues. NPS must explain how it intends to comply with Executive Order 13007, Indian Sacred Sites (May 24, 1996), that requires agencies including NPS to "...accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and ... avoid adversely affecting the physical integrity of such sacred sites." By dramatically increasing visitation to the area, it will become very difficult for NPS to accomplish the objectives of the Executive Order. NPS must avoid damaging any such sites and provide a range of alternatives for ensuring the sites' protection under a range of alternative development scenarios for the project. NPS should publish a full accounting of the consultation efforts and mitigation plans for the archeological, cultural and sacred sites.

Furthermore, it is the position of the DMAI that the Antelope Point Marina Resort Development not be built, but that a traditional healing center be established at that location should NPS be interested in assisting with sustainable economic development on the Navajo reservation.

7) Cumulative impacts and reasonably foreseeable consequences

NEPA requires analysis of reasonably foreseeable consequences of projects and the cumulative effects of specific impacts over time. Development of a new marina would likely lead to additional construction of tourist-oriented business and industry in the vicinity of Antelope Point. For example, the act of providing utility services to Antelope Point—an area that is currently not served by utilities—will create opportunities for additional development and land use changes outside the project boundary, changes that would be very unlikely to occur without the project. The Navajo Nation and LeChee Chapter are reportedly studying the feasibility of building a casino and shopping center along the Antelope Point access road. Such construction, if undertaken, would likely be feasible only if the marina were built.

The EA has not addressed these cumulative impacts, despite noting that the proposed project will increase the area's employment by upwards of eight percent. The EA has not identified the land-use control and regulatory mechanisms that may exist, if any, to limit sprawling strip development in the vicinity of Antelope Point. By approving this project, NPS would be effectively facilitating the development of many additional acres of land on the approach to Antelope Point. NPS must investigate and evaluate these reasonably foreseeable consequences of the Antelope Point project. Issues such as water supplies, power supplies and sewage disposal (that NPS must study for the marina proper) must also be considered in light of likely adjacent development. Basic services such as police and fire protection must have facilities appropriate to the anticipated need over time. NPS must address these infrastructure questions in a quantitative way.

8) Site constraints and visitor safety issues

The EA gave no consideration to the unique geography associated with Antelope Point, as it may affect public safety. Antelope Point is located on the south shoreline of a narrow bend in the old river channel, with the undeveloped Antelope Island on the opposite shore. There is limited space for large watercraft such as tour boats to maneuver in the narrow channel, especially in the presence of other boats. Site constraints make the area prone to potential user conflicts. Because Antelope Point is on a sweeping bend in the channel, line of sight and visibility are reduced. During heavy use periods, any combination of large tour boats, powerboats, houseboats, high-performance "cigarette" boats and jet skis could be in the immediate vicinity, negotiating the narrow, bending channel, on the way to or from the marina. Swimmers, wake-boarders and water-skiers may be in the water. Anglers may stand on the shoreline or fish from boats. Antelope Island's shoreline provides camping and picnicking opportunities, and boats are often tied along the shore. With the establishment of a marina, it is likely that such use will only increase. The potential for serious visitor safety conflicts and boating accidents at Antelope Point appears to be great. The ready availability of alcoholic beverages for sale from the nearby marina would only exacerbate the risk of serious accidents. Vessel fires, a fairly common occurrence at GCNRA, can significantly increase risk of injury to bystanders and boaters, especially in a constricted channel environment with heavy traffic.

NPS must assess the expected near-term and long-term (cumulative) impacts on visitor safety and public health, resulting from funneling a large number of disparately-sized motor vessels into a narrow channel that is frequently used by families and children for water contact sports.

9) Water quality impacts

The reservoir at GCNRA is an artificial feature that is part of the Colorado River, which is in turn a primary source of drinking water for millions of people downstream in Arizona, California, Nevada and Mexico. In addition to its obligation to protect park resources, including water bodies from non-impairment, NPS has an obligation to ensure the protection of water quality at GCNRA for downstream users. This issue was not given sufficient consideration in the EA.

NPS must consider the cumulative downstream impacts resulting from polluted runoff from streets, parking lots and lawn areas entering the reservoir and which may percolate directly into groundwater. Contamination of groundwater supplies at Antelope Point could be potentially disastrous, since NPS is considering onsite wells as the sole source of the marina's water supply system. Combined, the potential for local and downstream impacts associated with water quality warrant a much more comprehensive examination than offered in the EA.

The US Environmental Protection Agency (EPA) has estimated that roughly 25 percent, on average, of the fuel mixture that drives two-cycle motors is emitted through the vehicle's exhaust system, unburned. Two-cycle motors are commonly used at GCNRA in powerboats as well as in PWCs. NPS should be concerned about petroleum pollution

from all powerboats, but especially that from PWCs, where the oily exhaust is essentially injected (mixed) directly into a stream of water (the "jet"), and thence into the reservoir. While open-water areas may offer some advantage in terms of diluting petroleum pollution, the narrow channel at Antelope Point and the anticipated high traffic volume may lead to significant accumulations of petroleum on or in the water, which may be less likely to disperse than more open areas. If such impacts are sufficient to warrant an EIS on PWCs, then certainly a similar level of analysis should be conducted for a major marina development as proposed for Antelope Point.

10) Air quality impacts

The Antelope Point project area is in close proximity to Navajo Generating Station (NGS), one of the largest sources of carbon dioxide and oxides of nitrogen in the Southwest. Data published by the Public Interest Research Group in 2000 indicate that more than 700 pounds of mercury were emitted from NGS in one year. The EA did not sufficiently address the long-term human health impacts of prolonged exposure to NGS power plant emissions on visitors and marina employees; especially those who work a significant portion of their time outdoors, where they would be considered to be at higher risk from long-term exposure.

11) Recreation and noise impacts

The EA discounts the noise impacts as they relate to the objective of a marina resort operation, but as noted earlier, a revised GMP reflecting contemporary issues would generate a greater range of alternatives to be investigated in and around Antelope Point. In particular, GCNRA currently provides no designated "quiet zones" on or near the water for non-motorized recreation activities (e.g., "sea" kayaking, canoeing, swimming or camping). There are virtually no places on the reservoir with more than 1900 miles of shoreline where families and others may enjoy water sports and other recreation activities free from the sights, sounds, and intrusions of houseboats, powerboats, high-performance "cigarette" boats and jet skis. Despite the growing popularity of non-motorized recreation, a legislative mandate to provide for a broad spectrum of recreation opportunities and the generally benign environmental impact of non-motorized recreation activities, NPS has mostly ignored the interests and needs of those who prefer human-powered water sports at GCNRA.

In the case of Antelope Point, the narrow, bending river channel offers ideal conditions for such low-impact, non-motorized recreation. There are few places on the reservoir's shoreline with easy auto access that could easily accommodate these recreational activities with few conflicts with motorboat users. Antelope Point's new launch ramp and close proximity to the town of Page make it perhaps the best choice for a facility that would cater to non-motorized users. Antelope Island, on the opposite side of the channel from the launch ramp at Antelope Point, provides readily accessible camping and shoreline hiking opportunities, while the island's hilly landform offers effective screening from the noise of motorized watercraft traffic traveling uplake around the north side of the island. But just as a "quiet zone" in the Antelope Point channel reach would be protected by the topographic screening afforded by the island, the channel

would likely be subjected to near-constant noise levels if Antelope Point marina were built. The island's topography would tend to reflect noise back to the water and the south shore, virtually guaranteeing that the passing motorboats and tour boats would make camping and non-motorized water sports unpleasant at the very least.

Through a revision of the GMP, NPS should identify and characterize the range of alternatives available within the NRA to provide accessible and adequate quiet zones, such as may be available around Antelope Point. Additionally, noise is a major issue being addressed by the PWC EIS. Noise should receive no less consideration for a major marina development, yet here again NPS has relegated the issue and the entire analysis to EA status.

12) Antelope Island management concerns

In the GMP for GCNRA, Antelope Island is zoned for "wilderness," i.e., non-motorized use. NPS has not analyzed expected impacts that the Antelope Point marina would have on naturalness, wildlife, and primitive camping at Antelope Island. NPS must explain the management rationale that justifies placing a marina in such close proximity to an area that is to be managed in an undeveloped state. NPS must also describe how it intends to ensure that Antelope Island will remain a low-impact, protected environment in light of the heavy boat traffic that will bring additional noise, air and water quality degradation, and people to the area, especially during heavy use periods.

13) Endangered native Colorado River fish species

NPS has an obligation to support recovery of endangered species that are native to the parklands under NPS jurisdiction. In the context of an updated GMP, NPS could consider utilizing the Antelope Point channel zone as a protected rearing area for some or all of the four listed, Colorado River native endangered fish (bonytail chub, Colorado pikeminnow, humpback chub and razorback sucker). Few endangered fish are known to currently inhabit Lake Powell reservoir. The only referenced in the EA was the razorback sucker. These native fish have had their habitat dramatically altered and invaded by striped bass, carp, and other introduced game fish species. While GCNRA has done little to reintroduce listed endangered fish into the reservoir, there are indications that under protected conditions, a limited number of individuals could survive. The razorback sucker in particular survives in low numbers in several lower basin reservoirs, mainly in response to ongoing U.S. Fish & Wildlife Service (USFWS) hatchery rearing efforts. A major challenge in ensuring these fish reach reproducing age is predation by and competition with introduced non-native fish including trout, catfish, bass and carp. In at least one Colorado River reservoir, a screen or curtain has been put in place to separate the endangered native fish from the game fish, and initial reports indicate that the system is working.

NPS should investigate, in collaboration with USFWS, the possibility of creating a similar type of curtain that could be employed at GCNRA (perhaps in a number of locations) to create protected rearing zones for endangered native fish. NPS should give serious consideration to experimenting with the Antelope Point channel area for this purpose. The narrow, deep channel could afford a unique opportunity for providing

at relatively low cost a controlled, easily monitored, predator-free environment. A curtain or screen dropped across the channel on both ends of Antelope Island would provide a very deep area in the old, river channel, as well as extensive, shallower habitat in the Antelope Creek bay.

Pursuing a more detailed study of the potential benefits of such an experiment would require consultation with fish biologists and with the two USFWS-sponsored endangered fish recovery implementation programs in the Upper Colorado River and San Juan River watersheds. NPS should give this consideration in conjunction with future management plans and not unnecessarily compromise potentially suitable habitat like Antelope Point prior to completion of such an evaluation.

14) Environmental Impact Statement required

Given the extensive and controversial nature of the project impacts expressed herein, NPS is required by CEQ guidelines to abandon the EA process and conduct an EIS on the Antelope Point Marina Resort Development Project. There is clear, current precedent for doing so. As noted above, GCNRA is currently preparing an EIS for PWC management. It is difficult to imagine a rationale that would justify an EIS for jet skis while preparing only an EA for a large marina complex. A decision by NPS to move forward with an EA and a Finding of No Significant Impact, without preparing an EIS for this complex project would appear to be an arbitrary and capricious act by the agency.

15) Public participation concerns

Public involvement in planning by federal agencies is a key element of the NEPA process. NPS should endeavor to improve its outreach and public involvement efforts related to the Antelope Point project. In particular, NPS should conduct public hearings on the project in diverse communities throughout the region. NPS must avoid the appearance that it is interested in receiving input from only a narrow demographic audience. The NEPA process requires federal agencies to promote public involvement in project planning. We were therefore profoundly disappointed to learn that, despite our requests for multiple scoping meetings, NPS chose to hold only one such public meeting for Antelope Point and now only one public workshop on the EA, both in Page, AZ. In both instances there was less than two weeks advance notice, which does not typify the sort of public participation effort envisioned by NEPA.

In contrast to what appears to be NPS' intent to restrict the audience for its Antelope Point project, NPS recently held scoping meetings for the PWC EIS in the Salt Lake City and Phoenix metropolitan areas, as well as in Page. There is a growing perception and concern that NPS may be using scoping meetings in an arbitrary and capricious manner. At the very least, there is an apparent lack of consistency in the agency's selection of communities for public involvement activities. NPS should hold future public meetings on Antelope Point in the following locations at least, to ensure a well-informed public: Page AZ, Salt Lake City UT, Phoenix AZ and Flagstaff AZ. Consideration should be given to also conducting meetings in Gallup NM, Moab UT, Durango CO and Las Vegas NV, to ensure broad geographic coverage.

Finally, the quantity and quality of materials and information about the project provided by NPS to attendees to the scoping meeting, through the EA process and the EA itself has been disappointing. There has been precious little useful information in the materials to explain the controversial nature of the environmental, social and economic impacts of this project. Part of the public involvement process is informing the public well in advance of the issues that have been raised, to encourage additional public response and understanding. NPS should dramatically improve the information provided the public in future communications, on the Internet, via the US Mail, and especially in public meetings.

Thank you for your consideration of our concerns, and we look forward to your reply.

Sincerely,

Owen Lammers

Media Advisory 04/14/02

Arizona and Utah environmental groups support Navajo activists in blasting National Park Service for promoting Lake Powell marina complex on Navajo land.

Contact:
Owen Lammers, Living Rivers (435) 259-1063/206-2590

Hazel James, Diné Bidziil Coalition (928) 779-9322
Mr. Thomas Morris, Diné Medicinemens Association (928) 871-5133
Dave Sherman, Sierra Club Plateau Group (928) 773-1064

In an [eleven-page letter](#) sent today to superintendent Kitty Roberts of Glen Canyon National Recreation Area (GCNRA), Living Rivers and 17 other environmental and social justice organizations demanded suspension of the planning process for the proposed Antelope Point Marina project on Lake Powell reservoir.

Citing numerous violations of the National Environmental Protection Act (NEPA), utilization of outdated planning guidelines, a bias toward servicing motorized flat water recreation, and failure to consult with Navajo interests, the groups called for a revision to the Recreation Area's General Management Plan prior to any further work on the Antelope Point Marina proposal.

At issue is GCNRA's proposal to construct a 410-slip marina, 225-room hotel complex, 150-site campground, restaurants, fuel dock, convenience store and related infrastructure over a 950-acre site, 710 owned by the Navajo Nation and 240 administered by the National Park Service. Of major concern is that the project evolved from a 23 year-old planning document which has little relevance to the reservoir's current operation. An Environmental Assessment for the project was released three weeks ago, and today is the final day for the public to submit comments on the document.

The Diné Bidziil Coalition, representing 17 grassroots Navajo groups, and the Diné Medicinemens Association have been in opposition to the project, as it would impact ceremonial and sacred sites, and promote inappropriate development on the Navajo Reservation.

"Their document claims that they consulted with us about the impact on sacred sites, but no consultation ever occurred," said Thomas Morris Jr., president of the Diné Medicinemens Association. Federal regulations require the National Park Service to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners, and to avoid adversely affecting the physical integrity of such sites.

"Our people will derive virtually no benefits from this project, only a few low wage jobs and some lease payments. The bulk of the money flows off the reservation to a non-Indian company in Scottsdale AZ," says Hazel James, with Diné Bidziil Coalition. "Most families on the reservation live near or below the poverty line; we don't have houseboats and jet skis to take to Lake Powell reservoir."

"If anything is to be built out at Antelope Point, it should be a building that is dedicated to traditional healing, not for a building that is dedicated to such vices as drinking, gambling and environmental degradation," says Philmer Bluehouse, of the Bluehouse Peacemaking Institute, and member of Diné Bidziil Coalition. Antelope Point will be the first place alcoholic beverages will be allowed on the Navajo Reservation, and it is anticipated that once the project is underway a casino will be constructed as well.

Despite this proposal being the most substantial development initiative at Lake Powell reservoir in decades, the Park Service has done only cursory environmental analysis, hoping to avoid undertaking a more rigorous Environmental Impact Statement. In contrast, the Park Service is presently conducting a full-scale Environmental Impact Statement on the use of personal watercraft within its jurisdiction.

"The likely impact on water, air, noise, public health, not to mention the cumulative development impacts on the surrounding community compels the Park Service to undertake an Environmental Impact Statement," says Owen Lammers, director of Living Rivers. "But more importantly, the Park Service must reassess the perceived need for this new resort marina in light of declining visitation and other unanticipated management issues not addressed in 1979 when Antelope Point marina was first contemplated."

Indeed, visitation in 2000 and 2001 is off 11 percent at Lake Powell reservoir. There is now demand for non-motorized quiet zones on the reservoir unanticipated in 1979, and Antelope Point affords one of the best locations for such an area. Sediment accumulation is now a major management problem at the top of the reservoir, especially for private and commercial river rafting trips which conclude there. The Park Service is ignoring the need to maintain access for these users, or to address the fact that sediment accumulation is an increasing problem that will eventually force the decommissioning of Lake Powell reservoir. The Park Service should be addressing the sediment problem first, prior to proposing investments in new infrastructure.

"This is merely the latest round of the commercialization of our National Parks," says Dave Sherman, co-chairman of the Sierra Club's Plateau Group in Flagstaff, Arizona. "If the Park Service was serious about promoting economic development for Navajo people, it would work with the Navajo Nation to enable them to operate existing GCNRA concessions, such as those at Wahweap Marina, instead of building Antelope Point, which is wholly unnecessary."

Event 04/15/02

Sedimental Journey -- Reclaim the Bureau/Reclaim Our Canyons, June 13 - 17

Canyonlands National Park • Glen Canyon Dam • Lee's Ferry • Grand Canyon National Park • Hoover Dam

June 17, 2002 marks the centennial of the Bureau of Reclamation. As public officials, large-scale irrigators, and power interests gather to celebrate a century of river devastation at Hoover Dam, Living Rivers and others will be there too, but with a different message. "100 years–600 dams is too much" will be the rallying cry that will conclude a five-day road show aimed at drawing public attention to the extensive environmental damage that is BuRec's legacy.

Nowhere are the problems with BuRec's exploits more apparent than in one of the world's premier national parks, [Grand Canyon](#). Sandwiched between BuRec's two largest dams, Hoover and Glen Canyon, the mighty Colorado, which carved this one of seven natural wonders of the world, has been transformed into the Grand Ditch.

Glen Canyon Dam has changed: the Colorado's natural flows; its seasonal variations in water temperature; sediment and nutrients deposition and fish migration into and out of Grand Canyon. The artery feeding this unique ecosystem is near death. The Canyon's entire food web is being dramatically altered. Three of eight native fish species are gone and two more are on their way. Native vegetation is disappearing at an alarming rate, as are the beaches so revered by the Canyon's river runners—all thanks to BuRec.

On our way to BuRec's official celebration at Hoover Dam, Living Rivers will be launching the first mission of the Bureau of Restoration. Vital sediment not able to reach Grand Canyon will be transported by truck from the upper Colorado watershed around Glen Canyon Dam and deposited at several locations in and around Grand Canyon.

Rallies, press conferences and outreach activities will take place throughout the five-day journey, including its final stop at Hoover Dam on June 17th. Riverside music, cookouts and camping will round out the festivities as we promote the need for BuRec to reverse its policy of shaping rivers to meet non-essential human needs, to shaping BuRec to meet the needs of our dying rivers.

Join the caravan for one or all the events!

Thursday, June 13, Moab, Utah

6:00 - 10:00 pm

River News 04/15/02

BuRec plans for private celebration at Hoover Dam 6/17/02

A \$400,000 private gala is being organized by BuRec for its centennial celebration at Hoover Dam.

2,400 invitations have been sent to acting and retired BuRec employees, elected officials, and leaders within Western water and power interests. The public is not allowed to attend.

Participants will be bussed by BuRec from Las Vegas hotels to the Dam for the evening festivities. The highway servicing Hoover Dam will be closed from 3:00 - 11:00pm.

The event will take place in the Dam on the generator floor, including buffet, speeches, concluding with a fireworks display.

Interior Secretary Gale Norton, and BuRec Commissioner John Keys are the senior-most administration officials confirmed for the event, though both President Bush and Vice President Cheney have been invited.

June 17th itinerary

3:00 pm: Highways to the dam are closed

4:15 pm: Shuttle buses leave the Las Vegas hotels

6:00 pm: Dinner buffet at the floor of the generator gallery

6:30 pm: Thunderbirds air show

8:00 pm: Speakers on the transformer deck (outside)

9:15 pm: Fireworks and laser light show

9:45 pm: Shuttle buses roll
11:00 pm: Highways reopened

Profiting from Powell: Planned 'Antelope' marina splits Navajos; pits environmentalists against Park Service

By Peter Corbett
The Arizona Republic

A planned \$70 million Lake Powell marina and resort at the mouth of one of the world's most photographed canyons has divided Navajos and pitted federal park officials and developers against environmentalists.

National Park Service officials contend that the new marina at Antelope Point is needed to relieve overcrowding at existing marinas within the 1.3 million-acre Glen Canyon National Recreation Area, and they are prepared to approve the project this summer.

The marina is supported by boat enthusiasts, business interests in nearby Page and by the Navajo Nation.

"The facilities at Wahweap (Marina) have been developed to their maximum potential and more services are needed," said Steve Ward, Lake Powell Resorts & Marinas spokesman. Wahweap has a long waiting list for slips, he said.

But a coalition of environmentalists and Navajo groups contend that the marina is not needed, would encourage more noisy motorized boating, do little to help the tribe and could be expanded to include casino gaming.

"This is a good place for canoeing and a quieter recreational experience, and the marina would ruin that," said Randy Rasmussen, acting Southwest regional director of the National Parks Conservation Association.

Proponents say the Antelope Point project would create badly needed jobs for area residents, including tribal members, and would boost tourism.

For environmentalists, a marina at Antelope Point would be yet another nail in the coffin for Glen Canyon and the area's environment. They say they want to protect Antelope Canyon from the buzz of powerboats and personal watercraft.

Visitation at the park last year, 2.3 million, was the lowest in a decade, and 35 percent below the 1992 peak of 3.6 million. Park Service officials said part of the drop is because of a 1995 change in how records are tallied, but they have no explanation for the flatness of the visits since then.

The marina would border part of Antelope Canyon, a deep and narrow maze of finely eroded and twisting sandstone that explodes into a rainbow of colors at midday.

Widely photographed and used in numerous commercials, the canyon made international news in 1997 when 11 people, including several European tourists, drowned during a flash flood.

The decision by the Park Service to develop the marina could have long-term consequences for the management of Lake Powell.

The area has been an environmental battleground since before 1963, when Glen Canyon Dam plugged the Colorado River near the Arizona-Utah line and flooded picturesque Glen Canyon.

By the time it filled in 1980, Lake Powell - the second-largest man-made lake in America - extended 186 miles into Utah in a spider web of 96 canyons, following 1,960 miles of shoreline, longer than the West Coast.

Glen Canyon was first mapped in 1869 by Maj. John Wesley Powell, who during a pioneering journey described it as "a curious ensemble of wonderful features - carved walls, royal arches, glens, alcove gulches, mounds and monuments. From which of these features shall we select a name? We decide to call it Glen Canyon."

Today, nearly 2.5 million people visit the lake annually, with most boats launched from Wahweap and State Line marinas.

In launch mode

The Park Service and Navajo Nation are poised to approve the marina, which would be developed by Paradise Valley-based Antelope Holdings.

The public comment period ended last week and federal park officials say they see no reason not to proceed.

"We're hoping to have signed documents by the end of July," which would allow the developer to start construction as early as this fall, said Kathy Fleming, the park's chief of concessions.

If approved, developer Antelope Holdings would, over five years, build 300 private slips and a fuel dock within the federal park.

A 225-room hotel, campground, store and storage area for boats would follow on adjacent land that the Navajo Nation has sought to develop for 30 years.

Antelope Holdings is headed by David Maule-Ffinch and Jerry Moyes, CEO of Swift Transportation, a Phoenix-based trucking company.

The two men also were partners in an \$18 million marina project at Lake Pleasant and \$23 million marina at Roosevelt Lake.

Building a casino at the site is not something the developers have considered, Maule-Ffinch said.

The Navajo Nation authorized a casino in New Mexico last year, but the tribe does not have a gaming pact in Arizona.

"If it were legal, we would maybe consider it," said Maule-Ffinch, who insists the project will not harm the environment. "I don't know what their (environmentalists') concerns are."

Point of contention

Owen Lammers, director of Living Rivers and head of the coalition fighting the new marina, said that the National Park Service "is demonstrating a massive bias for motorized, flat-water recreation, and pimping for that."

The coalition complains that park officials are skirting federal regulations by not conducting a formal Environmental Impact Statement to study in full the marina's potential harm.

In 1993, a Del Webb Corp. subsidiary paid a \$1 million fine - at the time the largest ever in Arizona for an environmental crime - for the systematic dumping of as many as 100 truckloads of batteries and other debris into Lake Powell.

In addition, ARA Leisure Services, which took over the marina boat-renting concessions from Del Webb's Marina Operation Corp. in 1988, agreed to pay a \$225,000 fine.

Suzy Schulman, the park's environmental specialist, said that a full environmental study is not needed for the new marina because it would not have significant environmental impacts on Lake Powell.

The Park Service is looking at limiting motorized boats, including personal watercraft, in some canyons, she said.

The coalition wants Antelope Point to be one of those areas.

Kayakers explore steep-walled Antelope Canyon where it enters Lake Powell. Hikers trek into the serpentine maze past fossilized dinosaur tracks in a canyon the Navajos consider sacred.

A small boat launch was built at Antelope Point in 1999, but is not used for speed boats now because the lake level is so low, said Steve Cassens, owner of Twin Finn Scuba and Kayaks, a Page outfitter, who supports the proposed marina.

The coalition, which includes the Sierra Club, Diné Medicinemens Association and other boating and environmental groups, questions the need for the new marina, especially since visits have declined.

Instead of building a new marina, the coalition suggests that the Navajo Nation take over the concession contract to operate Wahweap.

"Our people will derive virtually no benefits from this project, only a few low-wage jobs and some lease payments," said Hazel James of Diné Bidzil, a Navajo group in the coalition.

"The bulk of the money flows off the reservation to a non-Indian company."

Thomas Boyd, a project manager in the Navajo Nation's tourism office, said that the marina would create nearly 250 jobs, most during construction and some during ongoing operations.

Unemployment in the area is nearly 44 percent.

Antelope Holdings will be required to follow the tribe's preference laws in hiring contractors and marina workers. The company will have a 20-year lease with a 25-year option, Boyd said.

Media Advisory 04/24/02

BuRec and Interior Move One Step Closer to Killing the Grand Canyon with Glen Canyon Dam

Activists plan "Sediment-al Journey" to encourage Grand Canyon restoration

Contact:

Owen Lammers (435) 259-1063

Lisa Force (480) 990-7839

The Department of the Interior's Adaptive Management Working Group (AMWG) will convene today in Phoenix to discuss yet another proposal to prop up the collapsing Grand Canyon ecosystems. It is the contention of a growing number of environmental groups and scientists that the proposed plan will succeed only in perpetuating the illusion that the Grand Canyon's destruction, brought about by the operation of Glen Canyon Dam, is being addressed.

With the stated goal of helping the Grand Canyon's endangered native humpback chub, water, power and environmental interests will be debating a proposal to implement special water releases from Glen Canyon Dam. The releases are intended to improve the fish's spawning and rearing habitat lost since the dam began operation in 1963.

"Interior's been at this process for twenty years, has spent more than a \$100 million and has nothing but a further degraded Grand Canyon to show for it," says Owen Lammers, executive director of Living Rivers. "They're letting the water and power interests drive habitat destruction and override the public's growing desire for the preservation and restoration of native habitat in Grand Canyon National Park."

The proposed flow regime would be the fourth planned experimental release since 1996. All have failed, as demonstrated by the collapse of Grand Canyon native plant and fish populations and continually eroding beaches. The Canyon's humpback chub population has declined 75% in seven years. In 1992, Congress mandated that dam operations be changed to establish a second population of humpback chub. Yet, management manipulations so far have not even sustained the one current population.

"There's no more time. Minor tinkering of the dam's operation won't help the chub and can't compensate for its overall impact on Grand Canyon's ecosystem," says Roxanne George with the Sierra Club's Plateau Group in Flagstaff, AZ. "Up to ninety five percent of the sediment and nutrients critical for nourishing Grand Canyon's artery are blocked by Glen Canyon Dam."

Lack of sediment has eliminated beaches, changed the carbon base and caused the near disappearance of the Canyon's natural food web. Cladophora (green algae) has replaced wood as the primary carbon-based nutrient for the system. This means that the macroinvertebrate assemblage (insects) is disrupted; that the historic food source for this fish has vanished. Of the 50 to 100 insects native to the Canyon, none remain. Riparian vegetation struggles in the sterile soil. Non-native species have firmly established themselves in this artificial environment, gradually forcing out native vegetation and animal life.

"Manipulating the dam's operations can't change this, nor will it change the chilly water temperatures that have further contributed to the chub's demise and extinction of three of the seven other fish species native to the Grand Canyon," says Michelle Harrington of the Center for Biological Diversity.

Water released into the Grand Canyon from Glen Canyon Dam is a constant 46 degrees F., causing the river temperature to seldom exceed 55 degrees. Native fish require warmer water with temperatures reaching 80 degrees, the natural pre-dam temperature of the water. Moreover, cooler temperatures have allowed cold water fish, especially brown trout, to flourish and prey on young native fish such as the humpback chub.

"The three key things this ecosystem needs are warmer water, sediment and annual high flows to distribute sediment into the system," says Dave Haskell, former science director for Grand Canyon National Park. "The current guidelines and funding do not allow scientists to address these three fundamental elements."

"The Working Group is running out of time to undertake more useless experimentation. A world renowned resource is at stake," adds Lammers. "That's why a growing coalition

of groups will be taking the issue on the road in mid-June to mobilize public support for immediate attention to the Grand Canyon's ecosystem."

The timing of these events will coincide with the centennial celebration planned for the Bureau of Reclamation at Hoover Dam on June 17. The Bureau of Reclamation is principally responsible for the collapse of the Grand Canyon's ecosystem, by first inundating 40 miles of Grand Canyon behind Hoover Dam and then by delivering slower, but nonetheless lethal impacts to the remainder of the canyon through the operation of Glen Canyon Dam.

Embarking on the first "Sediment-al Journey," participants will be transporting sediment via a dump truck from the upper reaches of the Colorado River watershed for deposit into the Colorado River in Grand Canyon. Events will be taking place on the Colorado River near Moab UT, Glen Canyon Dam, Glen Canyon National Recreation Area, Grand Canyon National Park and Hoover Dam.

Motorized Rafting – An Illegitimate Industry?

The 35 Year Wilderness War for Grand Canyon

by Byron Hayes

Published here with permission of the author.

"As long as the commercial passenger gets easier and more preferential treatment than the non-commercial user, you can be absolutely certain that the struggle will never end."
Joe Munroe - June 16, 1980[1]

The Frustrating Reality (1998 - Commercial Revenues \$27 Million; Non-commercial Passengers Wait 20 years)

A 20 year wait to take your own raft down a river, penalties that selectively send you to the end of the line if you go earlier, motorized rafts with helicopter exchanges on America's premier wilderness river, and commercial river operators emphatically insisting that everything is fine and should stay the way it is. Ever wonder how things got to this point and how not just one, but two virtually final non-motorized wilderness decisions somehow evaporated into the described scenario?

This article brings together a unique historical examination of the behind the scene activities that delivered this seemingly incredible outcome into current day reality. It provides a true story of how familial ties and political maneuvering succeeded in facilitating National Park access to those Americans most able to contribute to the Grand Canyon river concessionaires' bottom line. Ignored were existing laws, the public process, and the independent boating public who are now waiting 20 years for river access in the crown jewel of America's National Parks, the Colorado River through the Grand Canyon.

The Park and Public Involvement (1975 - Commercial Revenues \$6 million; Private Wait 0 years)

With the passage of the Wilderness Act of 1964, Congress directed the National Park Service (NPS) to conduct an inventory to determine which of its lands were suitable for Wilderness classification. Multiple segments of the Canyon were under threat of inundation by proposed reservoirs and Glen Canyon Dam was filling up. In 1967 only 2,099 people visited the river, but reportedly "Passengers and boatmen were still scuttling beer cans in the river ('Open them at both ends to make them sink.'), squatting behind big rocks or tall bushes, and burying garbage wherever the sand was soft." [2] Under these virtually unregulated conditions visitation rapidly increased to 16,432 visitors annually by 1972, facilitated by the existence of 22 commercial river companies, many of which operated motorized rafts. [3] It was becoming readily evident that the Canyon was coming under a real and severe threat of damage from haphazard use.

In 1970 the Grand Canyon National Park (GCNP, or the "Park") commenced its Wilderness inventory process with the release of its Preliminary Wilderness Study for Grand Canyon National Park, Marble Canyon National Monument, and Grand Canyon National Monument. [4] In 1969 Congress had already passed the National Environmental Policy Act (NEPA) which required that significant environmental decisions must be considered with the input of those affected. Consequently, public hearings on this Wilderness issue began in May 1971 at Grand Canyon and in Phoenix, Arizona. Additionally, public comments were solicited in newspapers in Williams and Flagstaff, Arizona and in Kanab, Utah. [5] Management of the river corridor was recognized to be an important issue during these hearings. [6] The Colorado River Outfitters Association (CROA) was established to lobby the outfitter's perspective and became an important participant in these hearings.

After compiling the public's overall input, the Hearing Officer explicitly reported, "The desired river experience is felt to be a slow float trip in small parties." However, after recognizing that the existing NPS management directives were to allow continued use of motorized rafts, the hearing officer concluded that "The plan for continued use of motors precludes wilderness classification for the river itself." [7] As a result, the Colorado River was excluded from consideration for inclusion in the Canyon's NPS Wilderness Recommendation despite public opinion otherwise. [8] The Wilderness Recommendation was then forwarded on September 14, 1972 to then President Nixon who officially communicated the plan to Congress on September 21, 1972. [9]

Meanwhile, the Park was continuing to be plagued with the problems caused by the River's rapidly increasing popularity. On December 5, 1972, after soliciting broad and varied public comment, the Park announced adoption of a plan to control the use of the River and the adjacent lands. This Colorado River Management Plan (CRMP) provided for the freezing of commercial user days at the existing level (89,000) and for the complete phase out of motors by 1977. This action functionally removed the basis for the prior exclusion of the river from Wilderness consideration.

On March 20, 1973 Senator Barry Goldwater (R-AZ) introduced (93) Senate Bill 1296 that provided for the enlargement of the Grand Canyon National Park. [10] Included in this bill was a section that provided for Wilderness in the expanded Park that was consistent with the NPS and President Nixon's earlier recommendation which failed to include the river. While introducing the bill, Goldwater acknowledged the new December 5th regulations that removed motorized rafts from the River by stating, ".... I believe it is unnecessary to legislate on this (motorized rafting) matter while it is being resolved administratively." [11] Consequently, under Goldwater's interpretation, the administrative track to phase out motorized rafts by 1977 could continue, but the river corridor would remain outside of consideration for Wilderness protection.

Outfitters Enraged

Needless to say, the recommendation to phase over to non-motorized trips was not greeted with much enthusiasm by the solidly established motorized outfitters. One approach that was pursued by the motorized outfitters was to oppose the NPS decision on the legal front. Western River Expeditions itself brought a suit in Salt Lake City, Utah against the Park Service alleging the decision to eliminate motors was "arbitrary" and that no data had been acquired to support the decision. [12]

Although he generally supported the Western lawsuit, Fred Burke, owner/operator of Arizona River Runners, a motorized outfitter then located at Marble Canyon, took on a political tact in dealing with the motor controversy. Burke had been fighting Canyon Wilderness designation individually, as President of Arizona River Runners, and with the Colorado River Outfitters Association (CROA). Besides political experience derived directly from river issues, Burke had developed significant additional experience by running for a seat on the Arizona state legislature. At that time U.S. Congressman Sam

Steiger (R-AZ) was one of the most prominent supporters of Bridge Canyon Dam, a project that, if implemented, would have put almost a third of the Canyon's river miles under a water.[13] Burke and Steiger each saw any Wilderness designation of the Canyon, and especially the river itself as their mutual enemy. Consequently, they became good friends.

In the course of Burke's unsuccessful November 1972 attempt at a seat in the Arizona State Senate, Barry Goldwater had helped Burke, a fellow Republican, with his commercial campaign spots.[14] Once Burke became aware of Goldwater's bill and his statements in Congress, he contacted Goldwater imploring him to listen to his perspective and those of fellow outfitter Jerry Sanderson and Gay Staveley, the owner/operator of Canyoneers, a completely motorized rafting company located in Flagstaff. Fred requested Goldwater change the wording of his bill to provide for the ongoing use of both motors and oars. He went on to claim that he was opposed to fast trips and that "There is no monetary gain under my plan if motors were left on." [15]

NPS Wants River As "Potential Wilderness"

When hearings on Goldwater's S. 1296 commenced on June 20, 1973, both the Interior Secretary and NPS, the originators of the 1972 Wilderness Recommendation, jointly requested the river corridor itself now be included as an additional 4500 acres of "Potential Wilderness" since motorized rafts were now officially being phased out.[16] NPS Director Ronald Walker stated during the hearings that these new provisions were necessary because the NPS had been allowed "no input" into Goldwater's bill.[17]

Upon hearing the NPS proposal to include the river, the Utah Congressional delegation, which had numerous river company interests at stake, immediately blasted the Park Service for their proposition to phase out motors. Utah Congressman Gunn McKay said that the presence of motors did not shatter the sanctity of a wilderness experience and that the noise they created was only a "technical problem" that would be solved in the future. He also inferred that motors were necessary to safely navigate the difficult rapids and that the larger size motorized rafts provide for the removal of human waste and trash that would otherwise be left on the beaches.[18]

Utah Senator Frank Moss joined the attack on the NPS proposal stating that the absence of motorized trips would effectively remove access to both children and the elderly. Sen. Moss repeated Gunn's accusation that small boats are less safe and promote garbage. Moss discounted NPS Regional Director Howard Chapman's report that a recent hearing in the Salt Lake Western suit had disclosed that motorized river craft produce significant numbers of injuries, especially from the propeller. Although active at the time, this suit against the Park's decision to eliminate motorized rafts would eventually be dismissed. Chapman continued by explaining to Moss that the NPS was trying to manage a total system and in the Canyon and their objective was to provide an experience different from the numerous motorized options available on other rivers. If people wanted a motorized experience, they had available many options elsewhere.

Moss appeared to gain the upper hand in the argument when he discovered that Park

action was based only on unscientific observations and that no formal studies had been undertaken to justify the elimination of motors or a reduction of use. Citing this administrative deficiency, Moss proposed that both motors and user days be maintained at current use levels until sufficient scientific studies were completed sometime in the future.[19]

Due to the controversy it had generated with the Utah delegation, by the time the Committee Report for S 1296 was filed on September 21, 1973, the wilderness provision of Goldwater's bill had been completely dropped. At least in part due to this controversy and in part due to the still pending Western lawsuit, implementation of the CRMP became sufficiently delayed that on October 31, 1973 NPS Regional Director Howard Chapman announced deferment of the decision to eliminate motors. Current use and allocations would be maintained until newly commissioned studies on the impact of motor use levels were complete.

Restarting the Public Process Since the Grand Canyon Enlargement Act's Wilderness component had been dropped, a provision was added that called for the Secretary of the Interior to report within two years all areas suitable for preservation as Wilderness. [20] Once the Grand Canyon Enlargement Act finally became law in 1975, an exhaustive public input process commenced in an effort to determine the public's feelings regarding Wilderness status for the Canyon. A series of meetings were held in September and October of 1975[21].

In July of 1976, following the release of the Preliminary Wilderness Proposal (DES 76-28), an additional series of meetings were held in St. George, Utah and in Flagstaff, Grand Canyon, and Phoenix, Arizona. Comments were acquired from a total of 23 Federal agencies, 17 state agencies, 3 Indian tribes, 39 organizations, 24 companies, and 501 individuals.[22] The five-year series of meetings consistently showed public sentiment strongly favored Wilderness designation for the Canyon below the rim and for the river itself, including the elimination of motorized river travel[23].

The conclusion of the wilderness study process resulted in the February 1977 Final Wilderness Recommendation that was signed by the NPS Director and called for immediate Wilderness designation of over one million acres within the Canyon, including the river corridor. Instead of promptly forwarding this now fully approved Recommendation to then President Carter, the NPS Legislative Counsel effectively stalled its Congressional approval by recommending that it be held until completion of the Colorado River Management Plan (CRMP).[24] Instead of using the approved Final Wilderness Recommendation as the driving force for setting management policies for the river, its presentation to the President was instead postponed until the final outcome of the CRMP became known and compatible. As you will find, this critical two-year delay based on somewhat questionable reasoning at least partially contributed to altering the environment on the river for well over 20 years into the future.

The 1975 Enlargement Act also had a direct effect on the CRMP itself. Indexed off the Wilderness pre-planning meetings held in the Fall of 1975, six river management

workshops were held in March of 1976 in Phoenix, Los Angeles, San Francisco, Salt Lake City, and Denver, as well as at the Grand Canyon. Comments of 365 participants and over 100 organizations were acquired, including those of the Hualapai Tribe, the Sierra Club, Western River Guides, and independent river runners from across the country.[25] As a result, in January of 1978 the Draft Environmental Statement - Proposed Colorado River Management Plan was released for public consideration.

In February of the same year, six more public meetings were held in the same cities and in March an additional meeting was held in Washington D.C. In all, 2,716 comments were received with 1476 respondents, or 54% favoring the elimination of motorized trips.[26] It is notable that only four people expressed opposition to Wilderness designation for the river corridor.[27]

In July of 1979 the final Environmental Impact Statement (EIS) which provided for the phase out of motor powered trips over a five-year period was released. Some of the specific conclusions of the plan were that the transition to all oar powered trips would cause no significant increase in trip costs, that oar powered trips were recognized to be a better buy for consumers, that commercial guides would benefit from a longer commercial running season and increased guide to passenger ratios, and that there would be no significant impact on the local or regional economies.[28]

One of the primary features of the ensuing 1980 Colorado River Management Plan was to limit river use by the number of launches, rather than by user days as in the past. This approach was intended to minimize the on-river congestion and inter-group contact problems produced by the user day system and unlimited launches. The 497 commercial launches of 1979 were thus reduced to 443 launches while the 89,000 commercial user days of 1979 were increased to 115,500. Total commercial passengers would remain at approximately 11,500 per year. This action was intended to both reduce congestion and accommodate the longer duration oar-powered trips, while delivering an increased "economic base" to smaller concessionaires.[29]

Of particular interest was a statement by the Park that the 70% commercial/30% non-commercial user day allocation ratio presented in the 1980 plan was only an estimate and would need to be adjusted in the future. More specifically, the 1980 CRMP states: "The allocation ratio is, because of the above factors, a best estimate based on the experience and interpretation of the above data. This ratio will be reviewed and adjusted as more reliable information becomes available." [30] From this statement it is readily apparent that, at the time, the Park wanted to avoid situations like the present where some Americans are being required to wait 20 years while others freely access the River almost on demand.

The 1980 Colorado River Management Plan

Implementing the provisions of the final EIS was signed on December 20, 1979 by Park Superintendent Merle Stitt, NPS Western Regional Director Howard Chapman, and NPS Director William J. Whalen. This action commenced what should have been a five-

year process of slowly eliminating motorized raft trips from the Canyon by the end of December, 1984.

Dam & Motors Anyone? (1979)

In 1979 in an effort to expand their clout with Congress, Fred Burke and Gaylord Staveley, together, reincarnated the earlier CROA into what was now called PROA, the Professional River Outfitters Association, (not to be confused with the contemporary PRO, Professional River Outfitters, a private trip outfitting and equipment company, ed.) chaired by Staveley. PROA purported to present a unified voice for the river outfitters who had historically been factional on a variety of issues.

Second term Congressman Robert Lee "Bob" Stump (R-AZ) had taken up the cause of Grand Canyon dam building from the efforts of his predecessor Sam Steiger. Stump, a Phoenix area farmer wanted more water for valley farming. Stump introduced a bill in March 1979, which, if passed, would have eliminated the motors vs. oars question, and possibly that of Wilderness altogether. Stump's proposal, House Bill (96) H.R. 3034, was to license construction of Hualapai Dam (also known as Bridge Canyon Dam) and would have cut a third of the river miles under dispute by drowning them under a proposed reservoir. Steiger had unsuccessfully sponsored a similar effort during 1975 with his introduction of (94) H.R. 6745. Stump had futilely attempted to revive Steiger's project during his first term as (95) H.R. 6906, and would again during in his third term as (97) H.R. 3167. To this day Stump reportedly continues to support construction of Bridge Canyon dam.[31]

Despite his ongoing efforts to drown the Canyon, the outfitters turned to Stump after the July 1979 release of the final CRMP EIS. Paying no attention to nearly a decade of NPS gathered public input urging the elimination of motorized trips, Stump fully subscribed to the outfitters position. In October of 1979, Stump introduced a bill to prohibit the Park Service from reducing the number of commercialized motorized trip user days to less than 1978 levels (96 H.R. 5712 - Oct 25, 79). The bill was officially summarized as follows:

"Prohibits the United States Park Service, for any calendar year beginning after the date of enactment of this Act, from reducing the number of user days of commercial motorized water craft travel permitted on the Colorado River in the Grand Canyon National Park to less than the number of such days permitted during calendar year 1978."

Stump's bill was referred to the House Committee on Interior and Insular Affairs, then chaired by the late Mo Udall (D -AZ), where it never received a hearing and was allowed to die. No public review or discussion of the bill's provisions was ever held. Despite the fact that Stump's proposals for both motors and the dam had floundered in committee, the foundation was being laid for both the elimination of Wilderness management and the generation of the 20 year wait that non-commercial Canyon rafters now face.

Enter James Watt, the Mountain States Legal Foundation, and Beer (1980)

Burke, Staveley, and PROA were not content to limit their efforts to throw out the NPS Wilderness recommendations only to Stump's obscure and poorly received bill. Staveley and Burke soon turned to the Mountain States Legal Foundation (MSLF).

The MSLF was established by and has been continuously funded by Adolph Coors, the famous western beer magnate. At that time, the fledging organization's chief legal officer and President was James Watt, an outspoken fellow who would later become Secretary of the Interior under the yet to be elected Ronald Reagan. James Watt, a Wyoming native, joined the U.S. Chamber of Commerce in 1966 where he directed the natural resources section.[32] He began his federal career in 1969, appointed by President Nixon to the Interior Department as Deputy Assistant Secretary for Water and Power Resources. In 1972 he became Director of the Bureau of Outdoor Recreation. At that time he spoke of that job, "I am a manager by profession. I could be managing widgets. I happen just now to be managing recreation." [33] In 1975 Watt became vice chairman of the Federal Power Commission until he resigned in 1977 when the Democratic Carter administration made him a persona non-gratis. In July of 1977, Watt became President and Chief Legal Officer of the Mountain States Legal Foundation (MSLF).

On March 27, 1980, the MSLF, still headed by Watt, filed suit on behalf of Canyoneers, Arizona River Runners, Hatch River Expeditions, and other motorized outfitters against NPS Director William J. Whalen in an effort to halt the elimination of motorized raft trips (MSLF vs. Whalen, et al).[34] Assisting PROA, Staveley, Burke, and the Mountain States Legal Foundation was a lawyer by the name of Jon Kyl, who at that time worked for the Phoenix law firm Jennings, Strouss & Salmon.[35] Unknown to anyone at that time, Jon Kyl would be elected in 1986 to his first of four terms in the U.S. House of Representatives and, in 1994, would become the freshman and current Republican U.S. Senator from Arizona.

Park Politically Pressure Cooked 1980 - Industry Gross \$7 Million Private Wait 6 Years
Consistent with their expanded political efforts, PROA and the outfitters persistently complained to the Arizona Congressional delegation about the provisions of the 1980 plan. These political efforts first became publicly evident during an Interior Appropriations hearing in May of 1980. At that time Senator Dennis DeConcini (D-AZ) acknowledged that he had received "complaints" about the 1980 CRMP plan during a meeting between the Park Service and outfitters in his Washington office.

At the request of Senator DeConcini, the Park granted the outfitters a meeting on June 5, 1980 allowing them an opportunity to suggest adjustments to the 1980 river plan. The Park emphasized no direct discussion of the decision to phase out motors would be allowed. Without any doubt, the efforts of the PROA consortium were starting to get results.

Staveley, Burke, and their wives attended the meeting along with Park officials and representatives from the offices of Senators DeConcini and Goldwater, and

Congressmen Stump, Rhodes (R-AZ), and Rudd (R-AZ). The subject matter primarily focused around determining the number of passengers accommodated in 1979 (11,665) and then giving motorized companies additional passengers to offset potential profit losses from their conversion to rowing. This provided for an annual "economic increase" of 1400 additional passengers, a 12% increase to the motorized outfitters over 1979 levels. Since the new rowing trips were inherently longer, this would effectively deliver well over 15,000 new user days and annually millions of dollars of new revenues to the motor companies. At the same time non-motorized outfitters consequently would receive less market share and non-commercial users would continue to increase their wait. Staveley later, in a press release, would describe the meeting simply as "very solid and productive" and that it resolved the scheduling issues related to the phase out of motors.[36]

A summary of the meeting was sent by the NPS to all river concessionaires that did not attend the meeting and to others who would be affected by modifications to the 1980 plan. After receiving extensive responses from other outfitters and interested parties, Regional Director Howard Chapman reported to Gaylord Staveley in an August 13, 1980 letter that at least a third of the river concessionaires disagreed with the Staveley and Burke's proposed modifications to the 1980 plan. Chapman also informed Staveley that, according to the Department of Interior Solicitor's (administrative law) Office, any implementation of their suggestions without a full public review would violate the provisions of the National Environmental Policy Act. Effectively, Chapman, with the concurrence of Interior Secretary Cecil Andrus, was rejecting the provisions of the June 5th meeting and upheld continuation of the 1980 CRMP and its provision to eliminate motors.

Staveley, stung by the Regional Director's rebuke, wrote to Stump on August 19th stating that all the arguments provided by the "ecopeople" who disagreed with him were generated by the Park. He suggested that his "opponents" were being manipulated and "... they are just saying what they are told to say." He went on to claim "untrue and unreal" comments and "lies" were being delivered by his opponents. Staveley charged as false the argument that increasing concessionaire allocations would in any way diminish opportunities for private, non-commercial boating. He described the argument as: "The lie that private (non-concessionaire) use is threatened by giving concessionaires the 1979 passenger levels." [37] In a subsequent letter dated August 21, 1980 to NPS Western Regional Director Chapman, Staveley continued attacking the "fabrications" of those in the "ecobizness"(sic).

Just a Concerned Taxpayer

After PROA's embarrassing summer defeat, it became apparent that a new approach would be needed. Congressman Eldon Rudd (R-AZ) had already requested details on GCNP river expenditures from then Acting NPS Director Ira Hutchison. Rudd, in an August 29 letter to C. J. Ross, forwarded Hutchison's August 19, 1980 response and invited the outfitters to any input they deemed appropriate.[38] One person responding to Rudd's expenditure inquiries was Pamela Manning, then Executive Vice President for

Burke's Arizona River Runners business. Without disclosing her affiliation with ARR, Manning alleged that the GCNP had significantly increased their operational costs by hiring five permanent river staff and an extra patrol crew to accommodate the new management plan. She further alleged that the Park had incurred significant expense and "bureaucratic waste" in purchasing a trailer to accommodate the non-commercial permittees. Manning went on to state that one motorized patrol crew could perform as much work as two oar crews, and inferred that oar trips were popular with Park personnel simply because they had to do less work.[39] Manning concluded by stating that she was concerned about the waste of tax dollars, and that did not wish her name to be attached to the letter's contents since she was known in the river community.

Rudd responded to Manning with a letter stating he was confident that Bob Stump's previously ignored proposed legislation would be reintroduced to combat "the unfair CRMP" and thereby protect the rights of river runners.[40] That same day Rudd sent another letter to Hutchison paraphrasing Manning's allegations of misuse of funds and demanded a detailed budget for the GCNP River Management Unit. Hutchison compiled the requested information and, in his November 28, 1980 response, explained to Rudd that the trailer under dispute was surplus property given to the GCNP by Glen Canyon National Recreation Area, and that permanent GCNP river personnel had increased not by the alleged five, but only by a single person since 1973.[41] Although the information previously provided to the Congressman by Manning was proven to be incorrect, by the end of November it really didn't matter; something else had already happened that would change the whole river horizon for decades to come.

The Hatch (River Expeditions) Amendment

In 1980 first term Senator Orrin Hatch (R-Utah) was in his fourth year in office. Orrin is the great grandson of Jeremiah Hatch, the founder of Vernal, Utah. Orrin's father, Jesse, was cousin to Bus Hatch, the founder of Hatch River Expeditions, who was also a grandson of Jeremiah. Bus' son Ted Hatch, like Orrin, was a great grandson of Jeremiah. Ted was then, and currently still is the owner of Hatch River Expeditions, the oldest and, at that time, the largest motorized raft company in the Grand Canyon. Hatch maintains a warehouse in Marble Canyon where ARR was located at the time.

Fred and Carol Burke along with Pam Manning telegraphed Senator Hatch on November 4, 1980 stating that motor elimination would deliver a negative economic impact on Southern Utah and Northern Arizona. They also stated, "We urgently support your amendment to the Appropriation bill." [42] By this communication, it was now evident that the outfitters were very aware that Hatch was preparing to introduce legislation in their behalf.

On Nov. 14, 1980, Sen. Orrin Hatch hastily introduced from the Senate floor Amendment SU175 to the 1981 Interior Appropriations Bill (96 H.R. 7724). This Interior Appropriations Bill provided the crucial annual funding necessary to maintain the operations of the Department of the Interior for the fiscal year ending September 30,

1981. It was common knowledge to the Senate that any appropriations amendment would be effective only for the single year the bill provided funds to run the Department of Interior.

SU175, which would later become known as the "Hatch Amendment," was first considered by the Senate on the Friday just prior to its Tuesday, November 17th final approval. Neither the amendment nor its content ever received public review, even in the form of a committee hearing. The Amendment was cosponsored by Senator Barry Goldwater (R-AZ) and Jake Garn (R-UT)[43] and consisted of the following words:

(a) None of the funds appropriated in this Act shall be used for the implementation of any management plan for the Colorado River within the Grand Canyon National Park which reduces the number of user days or passenger-launches for commercial motorized watercraft excursions, for the preferred use period, from all current launch points below that which was available for the same period of use in the calendar year 1978.

(b) For the purposes of this section "preferred use period" denotes the period May 1, through Sept. 30, inclusive.

Hatch's and others' presentations in support of the Amendment, spanning four pages of the Congressional Record, was in no way subtle. Throughout the testimony process, Hatch made no public mention of his familial relationship to the companies his action would ultimately benefit. Hatch commenced by echoing the same safety and access issues that his predecessor, Frank Moss, had voiced 8 years earlier. He indisputably demonized the Park Service for even offering the CRMP, stating that they were "jeopardizing the availability" of the Canyon. He extolled the virtues of motorized rafts as the most cost-effective way to get the greatest numbers of people into the Canyon. He continued by stating that the Park Service was inflicting its non-motorized oar provisions on an "unwilling and often unknowing public without regards to cost. And, I might add under more dangerous circumstances.[44]"

Hatch's cost arguments were flawed, completely ignoring the fact that non-commercials were dramatically less expensive than any commercial trip, motorized or not. He never mentioned to the Senate that the CRMP he opposed was part of a 10 year NEPA compliant public decision process. He never acknowledged that continuation of motorized rafts would enhance public demand for a resource already outstripped in its ability to handle it. Hatch never acknowledged that his amendment would provide his relatives and the motorized outfitters dramatically increased profits.

An Ambivalent Passage

Some Senators expressed concern that the amendment was inappropriate for this appropriations bill and that no hearings were ever held on this specific matter. In particular, Senator Huddleston moved that the Hatch Amendment should not be allowed since it should have been more fully considered in the appropriate committee[45]. In

effect Huddleston recognized that the Senate was unable to vote on this subject from a position of knowledge.

Retrospectively, Hatch was probably aware that if he forthrightly introduced a bill opposing NPS actions, it would spur debate and the subsequent analysis would expose the extensive history behind the NPS actions. Such an effort to defeat the issue on its merits would be certain to fail, as had Stump's earlier attempt. Cleverly, Hatch opted for the much easier alternate and apparently successful approach of legislatively defunding his NPS opponents.

Since it was attached to a one year appropriations bill, it was obvious to the Senate that the provisions of the Hatch Amendment were not permanent and could only affect management policy for one year. Rather than waste precious time in this late stage of the legislative session and after senators on the Energy and Natural Resources Committee promised hearings on the issue during the following year, the Senate accepted the amendment on a voice vote.

As a result SU 1754 was quietly absorbed into the appropriations bill which eventually evolved into public law 96-514.

Reveling in his apparent success, Burke wrote to Lisa Jackson of Rep. Stump's office with his recommendations for implementation of the Hatch Amendment. In a November 29th letter, Burke recommended an increase in launches so that the motorized outfitters could be able to accommodate the 150 people per day maximum historical use provided for in the Amendment. In his letter, Burke additionally asked for Congressional hearings early in 1981 so that as soon as possible a determination could be made as to the scheduling of motor trips and whether motors would be allowed during the 1982 season. [46] Burke's correspondence shows that both he and the outfitters were aware that Hatch's Amendment, as passed, was only temporary and that the phase out of motors might begin anew the following season.

Introducing - Secretary of the Interior James Watt (Watt's Senate Confirmation Hearings)

Staveley, Burke, and the other motorized outfitters were probably delighted by the good fortune that had befallen them as a result of the November 1980 election of Ronald Reagan as President. When Senator Clifford Hansen (R - WY) declined Reagan's offer of Secretary of Interior, on December 22nd, 1980 the position was then offered to the same James Watt, President of the Mountain States Legal Foundation, who was already helping the motorized outfitters by suing the Park to retain motorized rafts.[47] As virtually everyone in the country would soon know, Watt, who had already described environmentalists as "the greatest threat to the ecology of the West,"[48] accepted the position as Secretary of Interior, the trustee of America's public lands.

Reagan's election to the presidency became official on January 6, 1981 when a joint session of Congress counted the votes of the Electoral College.[49] The following day Watt's confirmation hearing in the Committee on Senate Energy and Natural Resources began. The Committee was particularly interested in Watt's potential for conflict of interest since, as President of the MSLF, he had sponsored numerous suits against the

Department of Interior. The committee's interest was justified. During questioning about the MSLF, Watt made the surprising claim that he didn't even know who the contributors to the MSLF were. Senator John Seiberling (D-Ohio), Chairman of the Interior Subcommittee on Public Lands informed Watt with the specifics of who the financial supporters of the MSLF were and then concluded with the following observation. "These are people whose primary interest in public lands is to exploit them for their own profit. Their idea of multiple land use is to have everything with any conceivable value developed, even if its primary value is Wilderness." [50]

Watt had been asked to submit to the committee a summary of those MSLF cases that involved the agency. Watt's prepared summary incorrectly cited his Arizona suit to retain motorized rafts in the Canyon. Instead of describing the MSLF v. Whalen case as filed, the description supplied to the committee was "MSLF v. Dickenson," the NPS Director that succeeded Whalen. In Watt's statement, the suit was summarized as follows: "MSLF seeks to protect the right of the public to reasonable, environmentally sound access to the Grand Canyon for recreation by challenging the Park Service's decision to ban all motorized raft trips on the Colorado River through the Grand Canyon." [51]

During the hearing segment questioning Watt's involvement with motorized rafting, Senator Dale Bumpers (D-AR) explicitly stated that the Senate (against his [Bumpers] own vigorous protest) had adopted only a one-year postponement of the Park Service river management plan. [52] Bumpers even directly asked Watt, "Do you favor the Wilderness Act." Watt's response: "Absolutely."

Before the hearings had begun, Watt had generated a recusal statement wherein he consented only to refrain from assisting the MSLF in any further prosecution of the Interior cases. Watt submitted his statement to the Committee after having already discussed its content with the chairman of the Committee, Senator James McClure (R. Idaho).

Curiously absent from Watt's commitment was any promise to, as Secretary of the Interior, refrain from involving himself in the issues surrounding the MSLF's Interior Department litigations. The statement successfully made it through the hearing without any mention of this deficiency. Time would prove that Watt would utilize this oversight to MSLF's fullest advantage.

More Concessions, Motors, and the Brave New World of Watt

Once Watt was confirmed and sworn in there soon became little doubt that he had an agenda and that he would do whatever it took to get it through. A main feature of the Watt plan for the parks was a significantly larger role for the concessionaires, displaying an almost zealous drive to involve them in park operations wherever possible. In a March 9, 1981 appearance before the Conference of National Park Concessionaires, Watt pledged, "It is time for a new beginning and the private enterprise system must be looked to for rejuvenation and enthusiasm as we try to make the parks more accessible and usable for the people.... You folks (the concessionaires) are going to play a

tremendously important role and a growing role in the administration of our National Parks and we are going to reach out and involve you in some areas that you haven't been asked to be involved in before.”[53]

So zealous was Watt's desire to facilitate concessionaire involvement, he expressed a ready willingness to remove anyone who might be in his path. “If we need to change personnel under Russ (Dickenson – NPS Director) to accomplish a more aggressive concessionaires program, we will change the people.”[54] Watt continued, “If a personality is giving you (the concessionaires) a problem, we are going to get rid of the problem or the personality, whichever is faster.”[55]

Besides his overt enthusiasm for more privatization of the parks, Watt felt no need to withhold his opinion supporting motorized rafting in the Canyon. “I don't like to paddle and I don't like to walk.” James Watt would say, almost with a touch of pride.[56] Watt himself saw little value for extended river trips. Relating about his own Grand Canyon motorized raft trip, “The first day was spectacular.... The second day started to get a little tedious, but the third day I wanted bigger motors to move that raft out. There is no way you could get me on an oar-powered raft on that river – I'll guarantee you that. On the fourth day we were praying for helicopters and they came.”[57]

The country now had a Secretary of Interior that thought the motor trips were too long and the motorized Wilderness was still much too tedious.

On the Monday following Watt's confirmation hearing, January 12, 1981, a press release came from NPS Western Regional Director Howard Chapman announcing “... the public will have the option of motor or oar trips in the future.” Chapman also disclosed that he would be using the Hatch Amendment as a guide to future river management.

The next day, GCNP Superintendent Dick Marks both called and wrote Fred Burke with the good news that the commercial “preferred use season” allocation would be for 105,500 user days. Use would be based upon user days, rather for the “total number of people” method provided in the 1979 plan.[58] This single provision emphasizing user days handed to the outfitters the economic motivation to supply the public with the shorter motorized trips that deliver the most profit, rather than to provide the longer oar powered trips which cost patrons less per day. This same increased frequency of short trips set the stage for the current use of helicopters, which now service more than 50% of the commercial river passengers.

On February 10, 1981, the MSLF wrote to Fred Burke advising him that the MSLF would be putting their suit on inactive status as they waited for the Park, now officially under the supervision of their former leader, to take the “appropriate action” to fulfill their new promises[59]

1981 Draft Alternatives – Motors, Motors, or Motors?

Other than Watt's intermittent comments in support of motorized rafts, little was conveyed to the public about the status of the river until that summer. On June 8, 1981 ignoring ten years of public input calling for the elimination of motors, a new set of fully motorized management alternatives emerged for public comment with release of "Draft Alternatives for the Colorado River Management Plan." This completely new set of four separate motor-oar combination alternatives, each of which provided for continuation of motor use throughout the summer season, was announced by NPS Western Regional Director Howard Chapman who now claimed that the 1979 plan had been "vetoed by Congress." [60] These new alternatives did not allow the historical public preference for the elimination of motors to even be considered.

This draft document stated that the new set of presented alternatives were needed because "The (Hatch) Amendment prohibited a reduction of user days or passenger launches for commercial motorized craft below 1978 levels during the summer season. The commercial use level in 1978 was 89,000 user days." [61] The press release accompanying the draft plan further echoed Chapman's erroneous conclusion that "... the plan adopted by the Park Service in 1979 was subsequently vetoed by Congress last year." [62] A two-month public comment period was provided and closed on August 12, 1981.

With the release of this new plan the Senate's vote for a single year postponement of the implementation of the 1980 CRMP had somehow been transformed into a full purge of the motor phase-out concept. Also, conveniently forgotten were the Senate hearings that were promised to have occurred in early 1981 that would have more thoroughly examined the facts Orrin Hatch abruptly introduced on the Senate floor on November 14, 1980. Completely forgotten was the Park's plan to revise the user day allocations. Using the same misinterpretation of Congressional directives, the 1980 plan's temporary 70% commercial user day ratio spontaneously, in the 1981 Plan, became inflexible at 115,500 user days for the commercials and 54,450 for the privates. [63] The die was now being cast for the twenty-year wait currently confronting those Americans who choose to access the Canyon non-commercially.

Quite happy with the completely motorized horizon the 1981 draft provided, Watt's Mountain States Legal Foundation abandoned their lawsuit on July 16, 1981.

1981 CRMP – The Incredible End to the Decade of Public Input

In December of 1981 came the issuance of the final 1981 CRMP that provided continuation of motors and the foundation upon which the river is managed today. This 1981 document also repeated and further codified the earlier draft version's dubious interpretation of the Hatch Amendment with the statement, "The amendment prohibited a reduction of user days or passenger launches for commercial motorized craft below 1978 levels during the summer season." Without ever mentioning that the only alternatives presented for public comment in the June of 1981 Draft were combinations of motor and oar use, the plan justifies its final conclusion with the statement, "The

preponderance of these (public) comments favored some combination of oars and motors, while voicing interest to have a period of oar only use."[64]

This 1981 CRMP contained no mention of any consideration of the non-motorized options consistently requested and preferred by the public. The preceding 1980 CRMP had been developed through processes that complied with the National Environmental Policy Act. Such NEPA processes, which require that "all reasonable alternatives be considered," form legal, binding decisions that require implementation by the administering agency. A decision arrived at via the NEPA process cannot be withdrawn or a new decision made without going through a similar NEPA compliant process. Clearly, the publicly preferred no motor option was a "reasonable" alternative that was never considered in the 1981 plan. The failure to include those "no motor" options in the development of the 1981 plan would seem to be in violation of the NEPA process. The temporary defunding of a project had been magically transformed into an illegal "veto" of a decade of public input.

Of particular note is the 1981 CRMP document that was signed by Superintendent Richard "Dick" Marks on 11/25/81, Western Regional Director Howard Chapman on 12/8/1981, and by NPS Director Russell Dickenson on 12/13/1981. Significantly, at the time of each of their 1981 CRMP authorization signatures, the federal government had already entered into the 1982 fiscal year. Since the provisions of both public law 96-514 and its Hatch Amendment had already expired with the September 30th end of the 1981 fiscal year (94 Stat. 2957), the very basis for the provisions of the 1981 plan no longer existed.

At that time of its signing there weren't any grounds for deviation from the elimination of motors provided in the publicly reviewed 1979 Final EIS and 1980 CRMP. That fact was apparently forgotten despite numerous references on the Senate floor and during Watt's Confirmation hearing that the Hatch Amendment was "solely a one year postponement of the 1979 decision." [65] As stated earlier, even the outfitters had recognized that the Amendment provided only for a single year postponement and "that motors may not be allowed in 1982." [66] Somehow, all this was forgotten by the National Park Service while it was under the supervision of James Watt.

1999 Have Your Cake And Eat It Too (Commercial Outfitters Gross over \$27,000,000 - Privates Wait 20+Years)

The 1981 plan provided for 1979 commercial use levels of 89,000 user days to be increased by 26,500, a 30% increase. This increase resulted in the current total commercial allocation of 115,000 user days, none of which includes the 30,000 user days allocated to crew members that accompany the commercial passengers. This commercial user day level was originally provided in the 1980 plan as an "economic base" to effectively compensate the outfitters for reduced total revenues created by conversion to the longer oar powered trips. Now, under the 1981 CRMP, the motorized outfitters were able to keep their motors while still being compensated as if they had

converted to oars. For Ted Hatch of Hatch River Expeditions alone, the increased user days indirectly provided for by his distant cousin's Amendment translated to almost 1,000 more user days per year, or 17,000 more user days over the last seventeen years.[67] Since Orrin Hatch had failed to disclose his family's benefit from the outcome of his amendment, the Senate could not have been aware that they would be providing the Hatch family with more than \$4,250,000[68] in cumulative gross revenues over the next 17 years. In fact the "economic increase" by itself delivered the group of motorized outfitters additional gross revenues of \$78,800,000 between 1981 and 1998 once the 1980 CRMP was aborted.[69]

No matter how you look at it, the monetary returns from Staveley and Burke's one-year effort were excellent. The motorized raft industry in the Canyon is now approximately a \$20 million dollar a year industry. Staveley's Canyoneers business alone now grosses more than \$1,000,000 per year. Arizona River Runners, no longer owned by Burke, similarly grossed over \$3 million in 1998. Today motors prevail in America's foremost river Wilderness while non-commercial river runners are now waiting 20 years for access.

All this, while the river flows and the outfitters continue to insist, everything is fine; don't change it.

[67] As of 1979 Hatch River Expeditions had been allocated 10,080 user days/year. In 1989, after final assignment of all summer and winter dates, the Hatch allocation had

increased to 11,027 user days/year. Source: Colorado River Management Plan, 1989, Grand Canyon National Park, page C-14.

[68] In 1998 dollars, based upon the consideration that trip per day fares/value are the same from year to year, valued at the 1998 average per day fare of \$250.

[69] In 1998 dollars. Motor operators comprise 70% of commercial river running activities. They received 70% of the additional annual award of 26,500 more commercial user days granted in 1981 to concessionaires. That is a total of nearly 315,000 user days made available for motor trips since 1981.

River News 05/01/02

Mission and Goals of River Runners for Wilderness

Principals: Jo Johnson, Tom Martin

An organization for all river runners dedicated to the Wilderness Colorado River and its tributaries.

Guiding principles:

Champion Wilderness designation and protection for all suitable reaches of the Colorado River watershed, including the backcountry and Colorado River in Grand Canyon National Park.

Encourage allocation free management plans for all suitable reaches of the Colorado River watershed, including the Colorado River in Grand Canyon National Park.

Protect the WILDERNESS resources of the Colorado River Watershed.

Mission statement:

Promote the highest resource protection values through Wilderness management and stewardship activities on the Colorado River watershed.

Safeguard non-allocated access to the Colorado River watershed for all recreational river runners.

Goals:

Establish and safeguard a non-motorized Wilderness river corridor for the Colorado River through Grand Canyon National Park, including congressional wilderness designation for the backcountry and river in Grand Canyon National Park.

Establish and oversee a transparently fair state of the art access model that is not based on allocated set asides for any one user group on the Colorado River in Grand Canyon National Park.

Promote the highest resource protection values through stewardship activities on the Colorado River through Grand Canyon National Park, including service projects such as education of river runners, partnership with GCNP on data gathering and resource protection activities.

Letter to LR 05/01/02

Congressional Friends of Lake Powell

Dear Friend:

If you love Lake Powell, we need your help to protect it!

It may not be too apparent at first, but, ***Lake Powell is under assault by radical environmentalists***. They have engaged in a slow, deliberate effort to convince the public over time that Lake Powell must go and that we must "restore" Glen Canyon to its primitive state (even though that is impossible). Just ask anyone in the Phoenix media market if they've seen or heard the ads being aired right now by the Sierra Club that talk about restoring Glen Canyon. The ads don't say "Drain Lake Powell," but that is what they're advocating.

And while these extremist groups are subtle and try to stay under the radar of Lake Powell supporters, over the last few months, they have redoubled their efforts and raised nearly a million dollars, dedicated to one thing -- draining Lake Powell.

Here's a little history on the movement:

In November of 1996 the Board of Directors for **the Sierra Club** **voted unanimously to "drain the reservoir behind Glen Canyon Dam."** They didn't vote to study whether Lake Powell should be drained; they didn't vote to engage in conversations about decommissioning the dam; **they voted to drain Lake Powell -- end of discussion.**

Following that vote two organizations were formed: The Glen Canyon Institute and the Glen Canyon Action Network (now known as Living Rivers). These two organizations have one common goal -- to drain Lake Powell.

We wish we could say that advocates of draining the lake are just far-out fringe organizations with marginal support, but the truth is that their efforts are funded to the tune of almost a million dollars Per year and they have large staffs working every single day toward the single purpose of draining Lake Powell.

You may be thinking: "Well, they may have all this money and organization, and may blow a lot of hot air, but Lake Powell will never really be drained."

We must make one thing perfectly clear: ***If there were a vote on the floor of the U.S. House of Representatives tomorrow that called for the decommissioning of Glen Canyon Dam and the draining of Lake Powell, there is a chance that we would lose that vote!***

Environmental groups work to sway public opinion with emotional pleas and campaigns of misinformation. For example, the Executive Director of Living Rivers in a recent *Arizona Republic* opinion piece claimed that the Grand Canyon river corridor is now rapidly once lush and that it was now rapidly "becoming sterile".

And the President of the Glen Canyon Institute recently argued that because of Glen Canyon Dam:

Wildlife, plant life and whole communities are dying big dams, for all their water storage capability, are bad and whatever benefits they give to the world are immensely overshadowed by the destruction that they cause.

Species are endangered from the headwaters all the way to the Delta because of Glen Canyon Dam, (which) is silting in at an alarming rate and after only 40 years of life, the San Juan arm of Lake Powell is completely sedimented in.

Is the San Juan arm silted in? Of course not, it has over 50 miles of navigable water!

Was the Grand Canyon corridor once lush and only recently turned sterile? Not according to Helen Yard, a consulting ornithologist for the Grand Canyon Monitoring and Research Center:

The Colorado River corridor was a scour zone before the dam went in. There was little, if any, nutrient-rich sand on which trees could grow. There is probably a higher abundance of birds here now than there was before the dam because [now] there are trees. The newly created habitat might be a boon for bird populations that are crashing elsewhere. Riparian systems are declining in the Southwest. Perhaps this is somewhat of a refuge."

The truth is that Lake Powell provides over 40% of the water storage on the Colorado River - water storage that serves millions of Americans who depend on the Colorado for electricity generation, protection from drought, livelihood of communities and for recreation.

But when powerful "green" groups put out misinformation, the public and elected officials from the East and Midwest believe it, largely because those who understand the issues and the value of Lake Powell are not financially able to counter the lies being told.

While the numbers and dollars of groups who want to drain Lake Powell continue to rise, there is only one organization that is working every day to protect Lake Powell. It has one full-time staff member and a current budget of less than \$70,000 per year. It is the **Friends of Lake Powell, Inc.**

All of us who are Friends of Lake Powell recognize the huge educational task we face to protect the Lake, and we need your help to counter such outrageous claims before public opinion and political leaders are turned against Lake Powell.

Certainly you see the problem. *How likely are we to effectively protect and defend the lake that w, love with one person fighting these large and well-funded organizations?* The odds aren't good. At some point, unless we significantly strengthen our defense, those of us who love Lake Powell will get rolled. It may not happen this year or next, but if there is a lesson to be learned from other aggressive environmental efforts (like banning snowmobiles in Yellowstone), the lesson is that extreme changes in policy can be adopted and implemented so quickly that you don't have time to mount a defense.

Won't you become a Friend of Lake Powell, and encourage your friends and neighbors to add their names, dollars and collective strength to this important cause?

We must step up and do our part! Ask yourself where you could go to replace the Lake Powell experience..? Ask yourself what it is worth to protect a place so unique in all the world..?

Please fill out the enclosed card and send a tax-deductible contribution today! Your gift of \$1,000, \$500, \$ 100 or even \$35 will help the Friends of Lake Powell to mount a vigorous defense for our beautiful desert jewel.

We cannot emphasize enough, how important it is for you to get involved in protecting Lake Powell. Please act today, and help us preserve the many benefits of Lake Powell -- the water supply, power supply, recreation and wildlife habitat -- so that our children and grandchildren can enjoy Lake Powell in the future.

Thank you very much for supporting this important effort.

Sincerely,

Jim Hansen, U.S. Congressman, Utah's 1st District; John Shadegg, U.S. Congressman, Arizona's 4th District; Chris Cannon, U.S. Congressman, Utah's 3rd District; Jim Gibbons, U.S. Congressman, Nevada's 2nd District.

P.S. Your tax-deductible contribution of \$1,000, \$500, \$100 or even \$35 is critical to our continued efforts to protect Lake Powell. Please send a contribution today! Thanks!

Simulated Floods: No Help for the Grand Canyon

Vol. 2, No. 4, May 2002

The Bureau of Reclamation (BuRec) is working on another public relations charade to combat mounting pressure that it is not doing enough to stop the decline of the Grand Canyon ecosystem caused by Glen Canyon Dam. As a result they are contemplating a two-year series of experimental flows from Glen Canyon Dam to improve habitat conditions for humpback chub, an endangered native fish. But like similar exercises conducted over the past five years, these too are doomed to fail.

According to Dave Haskell, retired science director for Grand Canyon National Park, "The three key things this ecosystem needs are warmer water, sediment, and annual high flows to distribute sediment into the system. These experiments will not provide this."

Ninety to ninety-five percent of the sediment Grand Canyon needs remains trapped behind Glen Canyon Dam. Lack of sediment and driftwood has eliminated beaches and changed the carbon base, which in turn has caused the near disappearance of the Canyon's natural food web. The historic food source for native fish has vanished; no insects native to the Canyon remain and riparian vegetation is struggling in the sterile soil.

At best these experimental flows will move a tiny fraction of the Canyon's remaining sediment. Moreover, since these flows are not designed to exceed 45,000 cubic feet per second, when pre-dam flows were routinely twice this, the overall benefit to native fish and plants will be further compromised.

Manipulating the dam won't change the chilly water temperatures either. Water released from Glen Canyon Dam is a constant 46° F., causing the river temperature to seldom exceed 55° F. Native fish require warmer water with temperatures reaching 80° F., the natural pre-dam summer temperature of the water.

In 1996 BuRec received a huge public relations boost for implementing simulated flood flows from the dam, but the native habitat gained nothing. "Here we are five years and

\$40 million later, ready to repeat history," says John Weisheit, LIVING RIVERS' Conservation Director. "That's why we are building a new Grand Canyon Restoration Coalition to mobilize widespread support for true restoration of the Grand Canyon."

Living Rivers Currents 05/10/02

Sediment-al Journey, Roadshow for the Grand Canyon

Vol. 2, No 4, May 2002 (Drainit Times No. 2)

Moving the Bureau of Reclamation (BuRec) to move sediment is the focus of LIVING RIVERS' upcoming "Sediment-al Journey." June 17, 2002 is the 100th anniversary of BuRec's founding, marking a century of river devastation. The victimization of the Colorado River through the Grand Canyon is a case study of the Bureau's exploits.

Caught between BuRec's two largest concrete dams, Hoover and Glen Canyon, the Grand Canyon is slowly becoming sterile. Glen Canyon Dam disrupts the food chain because it traps the nutrient-laden sediment. The dam also causes drastic water temperature changes, and tames the formerly life-giving seasonal flood flows. Five of eight Grand Canyon native fish species are either gone or on the verge of collapse, beaches are disappearing, and damaging exotics are choking out native vegetation. Public officials and others who have profited at the expense of the river will celebrate BuRec's anniversary at Hoover Dam. LIVING RIVERS and the Grand Canyon Restoration Coalition will be there too, but with a different message. The Sediment-al Journey, which will conclude its five-day road trip at Hoover Dam on June 17, will draw public attention to the extensive environmental damage that is BuRec's 600-dam legacy.

Our journey will begin with an evening rally and banquet on the banks of the Colorado near Canyonlands National Park. People will be bringing sediment from throughout the basin to load into a dump truck for transport to the Grand Canyon. Participants will then head to Antelope Point, on the edge of Lake Powell, to collect more sediment and to support Navajo activists in their opposition to a proposed marina (see back page). Then it's off to Glen Canyon Dam and the first ceremonial sediment dump below the dam. We'll then spend two nights along the river at Lee's Ferry, passing out sediment to those embarking on their Grand Canyon river trips, as well as taking a day-long trip ourselves from Glen Canyon Dam back to Lee's Ferry.

On the eve of arriving at Hoover Dam we will gather at Grand Canyon National Park to rally and inform visitors of the Park's dying ecosystem at the hands of BuRec. Riverside music, cookouts and camping will round out the festivities as we promote the need for BuRec to transform its mission from one of devastation to restoration. Please join us.

LIVING RIVERS

Sediment-al Journey

Sediment Problems: the Beginning of the End for Lake Powell

Vol. 2, No 4, May 2002 (Drainit Times No. 2)

In late March LIVING RIVERS completed a reconnaissance of the upper Colorado River arm at Lake Powell reservoir to further ascertain the gravity of the sediment build-up and delta formation at the head of the reservoir. With the reservoir at its lowest level in

nine years, we were provided with a vivid picture of nature's progress toward forcing the decommissioning of the reservoir marinas, and ultimately Glen Canyon Dam.

As anticipated, there was extensive sediment accumulation in both the main stem and side canyons. In many places the Colorado is cutting channels 25-foot deep, with perched segments calving off like glacier slabs along the Alaska coastline. River travel is difficult, as a minefield of sandbars and mudflats significantly complicate navigation through much of the main channel as it enters the reservoir.

An examination of the Dirty Devil River, one of the major tributaries flowing into the reservoir, revealed a ticking time bomb. Its river channel is completely full of stored sediment, a situation we observed in many of the side canyons. This suggests that a significant amount of sediment will be dumped beyond the suspended pile and into Hite Bay when strong summer storms resume on the Colorado Plateau.

There was also evidence of the river remobilizing sediment for transport toward the dam. With the reservoir level down 54 feet, the Colorado River has regained 30 miles of current, which is churning up and reworking the sediment down-reservoir. Because of new operating guidelines to store more Colorado River water in California, and cumulative poor snow packs in the headwaters, it will be difficult to keep Lake Powell reservoir full. The low reservoir levels will restore a flowing river over sediment, which will mobilize and quickly advance the delta and associated turbidity flows towards Glen Canyon Dam. Turbidity flows are the suspended sediments that continue flowing along the bottom of the reservoir and pile up before the front of the dam.

Currently the main delta sits about 150 miles from the dam, and less than one mile from Hite Marina. The delta's advancement will soon force the closure of this marina, possibly as early as the end of this year. The sediment accumulation and reduced marina access will create problems for private and commercial river runners who end their Colorado River Cataract Canyon trips at Hite Marina. A similar situation already exists for river runners on the San Juan River arm of the reservoir. The San Juan delta is growing nearly as fast as the Colorado's, and has only about 100 miles to travel before reaching Glen Canyon Dam.

According to Dr. John Dohrenwend, a geomorphologist formerly with the US Geological Survey who took part in the expedition, reservoir and dam managers may be in for a shock. Similar to how BuRec planners misjudged the amount of water in the Colorado watershed, giving away 22% more water on paper than the river actually delivers, they may have misjudged the sedimentation rates too. Researchers have documented incredible cycles of erosion followed by deposition in the arroyos and rivers of the Colorado Plateau. In the 1880s, for example, a cycle of arroyo cutting and sediment movement began in the Southwest; this cycle ended in the early 1940s. Since then, there has been less erosion and more valley bottom deposition. "Thus," says Dohrenwend, "sedimentation in Lake Powell, from its creation to the present, occurred during a time of relatively slow landscape change that is not fully representative of historic times. Indeed, a return to the conditions that prevailed during the first half of the

twentieth century would significantly accelerate sedimentation in Lake Powell and would significantly affect future use and operation of this reservoir."

Living Rivers Currents 05/10/02

Lake Powell Pipeline: Opposition Builds on Anti-Dam Day

Vol. 2, No. 4, May 2002 (Drainit Times No. 2)

Water conservation and river restoration were the rallying cries outside Utah governor Mike Leavitt's office on the fifth International Day of Action Against Dams and for Rivers, Water and Life, March 14, 2002. LIVING RIVERS was joined by eleven other Utah river advocacy organizations in presenting the first annual "State of Utah's Rivers Report" which highlighted the rapidly declining health of the Green, San Juan and Colorado rivers, as a result of excessive water consumption.

Of major concern is a proposed pipeline from Lake Powell reservoir to St. George in Utah's Washington County. The proposed \$250-million project is designed to bring 70,000 acre-feet of water to southwest Utah, which is 150 percent more than the region is presently using. Washington County now wastes more water than practically any other community in the country; its per capita water use is 355 gallons per day. In contrast, the community of Tucson uses only half this amount of water: 170 gallons per person, per day.

If constructed, this pipeline would also represent the first major water diversion directly from Lake Powell reservoir. LIVING RIVERS is opposing any such infrastructure as it would be unnecessary and add to the costs associated with the eventual decommissioning of Glen Canyon Dam.

Water conservation and river restoration were the rallying cries outside Utah governor Mike Leavitt's office on the fifth International Day of Action Against Dams and for Rivers, Water and Life, March 14, 2002. Dam Risks Interior Denies Public Right to Know

Vol. 2, No. 4, (Drainit Times No. 2)

LIVING RIVERS' efforts to obtain information on the communities impacted, should Glen Canyon and Hoover dams fail, are headed for the courts. On April 2, the Department of Interior denied LIVING RIVERS' appeal of the BuRec's November 2001 decision to deny its Freedom of Information Act request for dam failure inundation maps.

At issue is BuRec's claim that this information should be withheld because it pertains solely to the internal operations of the agency. LIVING RIVERS contends that the tremendous risks associated with the failure of one or both of these dams should be made known to the public. BuRec documents obtained through other sources reveal that if Glen Canyon Dam failed, a 500-foot wall of water will scour much of the Grand Canyon. This will cause tremendous ecological damage, loss of sacred sites, and the certain death of any recreationists unable to escape to higher ground.

But of potentially greater concern are the impacts this torrent will have when it reaches Hoover Dam. It is estimated that a 75-foot wall of water will overtop Hoover Dam, posing significant threat to dams downstream, riverside communities such as Laughlin, Nevada and Blythe, California, as well as several Indian nations. Such a flood could also threaten the water supplies of tens of millions of people. If Hoover Dam failed in the process, the catastrophe would be monumental. BuRec, however, is withholding this information and keeping those who might be affected, in either scenario, in the dark.

In 1997, the US Court of Appeals forced the Department of Agriculture to release maps pertaining to spotted owl habitat to the Maricopa Audubon Society. At that time, the Federal government was asserting that such maps were germane solely to the internal operations of the agency and thus not releasable to the public. LIVING RIVERS hopes that the courts will find that inundation maps belong in the public domain too.

Antelope Point: LR Coalition Fights New Marina

Vol. 2, No. 4, May 2002 (Drainit Times No. 2)

LIVING RIVERS was recently joined by 17 other organizations in demanding suspension of the planning process for the proposed Antelope Point Marina project on Lake Powell reservoir. In an eleven-page letter sent April 14 to Glen Canyon National Recreation Area officials, the coalition expressed concern regarding violations of environmental laws, utilization of outdated planning guidelines, a bias toward servicing motorized flatwater recreation, and failure to consult with Navajo interests. The coalition demanded a revision of the Recreation Area's General Management Plan prior to any further work on the proposed marina.

At issue is a proposal to construct a 410-slip marina, 225-room hotel complex, 150-site campground, fuel dock, convenience store, restaurants and related infrastructure over a 950-acre site; 710 of which are owned by the Navajo Nation, with the remaining 240 administered by the Park Service. Of major concern is that the project evolved from a planning document which is 23 years-old and has little relevance to the reservoir's current operation.

The Diné Bidziil Coalition, representing 17 grassroots Navajo groups, and the Diné Medicinemens Association are opposed to the project, as it would impact ceremonial and sacred sites, and promote inappropriate development on the Navajo Reservation. "Our people will derive virtually no benefits from this project, only a few low-wage jobs and some lease payments. The bulk of the money flows off the reservation to a non-Indian company in Scottsdale Arizona," says Hazel James, with the Diné Bidziil Coalition. "Most families on the reservation live near or below the poverty line; we don't have houseboats and jet skis to take on Lake Powell reservoir."

"Their documents claim that they consulted with us about sacred site impacts, but no consultation ever occurred," said Thomas Morris Jr., president of the Diné Medicinemens Association. Federal regulations require the National Park Service to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners, and to avoid adversely affecting the physical integrity of such sites.

Despite this proposal being the most substantial development initiative at Lake Powell reservoir in decades, the Park Service has done only cursory environmental analysis. The likely impact on water, air, noise, and public health, not to mention the cumulative development impacts on the surrounding community, compel the Park Service to undertake an Environmental Impact Statement. More importantly, the Park Service must reassess the perceived need for this new resort marina in light of declining visitation, which is down 11 percent since 2000 and 35 percent since 1992.

LIVING RIVERS is now mobilizing legal assistance to further support Navajo activists in their efforts to stop development at Antelope Point.

River News 05/16/02

Living Rivers announces the founding of River Runners for Wilderness

RRFW RIVER WIRE No. 1

New Organization to Launch Lee's Ferry, AZ

River Runners For Wilderness (RRFW), a new river resource protection organization, has formed as a direct response to the threats to the wilderness reaches of the Colorado River basin. RRFW will formally launch June 15, 2002, at the boat ramp at Lee's Ferry, Arizona.

"There's just no other multi-day wilderness white water river run like the Grand Canyon. As river runners, we want to do our utmost to preserve this wilderness resource, while maintaining fair and equitable river access for all river runners," said Jo Johnson, RRFW Grand Canyon coordinator, as she discussed reasons to launch a new group. "The National Wilderness Preservation system is missing a key resource in the Colorado River in Grand Canyon National Park. There's no other group dedicated to wilderness river running. Once you embrace wilderness management, many of the conflicting river issues we see today are resolved."

Longtime wilderness advocate Jeff Ingram, also with RRFW, is pleased to see this issue alive again. "The public, as it did every time it had a chance in the 1970's & 1990's, will support a motor-free Grand Canyon Wilderness. Lets not let the same Hatch-Watt-Marks back room ploy be used again. Let's work for an open, public, democratic process on wilderness and river management, starting with a comprehensive Park Service planning effort and ending with a Congressional establishment of a real, complete Grand Canyon Wilderness."

Among those excited to see the new organization get underway is Tom Martin, also a RRFW Grand Canyon coordinator. "The do-it-yourself, muscle-powered river runners wait in an almost 8000 river-trip-long backlog, while the park's river outfitters continue to make a mockery of the river wilderness. The 32 folks on an outfitted trip pay a king's ransom to see the canyon on motorized tour boats operated by unpaid or underpaid river guides, then end their trip boarding a waiting helicopter at the river's edge less than 2/3 of the way through the canyon. What kind of wilderness is that?"

The group will host a "launching" party at Lee's Ferry, Arizona, on Friday afternoon/evening, June 14, and Saturday, June 15, 2002, in concert with Living Rivers and the Grand Canyon Restoration Coalition. The launch will be part of Living Rivers 700 mile long "Sediment-al Journey," building support for the restoration of Grand Canyon and the reformation of the Bureau of Reclamation. Festivities will get underway with a cookout and program talk Friday evening, followed by river music, dance and good cheer. Saturday morning will begin with outreach at the boat ramp, then a ceremony commemorating the founding of RRFW. This will be followed by a float from Glen Canyon Dam back to Lee's Ferry where the festivities will continue into the evening. Among the participants include: Jeff Ingram, a longtime Grand Canyon wilderness activist; Kim Crumbo, a Colorado River guide, former wilderness coordinator for Grand Canyon National Park, and currently the Grand Canyon representative for Arizona Wilderness Coalition; John Weisheit, a Colorado River guide and conservation director for Living Rivers; Brent Blackwelder, president of Friends of the Earth and veteran of 400 successful dam fights over 32 years; musician and author Katie Lee; and additional riverside music from Peg Millet, Bill Oliver and Peter Neils. LR Press Release 05/17/02

No Cause for Celebration: Groups to Protest 100th Anniversary of Bureau of Reclamation

Launching "Sediment-al Journey" to Save the Colorado River in Grand Canyon National Park

Contact:

Owen Lammers (435) 259-1063
Lisa Force (480) 990-7839

One month from today, on June 17, the nation's leading dam building organization, the Bureau of Reclamation (BuRec), will be celebrating 100 years of river manipulation at Hoover Dam. Living Rivers, in conjunction with more than sixty other environmental and

social justice organizations, will also convene at Hoover Dam that day, but will be articulating a much different message.

"There's no cause for celebration; this should be a wake," says Owen Lammers, executive director of Living Rivers. "Thousands of river miles, critical habitat for endangered species and the cultural heritage of a number of indigenous tribes have all been devastated by the 600 dams BuRec has constructed in the western United States."

Nowhere is BuRec's damage more apparent than in the world-renowned Grand Canyon, just upstream of Hoover Dam. Twenty per cent of the Grand Canyon was inundated by Hoover Dam, while the remainder of the Canyon's river corridor is seeing its native ecosystem completely disappear as a result of BuRec's second largest dam, Glen Canyon, 370 miles upstream of Hoover.

Glen Canyon Dam has changed the Colorado's natural flows, its seasonal variations in water temperature, sediment and nutrient deposition and fish migration into and out of Grand Canyon. "The Canyon's entire food web is being dramatically altered. Three of eight native fish species are gone and two more are on their way. The beaches, so revered by the Canyon's river runners, are going as well and all at the hands of BuRec," says Michelle Harrington with the Center for Biological Diversity.

To highlight the damage BuRec has caused, especially to Grand Canyon, the groups will be conducting a five-day, 700-mile, six-stop road show, which will conclude June 17, at Hoover Dam. Known as the Sediment-al Journey, they will be traveling by caravan led by a dump truck which will be collecting, then delivering, sediment and nutrients to the Grand Canyon ecosystem. According to Grand Canyon National Park's retired science director, Dave Haskell, "Lack of sediment in the canyon is a huge problem that needs to be dealt with now. Glen Canyon Dam presents the most serious threat to the Park."

"It's time for BuRec to get on with the task of decommissioning Glen Canyon Dam," says Tori Woodard, conservation director of the Sierra Club's Glen Canyon Group, which is co-sponsoring the Journey's kick-off rally near Moab, Utah on June 13. "BuRec must take responsibility for the damage it has caused and get on with the task of reviving the Colorado River."

"BuRec has submerged so many of our sacred sites and destroyed this principle artery of mother earth and vital part of our people's culture," adds Thomas Morris, president of the DinÈ (Navajo) Medicinemens Association, which will be co-hosting the Journey's second stop adjacent to Lake Powell reservoir and at Glen Canyon Dam.

The Journey will then spend two days in Grand Canyon. The first will be at Lee's Ferry meeting with those preparing for launching their Grand Canyon river trips, then for a Grand Canyon gathering and folk concert at the amphitheater near the South Rim's concession area. Then it's off to Hoover Dam for the rally in advance of BuRec's official event.

"The situation at Grand Canyon and the Colorado River are merely a sampling of the destruction BuRec has caused," says Brent Blackwelder, president of Friends of the Earth and veteran of more than 400 successful dam fights across the US. "From the Columbia to the Rio Grande, BuRec has been wasting taxpayer money subsidizing low-value crop production for cattle feed. It's time to end this practice and bring these rivers back to life."

"It's bad enough that BuRec has dammed-up rivers here, but its destructive legacy extends to rivers all over the world. From the Amazon to the Yangtze, BuRec consultants have traveled the globe spreading their concrete message—something nobody should be celebrating," adds Juliette Majot, executive director from International Rivers Network.

Sedimental Journey Gets Underway

Groups Protesting 100 years of River Destruction by the Bureau of Reclamation Five Day Tour Begins Today to Save the Colorado River through Grand Canyon National Park

Contact: Owen Lammers (435) 259-1063, (435) 260-2590

Lisa Force (602) 321-1753

MOAB, UT From the banks of Colorado River near Canyonlands National Park, a caravan of activists departs today for Hoover Dam, site of the Bureau of Reclamation's (BuRec's) centennial festivities that take place next Monday, June 17th. With banners proclaiming "600 dams, 100 years is too much," and "Save Grand Canyon from Glen Canyon Dam" the group will host a series of events along the way to draw attention to negative environmental and cultural impacts caused by BuRec's dam-building legacy, especially to the world-renowned [Grand Canyon National Park](#).

Leaders from Living Rivers, the Sierra Club, Friends of the Earth and others, representing a network of more than eighty environmental and social justice organizations, will be demanding immediate action by BuRec to restore the river canyon through one of the world's most famous national parks. "This represents the largest grassroots movement assembled for Grand Canyon advocacy since BuRec's plans to inundate the Park with two major dams were defeated over forty years ago," says Owen Lammers, executive director of Living Rivers. "Stopping those dams clearly was not

enough, because the operation of BuRec's Glen Canyon Dam upstream has caused a slow, but nonetheless lethal blow to Grand Canyon's ecosystem."

- Grand Canyon's food web has been completely transformed, causing the loss of all native insect species.
- Four of eight native fish in Grand Canyon have disappeared, while two more are almost gone.
- Mammals such as muskrats and beavers are gone from the river corridor.
- Riparian vegetation in the Canyon's high water zones has disappeared.

This decline is occurring because: ninety five percent of the sediment and nutrients that once flowed into Grand Canyon is now trapped behind the dam; seasonal flow fluctuations critical for building beaches and spawning habitat no longer occurs, and water released from the dam is nearly a constant 46 degrees F, whereas the native system requires temperatures in excess of 80 degrees.

"We will be traveling to Hoover Dam to reinforce the growing public outcry to reverse the damage BuRec is causing in Grand Canyon, the Colorado River watershed and rivers across the Western United States, " says Brent Blackwelder, president of Friends of the Earth. "What's happening in Grand Canyon is emblematic of the problems we're now experiencing throughout BuRec's 600-dam plumbing system."

In a [three-page declaration](#) to be presented to the BuRec at Hoover Dam the 82 groups will be calling for:

- The restoration of essential sediment and nutrient flows from the main stem Colorado into Grand Canyon.
- The restoration of natural flow regimes to properly transport this sediment within Grand Canyon, when and where it belongs.
- The restoration of more natural seasonally variable water temperatures in the main stem Colorado through Grand Canyon.
- Development of a restoration and recovery program for the Colorado River corridor in Grand Canyon that includes the full recovery of all species known to be native to Grand Canyon prior to the operation of Glen Canyon Dam.

"BuRec's efforts to correct these problems with modification of the dam's operations will continue to fail because they only address a tiny part of the problem, modification of flows," adds Lammers. "No feasible plan exists to address the lack of sediment and nutrients, water temperature or elimination of non-native species."

"This is why we support decommissioning Glen Canyon Dam," says Sierra Club board member Ed Dobson, who lives along the San Juan River in Bluff Utah." We must get on with the task of reviving Grand Canyon's dying river ecosystem."

Grand Canyon's ecosystem also represents a critical part of the cultural heritage of a number of Native Nations, including the Navajo, Hopi, Zuni, Havasupai, and Halapai. "BuRec must restore the natural flow regime to the Canyon's artery," says Cal Seciwa, Zuni tribal member and director of academic affairs for the American Indian Institute at Arizona State University. "The ecosystem functioned for thousands of years without

intervention, and will thrive for thousands more once these shortsighted manipulations cease."

En route to Hoover Dam, the groups will host events at: Lake Powell Reservoir and Glen Canyon Dam; Lee's Ferry Campground, launch site for Grand Canyon river trips; and the amphitheater near Grand Canyon National Park's South Rim. Titled "Sediment-al Journey" the caravan will be led by a dump truck which will be transporting much needed sediment and nutrients to Grand Canyon's river corridor.

Hoover Dam site of celebration, protests Monday

By Jace Radke

Las Vegas Sun

While the Bureau of Reclamation celebrates 100 years of existence with a gala at Hoover Dam Monday, environmental activists are planning to protest the effects that dams have on the ecosystem.

About 30 protesters are expected at Hoover Dam Monday morning, a few hours before Secretary of the Interior Gale Norton, Bureau of Reclamation Commissioner John Keys, Gov. Kenny Guinn and other dignitaries are scheduled to arrive.

Owen Lammers, executive director of Living Rivers, an organization dedicated to preserving natural ecosystems, said his group believes the celebration should be more like a wake.

"Thousands of river miles, critical habitat for endangered species and the cultural heritage of a number of indigenous tribes have all been devastated by the 600 dams that have been constructed in the Western United States," Lammers said.

Dams act as obstacles to the natural flow of rivers and sediment -- which has led to the deterioration of ecosystems in places such as the Grand Canyon, Lammers said.

Lammers plans to have about 30 people and a dump truck full of sediment at the protest to bring attention to what he calls the West's failing river ecosystems.

"Our main focus is on Glen Canyon Dam (a Utah facility that created Lake Powell)," Lammers said.

"It is restricting the flow of sediment into the Grand Canyon, while Hoover Dam is farther down river and not causing these types of problems in a national landmark.

"We'll always have the geology in the Grand Canyon, but the flora and fauna (are) disappearing, and all we'll be left with is a lunar landscape."

Bureau of Reclamation spokesman Barry Wirth acknowledged that dams can hurt ecosystems, but said that dams are very much needed.

"There are 25 million people in seven states that rely on the water that Glen Canyon Dam provides from a river that would otherwise serve only three million people," Wirth said.

The Bureau of Reclamation is experimenting with flow releases designed to replace sediment in the Grand Canyon and build up beaches and areas for plants and animals to thrive, Wirth said.

The protest will be held on the Arizona side of the dam in a parking area, which will be as close as protesters will be permitted because of security precautions.

About 2,000 invited guests are expected, and Bureau of Reclamation Police will work with Metro Police, Nevada Highway Patrol, Arizona Department of Public Safety and the FBI to ensure security at the event.

The portion of U.S. 93 that runs over the dam will be closed to vehicle traffic from noon until midnight Monday, Bureau of Reclamation spokesman Bob Walsh said. Travelers are advised that traffic will be detoured through Laughlin and Searchlight via U.S. 95 and State Route 163.

Norton is expected to give a keynote address at the event, which will also feature a flyover by the U.S. Air Force Thunderbirds, fireworks and a laser show on the face of the dam.

The event is not open to the public.

LR in the News 06/14/02

Hoover Dam centerpiece of Reclamation Bureau's celebration

Associated Press

LAS VEGAS (AP) - The Bureau of Reclamation's yearlong 100th birthday party begins Monday at Hoover Dam with dignitaries, a laser light show and the sound of protest.

"The Hoover Dam was chosen because it's a recognizable American icon," said bureau spokeswoman Dana Mishoe of the monument that draws 1.2 million tourists annually and is considered one of the nation's greatest engineering feats.

Some of the bureau's former employees and current partners are expected to be among the estimated 2,000 guests of the 8:30 p.m. program on the dam. Plans call for an Air Force fly over, fireworks and a sound and laser show.

Expected to participate are Interior Secretary Gale Norton, Reclamation Bureau commissioner John W. Keys III, Nevada Gov. Kenny Guinn, Arizona Gov. Jane Hull and U.S. Rep. Ken Calvert, R-Calif., chairman of the House subcommittee on water and power resources.

The celebration will close U.S. 93 - the main route from Las Vegas to Phoenix - south of Boulder City and north of Kingman, Ariz., from noon to midnight. Traffic will be rerouted to U.S. 95 and State Route 163 through Searchlight and Laughlin, authorities said.

Dam traffic has been closed to commercial trucks since Sept. 11 due to security concerns. Limited dam tours resumed in December after all access around the dam had been restricted.

The Hoover Dam, built some 30 miles southeast of Las Vegas in the 1930s, is among the Bureau of Reclamation's 180 water projects in 17 Western states. It provides drinking water, electricity and recreation to 23 million people in the Southwest.

President Theodore Roosevelt created the bureau with the Reclamation Act of 1902 to provide water to Western farmers. Today the bureau is faced with balancing endangered species against the needs of large-scale agriculture, industry, growing cities and Indian tribes - a task that some say it has failed.

Some 100 activists have a permit to gather at 11 a.m. on the dam's Arizona side parking lot to protest what they say are the negative impacts caused by bureau's dam-building legacy, specifically to the Grand Canyon National Park.

Leaders of groups including the Sierra Club and Friends of the Earth, representing a network of 82 environmental and social justice organizations, will demand that the bureau develop a restoration plan for the river canyon, said Owen Lammers, Living Rivers executive director.

"This is really the largest coalition that has come together since the 1960s when they fought the bureau's plans to inundate the (Grand Canyon) park with two major dams," he said.

The protest is expected to last an hour because of the road closure.

"Clearly we have a message that they don't want to get mixed up with theirs," Lammers said.

To address the debate about the bureau's responsibilities, a symposium of experts from federal agencies, universities and the private sector is scheduled Tuesday and Wednesday at UNLV.

LR in the News 06/15/02

Sedimental Journey' makes stop in Page

By Todd Glasenapp

Arizona Daily Sun

PAGE -- An environmentalist group that wants to see the end of Lake Powell made its first Arizona stop Friday on a five-day "Sedimental Journey."

Moab, Utah-based Living Rivers brought a dump truck, director Owen Lammers, three singers and the president of the Dine Medicinemen's Association.

The presentations at Antelope Point and Glen Canyon Dam were similar to the one conducted by Living Rivers' predecessor, Glen Canyon Action Network, at the dam in March 2000.

This time, Living Rivers primarily wants to call attention to sediment buildup above the dam, robbing the Grand Canyon of precious nutrients and altering the canyon ecosystem. The group is driving a dump truck, destined for the other side of the dam.

But the National Park Service said Living Rivers needed a permit to redeposit the three tons of sand, drawn from sand bars at a kickoff rally Thursday night in Moab.

The tour, to coincide with the 100th anniversary of the founding of the U.S. Bureau of Reclamation, continues today with a stop at Lees Ferry and tomorrow's program at the South Rim tomorrow. The 700-mile trip concludes with Monday's rally at Hoover Dam.

Criticism of the proposed \$75 million resort-marina was the main topic of the day's first stop, at Antelope Point, a few miles east of Page on Lake Powell.

Only half a dozen Living Rivers members and about 25 curious onlookers -- most of them law enforcement officers and reporters -- attended the shadeless program near the closed Antelope Point boat launch in 95-degree heat. Lammers expects much bigger turnouts as the tour progresses.

Lammers has said Living Rivers is considering a lawsuit about Antelope Point, citing an "only cursory environmental analysis" by the Park Service in the way of an environmental assessment.

The Park Service and Navajo Nation have retained URS Corp. of Phoenix to prepare an environmental assessment. The assessment is expected to be released this summer with construction beginning not long after. Development in the area began with a launch ramp three years ago. But dropping lake levels have rendered the ramp useless this summer.

Lammers suggested that the Navajo Nation take on nearby Wahweap Marina and abandon plans for the one at Antelope Point to avoid disrupting sacred sites.

Water lobbyist to the Navajo Nation Council Max Goldtooth attributed the drought to dams, saying that offerings are being blocked in their journey to the ocean. He cited traditional beliefs.

"White Shell Mother lives in the ocean," he said. "She's willing to bless us with rain. But the offering never comes. That's why we have a drought. "These places here, these sacred cliffs, you can hear the echoes of those people in them," Goldtooth said.

Thomas Morris, president of the Dine Medicinemens Association, said: "We have polluted the water and sky. Mother Earth has been damaged ... When are we going to learn the people are destroying the healthy sacredness?"

Friends of Lake Powell's Ostapuk said, "If Living Rivers really cared about the Navajo people, they would have come here today with water in their trucks and spent the day hauling water to drought-stricken Navajo water supply systems."

Watching from a distance was Thomas Boyd, acting director of the Navajo Nation Tourism Department. Boyd declined an invitation to take the microphone.

Projections supplied by Boyd indicate the resort-marina will provide 150 permanent jobs, 175 temporary positions, \$10 million in approximate annual payroll, \$30 million in annual community economic impact and other opportunities for Navajo-owned small businesses.

A 'Sedimental Journey' on the Colorado

By Brent Israelsen

Salt Lake Tribune

Hauling a dumptruck full of sand from the Colorado River near Canyonlands, an environmental group plans to ceremoniously throw the sand into the river today below Glen Canyon Dam.

It would be the first time in nearly 40 years that sediment from the upper Colorado River Basin has found its way into the Grand Canyon.

In the scheme of all things ecological, this modest transfer of earth does not amount to a hill of beans.

But Living Rivers, a group based in Moab, is hoping its "Sedimental Journey," which coincides with Monday's 100th anniversary celebration of the U.S. Bureau of Reclamation, will illustrate the plight of the sediment-starved lower Colorado River.

Before 1963, when the gates to the newly built Glen Canyon Dam were closed, sand and silt in the upper Colorado River Basin eventually swirled in the depths of the Grand Canyon, providing nutrients for plants, habitat for fish and beaches for river runners.

Those sediments, millions of tons per year, now wind up on the bottom of Lake Powell, the reservoir behind the dam.

By the 1980s, scientists began documenting dramatic changes in the river's ecosystem as a result of the dam, which was at that time operated primarily to produce hydropower. The dearth of sediment, the drop in water temperature and the unnatural flows below the dam contributed to the extinction of four fish species and the near-extinction of four others, which are now on the endangered list.

A coalition of environmentalists is calling for the river to be restored.

Ultimately, the best solution is "decommissioning" -- knocking down or bypassing -- Glen Canyon Dam, said Owen Lammers, Living Rivers director.

"If we are going to protect and restore the integrity of the Grand Canyon ecosystem, the decommissioning is the most viable option. It is inevitable anyway," he said.

The bureau is not considering such an option. Instead, it is concentrating on altering dam operations to take advantage of sediment deposits from tributaries below.

For example, last month, the bureau's Glen Canyon Dam Adaptive Management Work Group recommended to Interior Secretary Gale Norton that the dam's releases be reduced this fall to conserve sediment deposited by the Paria River during the monsoons of late summer. Releases would then be ramped up in January to force those deposits onto the shores and into the backwaters where they are beneficial to fish, flora and fauna.

Randy Peterson, who directs the adaptive management program, believes this experiment will be more effective than the much-publicized beach-building flows the agency released from the dam in 1996.

Lammers was less optimistic, noting that no change in dam operations can overcome the fact that 95 percent of the Grand Canyon's pre-dam sediments came from upstream of the dam.

The Sedimental Journey ends Monday at Hoover Dam, where Living Rivers plans to hold a rally and protest. Later that evening at the dam, the bureau will stage a \$400,000 celebration of its 100th anniversary.

Bureau's birthday celebration to be met with protest

By Luke Turf
Yuma Daily Sun

Protesters plan to crash the party before the U.S. Bureau of Reclamation can blow out the candles on its 100th birthday cake.

The protest, set for Monday, is directed at the bureau's control of the Colorado River.

Yuma Audubon Society Conservation Chairman Cary Meister said the bureau has done some good scientific studies recently, but that 100 years of dam construction without considering the environmental effects has taken a toll on the river's natural ecosystem.

"Unfortunately now we're paying some of the prices for that," Meister said. And though no one can argue the management of the river — or mismanagement, depending on who you talk to — allowed Yuma to blossom into an agricultural haven, that transformation had a price.

"What the agency is really celebrating is 100 years of environmental devastation and unsustainable human population growth in the arid West," said David Hogan, rivers' program coordinator for the Center for Biological Diversity. "This legacy continues with the agency's turning a blind eye to harm it's causing to the Colorado River Delta in Mexico, among many other issues."

The delta has been a concern for environmentalists because the Colorado River no longer reaches the Sea of Cortez. The delta's fragile ecosystem depends on water making it to the area, which is home to several species listed for protection under the Endangered Species Act. Now, since no Colorado River water makes it to the area, the delta is literally hanging on to life thanks to a small amount of agricultural runoff water from the Wellton-Mohawk Irrigation and Drainage District. However, with more Colorado River water, the delta would flourish.

Virtually the entire river is diverted before it reaches the sea. The United States is allocated 10 times as much water as Mexico, and environmental advocacy groups have filed lawsuits charging the bureau needs to consider the impacts its activities are having south of the border. They contend the bureau needs to focus on restoring the natural ecosystem in the next 100 years, since they destroyed it in the first 100 years.

But the bureau isn't going to focus on restoring the natural environment, said Colleen Dwyer, an agency spokeswoman. She said the bureau wants to work within the existing framework of river management to allow for wildlife to live in harmony with the current water delivery system.

The groups also are trying to get state and federal govern- mental bodies to allocate more water to cross the border and a promise from Mexico that any additional water allocations will make it to the delta, and not just be consumed between the border and the delta.

The environmental advocacy groups say getting that guarantee from Mexican officials likely will be the most difficult part of saving the delta. So they also want to work with Mexico to make its water use more efficient, allowing some of the water Mexico now receives to reach the delta, rather than being wasted by poor irrigation methods.

At the same time, they'd also like to see more efficiency north of the border.

"Other dams and diversions can be managed to leave more water in the river so as to better protect the natural river wildlife and vegetation," Hogan said.

The protestors are gathering at Hoover Dam Monday, where the bureau is also celebrating, to protest what they call the bureau's mismanagement of the river.

"The Bureau of Reclamation has 49 dams along the Colorado River, but there's only one Grand Canyon," said Steve Glazer, chairman of the Sierra Club's Colorado River Task Force, which is also protesting.

Many environmental groups advocate tearing down Glen Canyon Dam, or draining its reservoir to improve river flows and protect the Grand Canyon. The groups say enough water is tied up in the river's other dams and that the dam at Glen Canyon impounding Lake Powell is unnecessary.

The Grand Canyon, they say, is threatened because the lack of natural river flow creates a lack of nutrients which causes beach and native wildlife loss. Non-native sport fish also have crippled the native fish populations, they say.

"We're not saying remove all game fish from the area," Hogan said. "We're saying there needs to be a balance, and right now there is not a balance."

Living Rivers, another environmental advocacy group, is guiding the "Sediment-al Journey" along the river to show the negative effects the bureau allegedly has created in the Grand Canyon and along the rest of the Colorado.

The main problem lies in a buildup of sediment, the fine clay and course sand that is a natural result of weathering and the basis of the ecosystem's food chain — insects survive off the minerals in the water from the sediment and fish eat the insects. According to Living Rivers officials, 95 percent of sediment and nutrients that once flowed through the Grand Canyon are now trapped behind Glen Canyon Dam, crippling the river downstream.

"The river is no longer a natural river ecosystem, it is a highly managed conveyance system," Hogan said.

River News 06/17/02

Grand Canyon's Colorado River –The Facts

What is the Grand Canyon? The Grand Canyon and the region it defines includes thousands of square miles of incised canyons, mesas and volcanoes overlain by a web of drainages that feed into the Colorado River, which carved the canyon. The Colorado River in Grand Canyon National Park is 277 miles long, and the Canyon is about 18 miles wide near the south rim facilities and nearly a mile deep. It was made a national park in 1919.

Where is the Grand Canyon? In northwest Arizona, bordering Utah. The south rim of the canyon in Grand Canyon National Park is most often accessed from Hwy 180 out of Flagstaff, Arizona. The north rim is most often accessed from Hwy 89 out of southern Utah.

What is the cultural history of the Grand Canyon? Human habitation of the canyon goes back at least 10,000 years to the Clovis and Folsom cultures, who were sophisticated big-game hunters. When the climate changed to warmer and drier conditions, another culture called Desert Archaic existed from 6500 BC to 1 AD. The farming cultures, known as Basketmaker and Puebloan, inhabited the Grand Canyon until about 1275 AD. Many modern-day cultures trace their origins to the canyon, including 34 Hopi clans. The Havasupai still live in the canyon and consider themselves its guardians.

What impact has the US government had on the canyon and the Colorado River? The Bureau of Reclamation (BuRec), an agency of the US Department of the Interior, was formed in 1902 to build water projects in the West. In 1935, BuRec began filling the reservoir formed by Hoover Dam. The reservoir filled in 1941 and inundated twenty percent of the Grand Canyon. In 1963, upstream of Grand Canyon, the gates of Glen Canyon Dam were closed, initiating a potentially lethal blow to the Colorado through Grand Canyon.

How have the Colorado River dams impacted the Grand Canyon? The Grand Canyon ecosystems are collapsing because Glen Canyon Dam has prevented sediment and nutrients from flowing into the canyon, lowered the water temperature, and eliminated life-giving floods. What is sediment? Sediment comes from natural weathering processes, such as rain and ice, and is typically composed of fine clay and coarse sand. In natural systems, sediment is eventually transported by flowing water to the sea. The Colorado River drains an area of soft rocks and is one of the muddiest rivers in the world. The plants and animals that depend on the Colorado River evolved with this high-sediment system.

Why is sediment important? Organic materials are mixed into the sediment matrix and provide the carbon necessary for tissue growth. Organisms such as insects depend on these nutrients and provide the base for the ecosystem's food chain. Of the 50 + species of native insects that once formed the natural food base for the Grand Canyon, none remain. The unnatural water temperature is another reason why the native insects do not reproduce. Because the Colorado River runs clear, a green alga called *cladophora* grows abundantly. This is an unnatural food source for native fish and has replaced the natural food web. Sediment deposits also form the Canyon's beaches and sandbars, which in turn provide habitat for the plants, birds and mammals that evolved with this muddy river.

Doesn't any of the sediment get through the dam? Ninety-five percent of the sediment and nutrients that once flowed through Grand Canyon's riverine ecosystem are now trapped behind Glen Canyon Dam.

Why have water temperatures changed? Water is released through large pipes (penstocks) built into Glen Canyon Dam and turns large turbines that produce electricity. The water enters the penstocks at a depth of about 200 feet below the surface of Lake Powell, the reservoir formed by Glen Canyon Dam. Because the sun's rays cannot penetrate water at that depth, the water is very cold. When the water exits the dam's power plant and flows as a river once again, the temperature is about 47 ° F.

Previously, when the Colorado River flowed in its natural riverbed, water temperatures reached 80 ° F in the summer. It was these warm temperatures that triggered animal reproduction. Non-native fish, such as trout, thrive in the artificially cold water and compete with the native fish for available food. They also prey on the few native fish that manage to reproduce in the warmer waters of the Little Colorado River, a tributary of the Colorado 75 miles below Glen Canyon Dam.

Why are flood flows important? Natural flows in the Grand Canyon fluctuated seasonally from 3,000 to 90,000 cubic feet per second (cfs). A cubic foot is about eight gallons of water. Every spring the melting snows from the Rocky Mountains brought a rushing torrent of water into the Canyon. The floods moved the sediment around to form new beaches and sandbars (beaches naturally degrade due to water and wind erosion) and replenished the nutrients high on the shores of the river to be utilized by plants and animals. This process also triggered seed germination for trees such as the mesquite. Now, with dam-controlled flows, the Colorado fluctuates every day between 8,000 to 20,000 cfs, creating a near static flow regime for an ecosystem that is dependent upon a dynamic system of annual recharge.

What has happened to the native species of the Grand Canyon? River otters and muskrats are now gone from the canyon. Four of the eight native Colorado River fish are gone and two more are struggling for survival. Native vegetation is disappearing from the high water zone or is stunted due to the lack of nutrients and the invasion of competing non-native plants.

Has there been any impact on the cultural values of the Canyon? Erosion poses a threat to native burial and sacred sites near the riverbed. The loss of native species represents additional native cultural losses.

What can be done to reverse these impacts? These impacts represent a significant violation of the 1916 Organic Act (which created the National Park Service) and the Grand Canyon Protection Act of 1992. These acts require that the federal government ensure and enhance the natural integrity of Grand Canyon's resources for future generations. This is why a growing nationwide coalition is demanding that the government obey the law and immediately:

- Restore natural sediment and nutrients flows from the Colorado into Grand Canyon
- Restore natural flow regimes to properly transport this sediment within the Canyon
- Restore the natural water temperatures of the Colorado River

What would be the initial steps for accomplishing these restoration goals? The Bureau of Reclamation and National Park Service must develop a recovery program for the Colorado River corridor in Grand Canyon that includes all species known to be native prior to the operation of Glen Canyon Dam. They need to implement a non-native eradication program to rid the Grand Canyon river corridor of alien species with a priority on those that prey on, compete with, or otherwise impair the health of native plants and animals.

How will the other restoration goals be accomplished without removing the dams? It may not be possible to save the Grand Canyon without removing Glen Canyon Dam. Over \$100 million has been spent on science programs in the Grand Canyon, but no viable plan to restore the canyon has resulted. This is not due to faulty science as much as it is to the priority politics of water and power. We must initiate the necessary measures to preserve the Grand Canyon in accordance with our nation's laws before the ecosystem collapses.

Dignitaries, protesters mark bureau's birthday at Hoover Dam

Associated Press

BOULDER CITY, Nev. (AP) - The Bureau of Reclamation began its 100th birthday Monday with a dazzling celebration to light up the Hoover Dam as protesters nearby sought to spoil the party.

Hours before the speeches and fireworks, a group of protesters representing 84 environmental and social justice organizations including Friends of the Earth and the Sierra Club gathered near the bureau's most recognizable icon, calling for repair of the damage they say was created by the Reclamation Act of 1902.

The 100-year-old act launched by President Theodore Roosevelt created the bureau and a federal effort to "reclaim" the Western desert.

"If Roosevelt was here today, I think he would be amazed at all that we've accomplished," said Reclamation Bureau Commissioner John W. Keys III. "Our mission is water management. We're the go-between to provide water where it's needed most."

If the bureau were to sum up its vision for the next 100 years, it would be to work to balance the needs of water users with the environment, Interior Secretary Gale Norton said.

"We're going to be engaged in long-term planning that will allow the bureau to manage its current resources and to find environmentally sensitive ways to obtain more water supplies," she said as she stood atop the dam, a popular tourist attraction 30 miles southeast of Las Vegas.

President Bush, who turned down an invitation to the celebration, congratulated the bureau on what he said was its commitment to environmental protection, access to affordable energy and economic growth.

Some 40 activists, some dressed as fish and carrying signs, gathered on the dam's Arizona-side parking lot in 100-degree heat for about an hour to protest what they say is the negative impact of the bureau's dam-building legacy.

A group of musicians played atop a dump truck filled with Colorado River sediment to symbolize how dams - like the Glen Canyon on the Utah-Arizona line - have reduced water supply and choked off nutrients that nourish downstream habitat.

Owen Lammers, executive director of Moab, Utah-based Living Rivers, said the groups' key message was that while the bureau invested about \$200,000 to mark a century of river management, environmentalists see no cause for celebration.

"We're not there to protest or complain about the work that was done in the early days of the bureau," he said. "The planners weren't interested in ecological impacts. But we would like to see the same ingenuity and spirit applied to the problems that have been created."

The U.S. Air Force Thunderbirds precision flying team of six F-16 Falcons flew over the dam at 6:20 p.m. to kick off the festivities, which included dinner in the power houses on either side of the dam and fireworks and laser shows.

Traffic over Hoover Dam was to be halted and detoured from noon to midnight for the celebration that was to include about 2,200 guests.

"Almost all of the bureau's former commissioners are coming," said spokeswoman Trudy Harlow. Other expected participants included Nevada Gov. Kenny Guinn, Arizona Gov. Jane Hull, and Wyoming Gov. Jim Geringer.

Security was expected to be tight with hundreds of law enforcement agents on hand, bureau spokeswoman Dana Mishoe said.

The Hoover Dam, built in the 1930s, draws 1.2 million tourists annually and is considered one of the nation's greatest engineering feats. It provides drinking water,

electricity and recreation to 23 million people in the Southwest, and is one of the Bureau of Reclamation's 180 water projects in 17 Western states.

Roosevelt created the bureau with the Reclamation Act of 1902 to provide water to Western farmers.

Today it is faced with balancing the needs of endangered species against those of large-scale agriculture, industry, growing cities and Indian tribes.

To address the debate about whether the bureau is meeting its responsibilities, a symposium of experts from federal agencies, universities and the private sector is scheduled Tuesday and Wednesday at the University of Nevada, Las Vegas.

Monday's privately funded party was cosponsored by Water for the West, a nonprofit organization created solely for celebrating the Reclamation Bureau's birthday, Harlow said.

To attend the celebration, individuals had to contribute \$5,000. A \$10,000 contribution allowed a company's logo to be projected on the dam during the program, according to Keith Ashdown, spokesman for Taxpayers for Common Sense.

River News 06/17/02

Declaration for the Restoration of the Colorado River through Grand Canyon

We gather here today atop Hoover Dam on June 17th 2002, the centennial of the founding of the Bureau of Reclamation (BuRec). One hundred years ago Congress passed the Reclamation Act of 1902, spawning an epoch of dam building and river diversion unsurpassed by any resource management agency in the developed world. More than 600 BuRec dams dot the landscape of the 17 western states, with their tallest concrete dam being the one beneath us. Just upstream lay the degraded remains of the once thriving Grand Canyon ecosystem. The demise of this Canyon, one of the seven natural wonders of the world, symbolizes the unnecessary impacts brought upon rivers throughout the West by BuRec's environmentally and culturally destructive policies designed to optimize water delivery.

Although BuRec's present mission states, "... protect water and related resources in an environmentally and economically sound manner in the interest of the American public," the agency has yet to demonstrate a significant commitment to environmental stewardship or to recognize the significant water scarcity problems that future generations will face. BuRec's day-to-day policies remain largely driven by the water and power industries, whose economic viability is largely dependent upon subsidies sponsored by the Federal government. Throughout its domain BuRec's promotion of wasteful water and energy practices has resulted in the loss of functioning rivers, the loss of critical habitat, and the loss of natural and cultural heritage.

Nowhere are these losses more pronounced than in the Colorado River through Grand Canyon National Park. In 1941, as Lake Mead reservoir filled, 20 percent of the Grand Canyon was inundated behind Hoover Dam. In 1963, upstream of Grand Canyon, the gates at Glen Canyon Dam closed, which initiated a slow, and left unchecked, potentially lethal blow to the remainder of the Colorado River through Grand Canyon.

The following impacts on the collapsing Grand Canyon ecosystem are now evident:

... Ninety-five percent of the sediment and nutrients that once flowed into Grand Canyon's riverine ecosystem are now trapped behind Glen Canyon Dam causing the beaches to erode away and the native vegetation to disappear, disrupting the historic food base.

... Seasonal water temperatures that previously fluctuated from freezing to 80 degrees Fahrenheit, now range from 43 to 55 degrees, blocking the warm water necessary to trigger native animal reproduction, and fostering non-native fish species at the expense of native species.

... Natural flows, which fluctuated seasonally from 3,000 to 90,000 cubic feet per second, now can fluctuate only from 8,000 to 20,000, cubic feet per second, creating a near static flow regime for an ecosystem that is adapted to and dependent upon the dynamic pre-dam flow. Public concern about these devastating impacts caused BuRec, in 1982, to establish the Glen Canyon Environmental Studies. In 1992 Congress passed the Grand Canyon Protection Act, and in 1996 new rules were established for altering the operation of Glen Canyon Dam. Unfortunately, a narrow interpretation of these laws has failed to halt the further decline of Grand Canyon's native habitat. Other impacts to the ecosystem include:

... A green non-native algae called cladophora has replaced the natural food mix of macroinvertebrates, such as insects.

... Of the 50 to 100 insect species that once formed the food base of the Grand Canyon, none remain. They have been replaced by 25 alien species.

... Of the eight native Colorado River fish, four are extirpated, and two are struggling for survival. Twenty alien species now thrive in the artificial environment.

... Otters and muskrats are now gone from the Canyon, in part due to loss of streamside wetlands.

... Native riparian vegetation is disappearing from the high water zone, or is stunted due to the lack of nutrients and the invasion of competing non-native plants.

... Erosion poses a threat to native burial and sacred sites near the riverbed, and the loss of native species represents additional native cultural losses.

These changes represent a significant violation of the National Park Service's Organic Act (1916), which requires that the Department of Interior ensure the protection of the natural integrity of Grand Canyon's resources for future generations. The Organic Act

and the establishment of Grand Canyon National Park pre-date the decision to construct Glen Canyon Dam. Whereas numerous alternatives exist to provide for the societal needs associated with Glen Canyon Dam, there are no alternatives to the unique ecosystem that is Grand Canyon National Park. Moreover, according to BuRec documents, safety concerns associated with the continued operation of Glen Canyon dam pose a significant risk to the ecology and to the native cultures throughout the Grand Canyon in the event of dam failure.

Grand Canyon's river corridor environment is also suffering due to the proliferation of motorized watercraft, in what otherwise would be designated wilderness area. Noise and effluent from motor boats are adding additional stress to an already overburdened ecosystem.

The construction and operation of BuRec facilities has brought about the near collapse of the Grand Canyon ecosystem. For over twenty years the public has been demanding action, but the decline has continued. As the Canyon's needs are self-evident, we call upon the BuRec to deliver the following:

- ... The restoration of essential sediment and nutrient flows from the main stem Colorado into Grand Canyon.

- ... The restoration of natural flow regimes to properly transport this sediment within Grand Canyon, when and where it belongs.

- ... The restoration of more natural seasonally variable water temperatures in the main stem Colorado through Grand Canyon.

BuRec and the National Park Service must also cooperate to:

- ... Develop a restoration and recovery program for the Colorado River corridor in Grand Canyon that includes the full recovery of all species known to be native to Grand Canyon prior to the operation of Glen Canyon Dam.

- ... Implement a non-native eradication program to minimize alien species in the Grand Canyon river corridor with a priority on those that prey on, compete with, or otherwise impair the health of native plants and animals.

To aid in the restoration effort and ensure equitable access to a restored Grand Canyon riverine ecosystem we further request management of the Colorado River through Grand Canyon as wilderness, as is currently the policy for the surrounding landscape, precluding the use of motorized watercraft.

The Grand Canyon is a world-renowned resource that demands restoration. It is, however, merely the most famous of river corridors devastated by BuRec projects and policies. We call upon BuRec, on this, its centennial day, to demonstrate to the public its commitment to reversing this damage by reviving the Grand Canyon ecosystem as its first significant step in an agency-wide effort to, as its mission states, "...protect water and related resources in an environmentally and economically sound manner in the interest of the American public."

Dams' role in flux for urban West , Agency rethinks task at 100-year mark

By Shaun McKinnon

Arizona Republic

You can talk about the climate, the citrus, the copper. You can wax rhapsodic about the plentiful land and even air-conditioning. But the truth is, Phoenix would still be a dusty, sparsely populated cow town if it weren't for an unglamorous government agency dreamed up more than a century ago by a one-armed river runner.

The U.S. Bureau of Reclamation was born 100 years ago today with a narrowly defined mission: Water the arid West. Find a way to tame the wild rivers and make the deserts blossom. In other words: Just dam it.

And from the dams the bureau built sprang metropolitan Phoenix : Roosevelt Dam on the Salt River, one of the agency's first undertakings, gave the Valley its first sure water supply and a way to survive the region's unpredictable dry spells. Hoover and Glen Canyon dams on the Colorado River provided the expanding region a place to store even more water and the Central Arizona Project furnished the means to deliver it.

Yet as the bureau celebrates its centennial tonight at Hoover Dam, the agency faces serious questions about its role in the new, more urban West. Many of the original dams and canals were built to serve farmers and, critics charge, are now inefficient and wasteful. Environmentalists accuse the bureau of destroying ecosystems by damming rivers like the Colorado. Some groups want much of what the bureau did undone, beginning with the dismantling of Glen Canyon Dam.

Bureau officials insist they have kept up with changing needs, working with cities to adapt agricultural water projects. They also point to the drought that grips the intermountain West and say the network of reclamation projects is protecting many areas, including Phoenix, from severe water restrictions.

They acknowledge that their mission has evolved from simply building dams and canals to managing a valuable natural resource, a job that may now include knocking down a dam or two.

"It is a different world," said Robert Johnson, the bureau's Lower Colorado regional director. "We have to balance a lot of different interests. In many ways, it's probably as challenging as the historic role of building projects. It takes a different set of skills, but nonetheless it's a very important role." Phoenix was emerging from a disastrous drought when President Theodore Roosevelt signed the Newlands Reclamation Act on June 17, 1902. Many settlers left the Valley after suffering through several dry years that ruined crops and stripped the land of its topsoil. The rivers simply couldn't support traditional farming.

John Wesley Powell, the famed Colorado River explorer, foresaw such trouble and proposed a series of land management reforms that took into account the fickle waters of the West. The one idea that survived was the U.S. Reclamation Service, which was charged with building dams to store water for dry years and control flooding in wet ones.

Roosevelt among 1st

One of the first dams proposed was Roosevelt, about 70 miles northeast of central Phoenix on the Salt River. It created what was, for a while, the largest artificial reservoir in the country. It was also the first dam to serve so many purposes: storing water, controlling floods and generating power.

"I really think the seminal moment in the history of the Valley of the Sun is the building of Roosevelt Dam," said Grady Gammage Jr., a Phoenix attorney and author who sits on the board that manages the Central Arizona Project.

"There's been lots of stuff that's happened since then, a lot of other dams built, and the CAP, but if Roosevelt Dam hadn't been built as one of the very first of the federal reclamation projects, we wouldn't have a city like this. We wouldn't have the storage capacity to support this kind of a population."

Major milestones

Three other milestones in the bureau's history further influenced the development of the Valley and the West:

- Construction of Hoover Dam, which created storage space for nearly 30 million acre-feet of water, or about twice the annual flow of the Colorado River.
- Construction of Glen Canyon Dam, upstream from Hoover, which generates enormous amounts of power for the Southwest.
- Construction of the Central Arizona Project, the 336-mile canal that moves water from Parker Dam to Phoenix and Tucson. Without that water, the Valley would have reached its growth limits by now.

"It's hard to imagine the Phoenix metropolitan area without reclamation projects," said Larry Dozier, the CAP's deputy general manager and a 16-year bureau veteran. "Here we are in the midst of one of the worst droughts in history and central Arizona hardly notices."

Protesters to gather

But not everyone will be celebrating the agency's work tonight. Activists from more than 80 environmental groups have planned a counterevent to protest what they believe is a legacy of ecological neglect at best and wholesale destruction at worst.

The focus of the protest is Glen Canyon Dam, which conservationists say has wrecked the ecosystem of the lower Colorado River and the Grand Canyon. Most of the groups involved support a Sierra Club proposal to drain Lake Powell and decommission the dam.

"The Canyon is an Arizona icon, yet a lot of people don't realize its ecosystem is on the brink of collapse," said Lisa Force, Arizona program director for the group Living Rivers. "It's just so ironic that the bureau is spending tremendous time and money celebrating its own existence while the Grand Canyon and rivers all over the West are suffering from bureau mismanagement."

Construction of Glen Canyon Dam halted the natural flow of sediment down the river and lowered the water temperature significantly. As a result, environmentalists say, many wildlife species have been pushed toward extinction. Four of eight native fish species, for example, no longer live in the Canyon.

Force said dismantling Glen Canyon Dam is not as radical an idea as many people believe it is. The lost water storage could be made up in part by taking more water directly from the river, eliminating losses to evaporation from Lake Powell's surface. She and others also dispute the importance of Glen Canyon's power supply, insisting other sources could easily fill in the gaps.

"We do not expect or even want the bureau to go out and rip out all their dams," Force said. "We recognize some of those dams are vital for power and water. We're suggesting they put responsible management in place, and that begins with water conservation all over the basin."

Johnson, the bureau's regional director, said the changes sought by the environmental groups reflect increasing awareness of such issues throughout the West. But the bureau has to balance changes with the needs of those who hold legitimate water rights.

"Change will occur," he said, "but it will occur slowly and incrementally." For example, he said, both Salt River Project and the CAP are gradually shifting agricultural water to urban uses, while in California, officials are working with farmers to reduce waste.

Gammage doesn't believe the environmental groups will succeed in bringing down Glen Canyon Dam. "There is a legitimate need for that storage," he said. "It isn't just 'dam it because we can.' "

Even Force of Living Rivers admits that gaining widespread public support for the idea won't be easy. But the message she and others are trying to deliver isn't that far removed from the one John Wesley Powell preached when he proposed a reclamation agency in the first place.

"People have to learn that we live in a desert, that this is the arid West," Force said. "We have this false sense that the fed government has conquered nature and has drought and flooding under control. But no matter how many reservoirs we build, no matter how many dams we build, we can never make more water."

Dam hosts centennial celebration

By Keith Rogers

Las Vegas Review-Journal

With fireworks and a laser light show driven by technology that didn't exist 100 years ago, the Bureau of Reclamation celebrated its centennial birthday Monday at Hoover Dam, its proudest achievement.

Hundreds of police officers from numerous law enforcement agencies guarded the 6.6-million-ton concrete dam while 2,200 bureau employees, former employees and invited guests toured the 67-year-old structure and ate dinner below where turbines churn out hydroelectricity.

In an interview before she addressed the throng, Interior Secretary Gale Norton described the \$600,000-event as "a great celebration" of the work the bureau had done over the century.

"They have transformed so much of the West," she said.

The event "also signals the future," she said. "Water continues to be a major issue for the West. With more and more people, the pressure on the water supply keeps growing."

She defended the event's price tag, saying, "It's an unusual opportunity to have a centennial celebration. It's important to remind people about the necessity for water in the West."

Nevada Gov. Kenny Guinn, Arizona Gov. Jane Hull and Wyoming Gov. Jim Geringer were among the invited guests.

Guinn, too, acknowledged the need to mark the occasion, noting the sheer volume of water supplied by the bureau: 10 trillion gallons to more than 31 million people each year.

"Certainly any time you can last 100 years in any program, it's time to celebrate," Guinn said.

A short time later, at 6:20 p.m., the Air Force's aerial demonstration team, the Thunderbirds from Nellis Air Force Base, swooped down in formation, making two, low-altitude passes over the dam with smoke trailing from their red, white and blue F-16s.

Kathy Maybee, a six-year bureau employee, watched the planes pass as she stood atop the dam with family and friends.

"I was joyous that it's still here, that we can still do this. It's still the United States of America," she said.

The nonprofit Water for the West Foundation shouldered about two-thirds of the bill for the event. The foundation, a group of water providers, contractors and power organizations that deal with the bureau, spent more than \$400,000 on the fireworks, light show, transportation, the event program and dinner for 2,200 guests, said foundation President John Sullivan.

A bureau spokeswoman, Trudy Harlow, said the bureau spent about \$200,000 on the celebration, mostly for site preparation and security. The Sept. 11 terrorist attacks spurred the bureau to heighten security at Hoover Dam and officials, who had planned the event for a year, decided to close the dam to traffic for 12 hours beginning at noon.

Motorists heading southbound on U.S. Highway 93 were directed to take U.S. Highway 95 and state Route 168 through Laughlin to get into Arizona.

At the event, bureau Commissioner John Keys lauded the work done in the 100 years since the Reclamation Act was signed by President Theodore Roosevelt. The first project, he said, "Specification No. 1," was Derby Dam on Nevada's Truckee-Carson Irrigation district.

"These were never-before-imagined projects of colossal size, surpassing the technology of the day. Soon, reclamation engineers were pushing the limits of dam building technology. They built larger and higher structures than had ever been thought possible," he said.

Hoover Dam, originally called Boulder Dam, is one of the tallest in the world and it was finished only five years after construction began in 1931.

"Men worked under dangerous and extreme conditions. And they didn't have any of the advantages we have today in terms of machinery or technology," Keys said in his prepared remarks.

About six hours before the festivities began, some 25 environmental activists staged a protest to call attention to the impact of the construction of Hoover Dam and hundreds of others in the West.

The contingent had traveled 700 miles in five days hauling sediment in a 25-ton dump truck from the banks of the Colorado River near Utah's Canyonlands National Park to a parking lot on the Arizona side of Hoover Dam.

Owen Lammers, executive director of the nonprofit group, Living Rivers, based in Moab, said the rally was symbolic because the bureau's Glen Canyon Dam has prevented sediment and nutrients from flowing into the Grand Canyon, affecting the food chain for fish and wildlife.

President Bush weighed in on the celebration in a letter to bureau officials. "These efforts strengthen our nation's economy, ensure the efficient use of limited resources, benefit fish and wildlife and contribute to outdoor recreation opportunities," his message said.

Dam Builder Turns 100 Amid Praise, Criticism

By Brent Isrealsen

Salt Lake Tribune

HOOVER DAM, Nev. -- What do the lake-sized swimming pools on the Las Vegas Strip have in common with artichokes growing in California's Imperial Valley? Neither would be possible without the U.S. Bureau of Reclamation, which on Monday celebrated its 100th birthday.

In festivities marked by fireworks, F-16 flyovers and flowery speeches by top Bush administration officials, the bureau was honored Monday night at Hoover Dam on the lower Colorado River.

Formed in 1902 to store water and generate electricity, the bureau has had an extraordinary amount of influence on population growth and economic development in the arid West, including Salt Lake City, which relies heavily on Reclamation water diverted from the Uinta Mountains.

"Look at the great cities out here in the West -- Boise, Salt Lake City, Spokane, Phoenix, Las Vegas. All were built around Reclamation projects," said Bureau of Reclamation Commissioner John Keys, a Utah resident.

"It was Reclamation that turned the dust and sand to arable soil and the brown to green," said Interior Secretary Gale Norton.

More than 2,000 bureau employees, their families, representatives from Western states and officials from water and power agencies attended the \$500,000 gala, which took place at the bottom of the 67-year-old dam.

Norton thanked past and present bureau employees.

"You [provided] a long, cool drink of water to a parched land," she said. "For this we will be forever grateful."

She and Keys also paid tribute to Hoover Dam, which remains an icon of the bureau's engineering prowess. Impressive even by 21st century standards, Hoover was the first of a series of big dams that would tame all of the West's big rivers.

The bureau today manages 348 dams, which store 245 million acre feet of water. They provide drinking water to 25 million people in 17 states and irrigate farms that account for 60 percent of the nation's vegetables and 25 percent of its fruits and nuts.

The bureau also generates more than 42 billion kilowatt hours of electricity from 58 hydroelectric facilities -- enough power for more than 9 million people.

Keys said the bureau has accomplished the mission President Roosevelt gave it a century ago. "If only Teddy Roosevelt could see us now," Keys said. "He'd be amazed."

Roosevelt, a pioneer of natural resource conservation, also might be chagrined at the environmental devastation caused by the numerous dams, which have forever altered ecosystems, led to the extinction or near-extinction of dozens of fish and other species, and impounded hundreds of pristine places, including Glen Canyon in Utah and the western end of the Grand Canyon in Arizona.

"There's no cause for celebration. This should be a wake," said Owen Lammers, director of Living Rivers, a Moab-based environmental group that protested Monday's gala.

A coalition of environmental groups on Monday called for an overhaul of the Bureau of Reclamation, in particular its management of the Colorado River.

Environmentalists say the bureau should pay more attention to the Grand Canyon, which is losing its beaches and native riparian and fish species at a high rate.

"We're calling on the bureau to invest its next 100 years in protecting and restoring what's been lost," said Jim Wechsler, a Utah representative of the Sierra Club.

In an interview Monday evening, Keys responded, "Where have they [bureau critics] been for the past 10 years?"

Keys said the bureau already has made the shift from its era of dam-building to one of management and environmental restoration. He pointed to a bureau-sponsored "adaptive management" group that is working on solutions to ecosystem problems below Glen Canyon Dam.

But he promised the dam, which environmentalists ultimately want to see removed or bypassed, will be intact 100 years from now.

"People are going to look up there and say, 'What a grand facility that is.' "

Columnist Susan Synder: Dam these difficult questions Las Vegas Sun

This morning I drew water from the tap and poured it into the coffee maker.
I changed the water in the cat's dish, and then filled the watering can.
I watered the banana tree and African violets I inherited from a close friend who moved away. I watered the basil, cilantro and teeny forget-me-nots. I watered the pink geraniums in the guest room and a plant I cannot name, though it is my favorite because it refuses to let me kill it.

I started a load of wash and hopped into the shower.

When this is your daily routine, it's rather sticky to plop down at a computer terminal two hours later and bang out 475 words saying the Bureau of Reclamation's 100th anniversary is cause for a wake rather than the celebration conducted Monday at Hoover Dam.

President Theodore Roosevelt's Reclamation Act of 1902 created the bureau to provide water to the West's farmers. In 100 years it has built more than 180 projects in 17 states. The 67-year-old Hoover Dam alone provides drinking water and electricity to 23 million people.

But bureau adversaries say these projects are killing the West. About 400 miles upriver from Las Vegas is Glen Canyon Dam, which created Lake Powell on the Utah-Arizona border. Researchers were given barely three months to excavate and study Glen Canyon's more than 3,000 Indian cultural sites before the bureau flooded it with Colorado River water in 1962.

Downriver from Lake Powell, the Grand Canyon rewards those who sweat it out to the bottom with an ecosystem possessing beauty that defies description. Beaver, otter and muskrat once lived there. But we didn't get to see them.

Environmentalists say they have disappeared along with native flora and fish species because dams such as Glen Canyon trap nutrient-bearing sediments and ruin seasonal changes in water flow.

The Grand Canyon is dying.

But without the dams, reclamation bureau officials say we wouldn't have water for the irrigation and electricity that has allowed most of us to settle in the West.

Told you this was sticky. Do we want coffee and forget-me-nots in the kitchen every day or unparalleled beauty at the bottom of the Grand Canyon once in a lifetime?

We want both. But at what price?

"Thousands of river miles, critical habitat for endangered species and the cultural heritage of a number of indigenous tribes have all been devastated by the dams BuRec has constructed in the western United States," Owen Lammers, executive director of Living Rivers, has said.

Lammers and a group of Living Rivers supporters left Moab, Utah, on Thursday with a dump truck of sediment and stopped at Lake Powell, Lee's Ferry in Arizona and the Grand Canyon's South Rim before arriving at Hoover Dam Monday. They staged a demonstration a few hours before the bureau's laser light show and gala.

Living Rivers members say the bureau needs to overhaul its manner of doing business, including properly collecting water-delivery costs from corporate farmers and closing projects such as Glen Canyon Dam before it is too late.

It's a sticky spot. The ever-elusive "win-win" for which government officials strive doesn't seem to exist. Someone has to lose. But who?

Bureau has birthday bash at Hoover Dam

By Jace Radke

Las Vegas Sun

The workers who built Hoover Dam in the 1930s were used to the explosions that thundered through Boulder Canyon to make way for the dam.

On Monday night some of those same workers again heard the sound of explosions reverberating through Boulder Canyon, as the Bureau of Reclamation celebrated its centennial by lighting up the sky over Hoover Dam with fireworks.

Interior Secretary Gale Norton joined Gov. Kenny Guinn and a crowd of more than 2,000, including current and former Bureau of Reclamation employees, to celebrate the agency's role in bringing water and power to the Western United States.

Norton called the bureau's history "a century of progress, a century of making the arid west bloom."

"(The Bureau of Reclamation) has changed the course of rivers, filled irrigation ditches, enabled new communities and fed a hungry nation," Norton told the crowd assembled at the base of the dam, the agency's premier project.

Guinn said that the Bureau of Reclamation's legacy is seen in mammoth structures like the 726-foot Hoover Dam.

"Hoover Dam is often defined as one of the wonders of the world," Guinn said. "Before the Bureau of Reclamation built the dam Las Vegas was little more than a hot and dusty railroad stop between Los Angeles and Salt Lake City."

Carl Hoffman, a 94-year-old who helped design the dam, said Guinn was right with his characterization of Las Vegas in the early '30s.

"This is the thing that made the West," Hoffman said. "When I came in 1933, Las Vegas was just a whistle-stop."

Hoover Dam meets the domestic water and irrigation needs of more than 18 million people in Nevada, Arizona and California. The dam generates 4 billion kilowatt-hours of electricity a year, enough to serve 1.3 million people.

While Hoover is a major project, the Bureau of Reclamation operates a total of about 180 projects in 17 Western States, providing water to about 33 percent of the population

in the American West. Dams and Bureau of Reclamation power plants generate more than 34 billion kilowatt-hours of electricity a year.

While the electricity and water provided by reclamation projects is easily identifiable, protesters argued that the projects can harm ecosystems and destroy environments.

About 40 activists parked a dump truck full of Colorado River sediment on the Arizona side of the dam Monday morning.

Owen Lammers, executive director of Living Rivers, an organization dedicated to preserving natural environments, said that dams stop rich sediment needed by plants and animals from traveling down river.

Bureau of Reclamation Commissioner John Keys, said that he understood the concern and that the bureau is looking at ways to address the problem.

"The dams are here," Keys said. "We're not going to spend money to decommission dams, but we will spend money to find ways to adapt."

The Bureau of Reclamation has experimented with flow releases on the upper Colorado River designed to replace sediment in the Grand Canyon and build up beaches and areas for plants and animals to thrive. The last releases were in 1996, and they could again be used this winter, Keys said.

Although the protesters were allowed to set up in a parking lot on the Arizona side of the dam, security was tight at the event. U.S. 93 was shut down from noon Monday until after midnight this morning, and guests were bused down to the dam from a staging area about two miles away.

Although security concerns at Bureau of Reclamation projects have moved to the forefront since Sept. 11 the projects themselves continue to run in much the same way they have for most of the last century.

In July 1902, Interior Secretary Ethan Allen Hitchcock established the United States Reclamation Service within the U.S. Geological Survey, to study potential water development projects in Western states. In 1907 the service was separated from the Geological Survey, and an independent bureau was established under the Department of the Interior.

Congress authorized Hoover Dam, then known as Boulder Canyon Dam, to be built in 1928 marking the start of the heyday of reclamation construction of water facilities that occurred during the Depression and the 35 years after World War II.

The Bureau of Reclamation spent about \$200,000 for the event, and Water for the West, a non-profit organization of water users and businesses created for the celebration, spent \$400,000.

The Bureau of Reclamation's bill went mostly toward security and also included the loss in power caused by the need to shut down some generators Monday while guests ate a dinner of beef brisket and Caesar salad in the dam's two powerhouses.

Some of those in attendance were invited guests and others had contributed \$5,000 toward the celebration.

The Associated Press contributed to this story.

Bureau hailed for building West
By Donna Kemp Spangler

Deseret News

HOOVER DAM, Nev. — It's a cliché as old as cowboy boots, but water is and always has been the lifeblood of the West.

And with the help of engineering marvels that tamed the wild rivers with massive concrete dams holding back sprawling reservoirs it is now possible to quench the thirst of tens of millions of people who now call the desert home.

"Tonight we celebrate a milestone, a century of progress, a century of making the arid West bloom," said Secretary of Interior Gale Norton, who arrived here Monday evening to celebrate the 100-year anniversary of the Reclamation Act and its offspring, the Bureau of Reclamation.

Without the more than 600 dams built by the dam-building agency, "Would Las Vegas, Boise, Salt Lake City, Spokane and Phoenix be cities or simply trading posts?" she asked.

Hundreds of bureau supporters were on hand with a resounding endorsement of the obvious: The West would look nothing like it does today without the Bureau of Reclamation.

"The West has literally grown up around reclamation projects, the farms, the cities, the way of life; all were made possible with reclamation's help," said John W. Keys III, commissioner of the Bureau of Reclamation and a Moab resident. "Look at all the great cities out here in the West. All were built around reclamation projects."

Hoover Dam, built in the 1930s and considered one of the nation's greatest engineering feats, draws 1.2 million tourists annually and provides drinking water, electricity and recreation to 23 million people in the Southwest.

Monday's celebration was a chance for the agency — much maligned by its environmental critics — to pat itself on the back for a job well done.

Every year, the bureau delivers 10 trillion gallons of drinking water to 31 million homes, electrical power to 3.5 million homes. The historic problem of river flooding has become

almost nonexistent, 10 million acres of farmland is now irrigated and playground wonderlands have sprung up around reservoirs like Lake Powell.

"These efforts strengthen the nation's economy, ensure the effective use of limited resources, benefit fish and wildlife, and contribute to outdoor recreation opportunities," said President Bush in a message delivered to the Hoover Dam gathering attended by dignitaries from around the West.

But for the few conservationists protesting outside the event there was nothing to celebrate about the bureau's 100-year legacy of environmental degradation, extinct species and wild rivers stunted by concrete.

The flood control that benefits farmers has destroyed the natural ecosystem that thrives on the seasonal ups and downs of the rivers now blocked by concrete dams, they say. "We're not faulting the individuals who made decisions back then," said Owen Lammers, executive director of the Moab-based Living Rivers, which has an agenda to pull the plug on dams. "They did the best with what they knew at the time."

But it is time, he said, for the bureau to become one of restoration and healing.

Living Rivers is one of more than 80 environmental groups that pledged support for a series of protests along the Colorado River in Utah and Arizona leading up to Monday's event. Fewer than a dozen protesters were on hand at Hoover Dam.

Lammers believes the Bureau of Reclamation could apply the same creative genius that built Hoover Dam and Glen Canyon Dam toward correcting the problems created in the past 100 years. Only then it could achieve that elusive balance between the needs of humans and healthy river ecosystems.

The Sierra Club, meanwhile, is pledging to help the Bureau of Reclamation transform itself into agency that fixes the damage it has caused.

"The bureau must include among its primary goals the restoration of rivers, streams and riparian habitat to conditions that enable native fish and wildlife to flourish and thereby ensure that the needs of the natural environment and the human population will be served," the Sierra Club said in a prepared statement.

Department of Interior officials defended the bureau's environmental record, pointing out a series of cooperative projects to restore river corridors and riparian areas.

"The bureau has certainly become environmentally sensitive," Norton told the Deseret News. "There's lots of innovative things being done."

Norton and Keys both agreed the bureau's next 100 years will not be focused on building new dams but on using the water more efficiently, while developing new, environmentally sound water supplies in the process.

Officials party while the flannel-mouthed sucker dies

By David Hare

Las Vegas City Life

Depending on who you ask, the Bureau of Reclamation's June 17 centennial birthday party was either a celebration of man's taming of the Western water supply, or a gathering of inept, contemptible bureaucrats who threw themselves a \$600,000 shindig at the expense and inconvenience of the public.

As the bureaucrats partied, a caravan of protesters led by Living Rivers, a group of Phoenix-based environmentalists, gathered nearby on the Arizona side of the Hoover Dam. The group wanted to draw attention to what they claim is the bureau's 100-year track record of ruining what it was designed to protect: water supplies in the American West.

"[The Bureau of Reclamation] throws this hellacious, expensive party after 100 years of destroying rivers and habitats all through the Colorado River Basin," said Lisa Force, a spokeswoman for Living Rivers.

So that explains the roadblocks being set up on Hoover Dam in the middle of the day.

Force and other representatives of the 88 environmental groups at the demonstration are angry at BuRec officials for the "devastating" amount of damage done to ecosystems allegedly caused by the 600 dams the bureau has constructed in the West.

In particular, the protesters are up in arms over the Glen Canyon Dam, about 370 miles upstream of Hoover. Among BuRec's 600 dams, Glen Canyon is the worst, according to Living Rivers.

"The Glen Canyon Dam is causing the death of the Grand Canyon's ecosystem," said Owen Lammers, executive director of Living Rivers, who claimed that 95 percent of the sediments and nutrients the Grand Canyon ecosystem depends on are being choked off by the dam.

Since the 1960s, he said, the dam has changed the Colorado River's natural flows, its seasonal variations in water temperature, sediment and nutrient deposition, and fish migration into and out of the Grand Canyon.

For example, the dam releases water at a constant temperature of 48 degrees, where natural flow conditions at this time of year would be around 80 degrees. Fish can't spawn in such chilly waters and, thus, Lammers said at least four species of fish have already been lost.

And, according to Lammers, we're about to lose two more fish species - the humpback chub and the flannel-mouthed sucker. Populations of these two fish have decreased dramatically in the last few years, he said.

So that explains the two girls who were dancing in the parking lot while dressed in fish costumes.

Moreover, Lammers said the federal government mandated about 10 years ago that BuRec correct the damage caused to the Grand Canyon ecosystem, but to no avail.

Instead, he said BuRec has merely "tinkered" at fixing the river flow problems.

Not so, said Doug Hendrix, acting public affairs officer at the BuRec office in Salt Lake City.

"Our view is that we're working with our stake holders, such as the U.S. Fish and Wildlife Service, through a number of programs designed to recreate the rivers' natural flow as it goes through the Grand Canyon," he said.

Hendrix then admitted to being on the job for only four months and said he felt uncomfortable commenting any further.

His superior, Barry Wirth, was out of the office for several days.

On the other hand, Robert Walsh, external affairs officer at the Las Vegas BuRec office, was available to comment on the centennial celebration's hefty price tag: "Close to \$600,000," he said.

Of that amount, about \$400,000 was donated by the nonprofit Water for the West Foundation and was spent on fireworks, laser beams and other party favors, Walsh said. The rest of the money - used for "security costs for protection of the dam and its surrounding facilities," among other expenses, Walsh said - was billed to American taxpayers.

The public, however, was not invited to the gala celebration, as traffic was diverted from Hoover Dam for the duration of the ceremony, which lasted about 10 hours.

Among the invited guests were Interior Secretary Gale Norton, BuRec Commissioner John Keys and Nevada Gov. Kenny Guinn.

It's been reported that Norton and company thought the centennial celebration was neat.

Tell that to the humpback chub and the flannel-mouthed sucker.

LR in the News 06/20/02

From AP to NPR, Sedimental Journey's Message Gets Out

From June 13-17, Living Rivers led a caravan of activists in a [Sediment-al Journey](#) to Hoover Dam to protest the 100th anniversary of the Bureau of Reclamation (BuRec). Our objective was to raise public awareness of the problems caused by BuRec's

century of dam building, especially pertaining to [Grand Canyon National Park](#) just below Glen Canyon Dam. We succeeded. Wide-spread media coverage resulted, especially in Arizona, Nevada and Utah. John Keys, BuRec's commissioner, was forced to address the problems associated with Glen Canyon Dam as one of the major criticisms of his agency. Although Keys continued his efforts to mislead the public regarding Glen Canyon Dam's future, the growing public awareness aided by BuRec's centennial will soon force him to abandon such public relations foolishness.

The [network of groups](#) supporting the call for immediate BuRec action on Grand Canyon and Glen Canyon Dam now stands at 85, and will continue to grow. The events at Hoover Dam and along our five-day, 700-mile journey had widespread participation including former Grand Canyon National Park and Bureau of Reclamation employees, representatives of a number of Native American tribes, and a host of environmental groups including the Sierra Club and Friends of the Earth. Whereas the remote location of these events restricted turnout, the media coverage more than made up for it.

We also succeeded in transporting much-needed sediment to the Grand Canyon. Our dump truck, which was filled with sediment at the beginning of the journey near Moab, was unloaded into the Grand Canyon five days later. While our one-ton contribution may have been tiny in comparison to the 100 million tons Glen Canyon Dam takes from Grand Canyon annually, it was nonetheless representative of the commitment by a growing number of constituencies to get all this sediment back permanently.

Here's a sampling of the coverage:

Wildfire is only one face of Colorado drought

By ROBERT WELLER Associated Press Writer

CENTER, Colo.- With only seven inches of precipitation a year, the San Luis Valley is a desert, but it's a water-rich desert.

Experts at milking water from the earth, farmers can grow potatoes right next to the Great Sand Dunes National Monument.

After the driest nine months in a century, matched by unceasing high winds that dry what little moisture is left, even miserly water users may have met their equal.

"It's kind of a cruel trick of nature that our best efforts are getting shot down pretty hard this summer," said Ray Wright, who farms potatoes in the valley.

On Colorado's Great Plains, about 200 miles to the east, Brad Ivey is trying to raise winter wheat, sunflowers and milo in the same winds that have already blown across Wright's valley.

"The winds blow every day. We have not had a day all spring that the wind hasn't blown. It sucks the little bit of moisture you get right out of the ground," Ivey said.

At the end of May, not one of Colorado's 241 water monitoring stations had reached the average rainfall for the period. More than 200 had less than 70 percent and 107 less than 50 percent.

Colorado farmers have seen their winter wheat crop fail. Ranchers are slaughtering cattle because there is no hay. Cities are imposing mandatory water restrictions. And wildfires have already burned more than 346,000 acres.

Most years, the same 14,000-foot mountains that ring the 7,600-high San Luis Valley, about 150 miles southwest of Denver, trap the sand blowing across the valley floor and deliver plenty of water when the snow melts each spring and summer.

Water from snowmelt-charged rivers was diverted into irrigation ditches, the general practice in the West, to water fields. Much of it was lost to evaporation in the process.

Then the biggest valley farms switched to center-pivot sprinkler systems, drawing from wells that tapped into the valley's aquifer. Water coming down the steep mountainsides is trapped between volcanic sediment and clay in two aquifers, one only 50 feet below the surface at some points.

The well-drawn sprinklers, which circle the irrigated area on metal poles, use less than half the water of conventional irrigation.

Now the irrigation ditches are used to recharge the aquifer. Water is pumped into them and allowed to settle into the ground.

"If you can store water below ground, it doesn't evaporate," said Nolan Doesken, assistant state climatologist.

San Luis Valley folks know the value of the water below.

They rose up with bake sales, pie auctions and kiss-a-pig auctions to fight a developer who spent \$1 million trying to get a referendum passed that would allow him to sell aquifer water to Denver's booming suburbs.

But it's harder to fight Mother Nature. Doesken wrote a report in 1999 warning that after the wettest string of years since the Dust Bowl days, Colorado was due for a drought.

After all, much of the West is semiarid or desert. The first military expedition to the Rocky Mountains returned east to advise that it had encountered "The Great American Desert."

"Ninety-seven percent of the time it doesn't rain. You only have to change that to 97.5 percent and you have a drought," said Doesken.

"If you look at the meteorological activity over the last 100 years, scientists now believe what we once characterized as drought conditions are actually quite normal," said Owen Lammers, executive director of Living Rivers, a group critical of dam construction in arid areas.

"Civilizations for thousands of years have tried to farm in the West and failed," Lammers said.

"We are starting to see signs of that happening again," he said. "We don't believe you can't grow food out here, but not the way we are doing it. Alfalfa is one of the most water-intensive crops and it is used to feed cattle."

After the Civil War, the federal government gave away land for a transcontinental rail line and the railroads promoted the region as an agricultural paradise. The government created the Bureau of Reclamation in 1902 and promised settlers they would get the water they needed to farm.

Once settlers poured in, hundreds of dams were built to provide irrigation water, much of it generated from the streams fed by the mountains of Colorado.

This year water has been cut off to ranchers in Gunnison County for the first time since a string of dams was built in the 1960s. Water is distributed based on the age of claims, and other users, including a farming area, have held water rights longer than the ranchers.

Cities depend on their own reservoirs. Denver has enough water to get through at least this season, but neighboring Aurora and some other suburbs have already had to impose mandatory water rationing. Last week, Denver imposed mandatory water restrictions.

In the last two decades, Colorado's population increased by 50 percent. Many farmers and ranchers sold their water rights to cities, which may have prevented more water shortages in suburbs.

Clouding the water are agreements that share Colorado's water with 10 states and Mexico. Wildlife agencies also insist that streams be maintained in some areas to protect aquatic life.

"The last time the San Luis Valley aquifer was seriously depleted, after a 1977 drought, it took five years to replenish it," said Wright.

"Our aquifer is just another reservoir. You have to put more in than you take out. If you mine water there, it is only a matter of time until it is played out.

"I am concerned that by the end of the summer many areas of the valley will see seriously declining water tables. I know there are going to be areas where there isn't sufficient water to finish a crop," said Wright.

Stop the Death Sentence for the Colorado River in Grand Canyon National Park

COMMENTS NEEDED BY NOVEMBER 1, 2002!

Grand Canyon National Park is undertaking the development of a management plan for the Colorado River throughout its boundaries. This 240-mile wilderness caliber river corridor has been devastated by the [impacts of Glen Canyon Dam](#). All native insect species are gone, as are four of eight native fish, otters, muskrats, and the native vegetation in high water zones. Despite this decline, NPS claims it will only address issues of Glen Canyon Dam that affect recreation, giving little consideration to the river's ecology. So they need to hear from you.

Furthermore, this river wilderness has been transformed into a floating, motorized cash register for commercial river companies. Commercial operators are granted 80% of the access for those who can afford to pay, while the general public must wait twenty years to self-guide a trip through the Canyon.

Your input is urgently needed to remedy these and a number of other problems plaguing this artery of one of the world's most famous parks.

The National Park Service will be accepting written comments from the public through September 15, 2002, to help frame the scope of this new Colorado River Management Plan. They will also host public meetings in Salt Lake City, Denver, Phoenix, Flagstaff, and Las Vegas.

With these comments in hand, the Park Service will then spend the next 18 months developing a plan that will be presented in a draft environmental impact statement. However, without a strong voice from the public now, the Park Service will ignore these critical issues and embark on a pre-determined course to leave things much the way they are.

As Mr. Rob Elliott of American Outdoors and Arizona Rafting Adventures has stated to Congress, a regulated river experience is more important than Grand Canyon's native ecosystem. "Recreationally, the difference comes in the sediments and water temperature. Pre dam, or post draining Lake Powell, the water temperature in August would be 80 degrees and 10% of it would be mud. There would be lots of flies, no way to get clean, and no cold water to help perishable foods make it through the canyon for two weeks. Not a pretty picture. As an environmentalist and river runner who regards Grand Canyon as home, I and my customers rather like the river environment and species diversity which has evolved downstream from the dam the way it is today."

Such sentiment appears consistent with a new effort known as ["Firewalk."](#) By not challenging the significant problems caused by Glen Canyon Dam, by not fighting against the use of motors which violates the Wilderness Act, nor by demanding significant reductions in commercial permit allocations to accommodate those who desire a self-guided river running experiences, the Firewalk group is working to ensure

the Park Service promotes little change such that the commercialization of the river continues to flourish while its ecosystem continues to perish.

Your help is urgently needed now. There are three ways for you to participate:

1. Download the simple [questionnaire](#) from the National Park Service;
2. Craft your own letter, and
3. Attend one of the five public scoping meetings (dates & locations below).

Regardless of your chosen mode of participation, let the Park Service know that you want a Colorado River Management Plan that will:

1. Bring the Park in compliance with the National Park Service Organic Act by developing a plan to restore the ecological integrity lost to Grand Canyon as a result of the operations of Glen Canyon Dam including: restoration of flows, sediment and natural water temperature; a recovery program for all native species known to exist in the Canyon prior to the operation of Glen Canyon Dam, and the eradication of all alien species that are impacting natives.
2. Comply with the recommendations of the Park's 1977 Wilderness proposal, and manage the river corridor as outlined in the 1964 Wilderness Act. Ensure that all management decisions reflect "minimum requirement" in terms of Park Service and visitor impact as prescribed in the Wilderness Act.
3. Phase out the use of motorized river transport so that all travel occurs at river pace. Motorized transport is unnecessary and inconsistent with the mandate that the river corridor be managed as wilderness.
4. Provide for full partnership with Native American tribes affected by the Plan, including mechanisms to protect and restore sacred sites and opportunities for Tribes to operate any concession services still deemed necessary once the Plan is complete.
5. Provide for an equitable system for individuals to access the river corridor that does not bias against those who cannot afford to buy their way onto a commercial river trip. Encourage the establishment of a waiting list for all people. Once at the top of the list, the permittee can determine how they wish to travel down river, either self-guided or with the assistance of a commercial company.
6. Following its completion, require the development of a "Needs Assessment" for concessionaire services to determine at what level such services need to continue on the river. This assessment must be completed prior to renewing any concessionaire contracts beyond 2005.

About Firewalk

The following is NOT SUPPORTED BY LIVING RIVERS. It is presented here so the public may be better informed on the weak river stewardship and wilderness ethics associated with some of the parties attempting to influence the River Management Plan now being developed for Grand Canyon National Park.

One members of Firewalk has submitted additional information about the group which he asked to be posted. This and Living Rivers response can be found below.

For more information on the Firewalk initiative contact Mark Grisham, Grand Canyon River Outfitters Association, mark@gcroa.org, (928) 556-0669.

Firewalk Guiding Principles

1. In accordance with existing law and policy, the fundamental requirement of the Colorado River Management Plan is the preservation of the Colorado River corridor within the Grand Canyon as an unimpaired natural and cultural area, to the extent possible given the downstream effects of Glen Canyon Dam.
2. The revised Colorado River Management Plan should strengthen and enhance the Grand Canyon river experience as one of North America's premier wild and primitive backcountry river journeys.
3. Because demand for recreational river use substantially exceeds the level necessary to protect the resource and river experience, visitation opportunities in the Colorado River corridor within the Grand Canyon must be rationed and distributed in a sustainable and equitable manner that awards all potential users with a sense of fair treatment in relation to each other.
4. Within resource protection and visitor experience quality parameters, Grand Canyon river trip visitation opportunities should be maximized and equitably distributed to the greatest number of unique participants as practicable, while maintaining a full and diverse range of available trip styles.
5. The Grand Canyon river experience exerts a tremendous draw on potential visitors of all types of backgrounds, from across America and from around the World, including highly proficient and committed outdoor and whitewater

recreationists, to those with no previous experience in the wild, primitive, backcountry environment. Colorado River corridor management and administration must acknowledge, respect, and respond to this wide spectrum of user interest, need, and expectation.

6. Qualifying areas within Grand Canyon National Park deserve wilderness designation. The President should immediately make his recommendation to Congress in this regard. Until Congress acts upon such a recommendation, the National Park Service remains obligated to protect the suitability of all identified qualifying lands. The Colorado River within the Grand Canyon is unique, and provides outstanding visitor opportunities to experience solitude, a primitive and unconfined type of recreation, and natural quiet; therefore, its management should preserve and enhance these opportunities. A reasonable level of motorized use on the river is compatible with the Wilderness Act of 1964 as an established use under Sec. 1133(d)(1), and can be a tool used to enhance visitation, dispersal, and expanded trip opportunities. As technology advancements allow, a transition to low noise or silent, non-polluting propulsion systems suitable for Grand Canyon river operations should be implemented.
7. The revised Colorado River Management Plan should identify present activities that are inconsistent with existing Grand Canyon National Park General Management Plan "Management Objectives" for the Colorado River and establish a strategy, as well as a pragmatic implementation schedule, to mitigate such activities in a manner consistent with other priorities. Creative problem-solving opportunities may exist through active and site specific management techniques, or through adaptive management processes.
8. The Colorado River Management Plan should impose comparable rules, regulations, and policies on all user sectors to the maximum practical extent, without compromising the essential characteristics of each sector.
9. The private permit distribution system should be distinguished by simplicity, practicality, ease of use, and equality of opportunity, so NPS administration is fair, and can provide responsive customer service economically. A multiple path private river trip permit distribution system may assist the goal of achieving the best possible access to the river experience.
10. The Temporal Recreation Opportunity Spectrum, which involves variable seasonal launch scheduling, should remain a part of Colorado River management, in order to provide a variety of visitor experience opportunities.

RRFW Riverwire - GRAND CANYON NEEDS YOU

As you are now aware, the dates and locations for public scoping meetings have been announced. Here are a few issues we hope you will care to write about:

WHO GETS TO GO?

The CRMP revision will specify who gets to go on Grand Canyon river trips in the future. A common argument voiced by river concessionaires is they need the lion's share of river trips to serve America. The majority of concessions trips serve the top 25% of America's income earners. Don't you deserve to go regardless of your ability to pay?

HOW MUCH PUBLIC ACCESS?

This year, as for each of the past 15 years, about 19,000 commercial passengers, 3,000 commercial crew, and 3,000 general public boaters will enjoy the Grand Canyon river experience. Motor-free wilderness management alternatives now under consideration by the National Park Service can increase visitation to the river while adding fairness in access not seen in over 30 years.

HOW LONG IS YOUR VACATION?

Since the Wilderness Act of 1964, river concessionaires have continued to use large, polluting outboard motorized tour boats in mockery of all wilderness areas in our national parks. Today, 3 out of 4 commercial passengers are only offered a 5 night glimpse of 2/3rds of the canyon. A motor-free Colorado River will allow more Americans to experience the entire canyon in 11 to 12 days, at the river's pace. Rowing trips of 6 to 8 days will allow a more intimate experience with part of the canyon.

Look for additional information about the issue and the process coming from River Runners for Wilderness. Please take a few minutes to consider the issues and get involved.

Grand Canyon needs your help to protect it from self-serving commercial interests. Send comments or make them in person at one of the 4 scoping sessions. For more information on these sessions, visit www.nps.gov/grca/crmp

River News 07/05/02

RRFW Riverwire - DO WE NEED RIVER CONCESSIONAIRES?

Do we need river concessionaires in Grand Canyon National Park? Maybe not. What if the 16 concessionaires operating on the Colorado River in Grand Canyon National Park were changed into Incidental Business Permits (IBPs)? This flexible model allows for businesses to offer support services from food packs to consulting to guiding in a very competitive climate to meet the various needs of backcountry wilderness travelers from Boundary Waters to Grand Canyon.

The analogy is in hunting. Once the hunter draws a permit, they can hire a hunting guide. The same applies to GCNP backcountry, where once an individual receives a permit to backpack, they can seek out a guide to accompany them. The guide holds a National Park authorized IBP. GCNP can issue as many IBPs as there are companies thinking they would like to provide services to the market. Such open competition allows the greatest economic good to the regional economy.

WHAT ABOUT VISITORS IN NEED OF ASSISTANCE TO RUN THE RIVER?

Nearly all river travelers use support services, whether it is shuttle services for a non-commercial trip, or a gourmet guided trip on a tour boat. Wouldn't it make more sense to allow folks to contract just for the services they need whether it's a commercial-style trip for a family that is willing to provide and cook their own food, or a noncommercial group that needs only a cook or boatman? There would be an explosion of employment opportunities for experienced river staff and substantially more sales tax dollars in the coffers of northern Arizona.

River concessions have actively blocked park wilderness protection for the last 30 years. Wouldn't it be best to have businesses that support the park's wilderness resource instead of attempt to exclude the river from wilderness protection? The present river concessionaires use their financial and political might to change the course of river management and block much needed reform in the Grand Canyon.

A new river support services paradigm could be a reality with YOUR HELP. Please take a few minutes to consider the issues and get involved. Protect Grand Canyon from entrenched commercial interests. Letter to LR 07/11/02

from Earl Perry of Firewalk

"Such sentiment is consistent with a new effort known as "Firewalk." By not challenging the significant problems caused by Glen Canyon Dam, by not fighting against the use of motors which violates the Wilderness Act, nor by demanding significant reductions in commercial permit allocations to accommodate those who desire a self-guided river running experiences, the Firewalk group is working with the Park Service to promote little change so that the commercialization of the river continues to flourish while its ecosystem continues to perish." [From: Living Rivers Action Alert, July 3, 2002"](#)

To: John Weisheit, Living Rivers

You have not gotten this right, and I expect you to promulgate the note which follows:

Firewalk convened to see if people of good will on all sides of the issue could agree on steps that would provide private boaters with more access to the Grand Canyon, while improving both ecological and sociological aspects of the river experience in Grand Canyon. Some members of the working group are outfitters, some members of Grand Canyon Private Boaters, some members of Grand Canyon River Guides, and some of us wear many hats.

1. As a group we are not taking a position on Glen Canyon Dam. As individuals, some of us have been working on the Glen Canyon Dam issue since long before you ran the first of your hundreds of 1-day sport-boat motor trips through Cataract and on Lake Powell. We will continue to do so, as individuals. I would also note that as a group we are not taking positions on freeing Tibet, world hunger, or Animal Rights. Increasing non-commercial access, bringing fairness to the system, without violating the preservation mandate of the Park Service, is the job we set ourselves.
2. You can certainly argue that the use of motors violates the spirit of a wilderness, but it does not violate the Wilderness Act. See section 4(A)1(d)(1) "Within wilderness areas designated by this Act the use of aircraft or motorboats, where these uses have already become established, may be permitted to continue

subject to such restrictions as the Secretary of Agriculture deems desirable." Why do you think the Middle Fork has so many lodges, the Selway airstrips, the Salmon jetboats? The law clearly provides that conflicting uses can be grandfathered in. Motor use in Grand Canyon predates the Wilderness Act. Congress will choose whether or not to continue motor use, if it acts on a wilderness designation. If you don't like it, bitch where it counts -- your Congressional delegation. You may win this one based on values, but you are not going to win it based on the law as it is currently written.

3. The working group is not "demanding significant reductions in commercial permit allocations to accommodate those who desire a self-guided river running experiences." It is evaluating a range of scenarios that we obtained by getting the ideas of outfitters, non-commercial boaters, and wilderness advocates. Some of these alternatives involve -- no motors
 - increasing private use at the expense of commercial use
 - increasing private and commercial use
 - equalizing private and commercial use

We are evaluating the effects of increasing/decreasing launches, user days, changing season structures, changing group sizes, and changing/creating alternative user sectors. We will expose fully the consequences of each alternative we examine.

4. We are not working with the Park Service; they are and will be working on their own to produce the plan required by settling the GCPBA lawsuit they asked for. They're aware of what we're doing, and they'll get a copy of anything we produce. At that point our ideas will stand or fall based on whether they embody sound planning and a spirit of temperate fairness. So will yours.

As a working group, we're not going to "demand" anything. We got together to manifest a spirit of reasoned cooperation and dispassionate examination of the widest range of alternatives we could find, to see if we can improve the situation for both sectors.

John, if you are going to function as a reporter, get your facts straight first. Then consider whether you advance a spirit of dialog by trumpeting factoids, falsehoods, and soundbytes.

Earl Perry

Boater 40 years, river guide 8, NPS recreation planner 2, NPS river manager 3, hydrologist 2.

[John's Response to Earl](#)

RRFW Riverwire – DOES ‘FIREWALK’ TALK FOR YOU?

You may be aware that the 16 river concessioners in Grand Canyon formed the Grand Canyon River Outfitters Association (GCROA) several years ago to represent commercial interests in the Colorado River Management Plan planning process. GCROA's paid Executive Director organized a group of selected representatives of interested parties to present an alternative access plan to Grand Canyon National Park Planners. This group is called "Firewalk".

Some of the proposed solutions of FireWalk are:

- Non-commercial boaters will agree to travel on a schedule.
- Trips of 18 to 21 days will be eliminated since they are seen as the cause of campsite crowding.
- A reasonable level of motorized use is compatible with the Wilderness Act.
- Concessions services will give up some user days during peak (summer) months.
- Concessions services will expand commercial use into the shoulder season (spring and fall) to retain their total allocation.

The Wilderness Act clearly states that motors are not allowed in wilderness except in very limited circumstances (i.e. transportation to reach private property), whether its category is "proposed/study", "recommended", "potential" or "designated". Stay tuned to future Riverwires for more on the Wilderness Act.

You might be interested in Firewalk's participant list. They are:

- Mark Grisham, Executive Director, Grand Canyon River Outfitters Association
- Les Hibbert, Wilderness River Adventures
- Richard Quartaroli, President, Grand Canyon River Guides
- Drifter Smith, Board of Directors, Grand Canyon River Guides
- Jason Robertson, Access Director American Whitewater & Board Member, Grand Canyon Private Boaters Association,
- Richard Martin, President, Grand Canyon Private Boaters Association
- Destry Jarvis, Retired National Park Service
- Tom Robison, Director of Government Affairs, Grand Canyon Trust
- Earl Perry, non-commercial boater, retired River Ranger
- Ben Harding, non-commercial boater, river activist
- Jeffery Cross, Science Center Director, Grand Canyon National Park
- Linda Jalbert, Recreation Planner, Grand Canyon National Park.

Is your voice represented here, or do you feel non-commercial boaters have given up too much access and wilderness protection already? Firewalk's scenario could be a reality without YOUR HELP. Please take a few minutes to consider the issues and get

involved. Grand Canyon needs your help to protect it from self-serving commercial interests seeking to hurry up your Grand Canyon experience. Your comments are accepted through September 20, 2002. You can send comments or make them in person at one of the 4 scoping sessions.

LR Letter 07/12/02

Response to Earl Perry

Hi Earl,

I appreciate your [letter](#). It was not our intent to anger you. Our intent is to advocate for ecological integrity of the Colorado River. Here is what the CRMP of 1989 states as its first goal.

"To preserve the natural resources and environmental processes of the Colorado River corridor and the associated riparian and river environment."

It is really too bad that the Park Service has decided to take a backward step in this regard. What I, and others, see is an RMP that is being driven by human recreation issues. It is fine for recreation to be a component of the RMP, but not when it excludes biological integrity.

I am involved with Colorado River issues because a world class ecosystem is about to collapse. I see the potential for the ecosystem to be destroyed by an upstream dam built in Navajo sandstone. I will not be accountable for the continuation of a river management scheme that dismisses biological impairment. Four of eight native fish are already gone and two more are on their way; native insects are gone...you know how bad it is. The Organic Act compels the Park Service to act. It's not and so I will. The river must come first, our recreation on it second. I'm pleased that a growing number of river runners are joining me in adopting such an ethic.

Furthermore, the dam does tie into recreation issues too. This pertains to the sediment problems related to the reservoir arms at San Juan and Cataract Canyons. It's a mess out there now, creating huge problems for private and commercials alike. Such problems won't be addressed by GCNP as they are in GCNRA's basket, but they should be part of a greater boating community voice for a natural and free flowing Colorado through Cataract, San Juan, Glen an Grand Canyons.

As regards to Dave Brower (during our phone conversation). His stamp on the betterment of this planet is sound regardless of the Glen Canyon fiasco. Hindsight is 20/20. This is no single-minded issue, other than those who choose to focus on trying to get the old pretty pictures back. It's about the restoration of the most developed river in the world. It's about the tremendous waste of water and energy resources. It's getting water back to Mexico, and yes, it's also about saving the Grand Canyon. I don't care if I take another Grand Canyon River trip, but I do care if we continue to lose its native ecosystem. Others here have never even been down it, and are fighting just as hard to put the ecosystem first. Glen Canyon Dam is a key part of this, and must be addressed by the management plan. I hope you will join us in the call.

John

LR in the News 07/14/02

In Drought-Parched Arizona, Some Areas Drink Deeply

By MICHAEL JANOFISKY for New York Times

PHOENIX, July 11 -- This should be the so-called monsoon season here, when moist Pacific air brings afternoon thundershowers. But only a trace of rain has fallen since Arizona's devastating wildfires were finally contained last week, providing little relief from a statewide drought now entering a fourth year.

The lack of rain and snow has depleted ponds and reservoirs, parched ground cover, killed herds of livestock and cost hundreds of millions of dollars in agricultural revenue. The Bush administration recently declared Arizona a drought disaster area, making many farmers and ranchers eligible for low-interest loans and other aid.

"People out in the fields and people in the high country all tell me the same thing," said Ken Evans, president of the Arizona Farm Bureau, an organization of 15,000 members. "This is the worst drought in Arizona since the white man came here," hundreds of years ago.

But in a desert state that relies on its federally mandated water allotment from the Colorado River to support its rapid growth, a drought does not mean water shortages everywhere.

While ranchers in many areas are selling thousands of animals to prevent death by dehydration and some rural counties are having water trucked in, residents of Phoenix and Tucson, the state's largest cities, are free to wash their cars, soak their lawns and fill their swimming pools.

Indeed, only a few communities, like Flagstaff and Pine, have any water restrictions. Most everywhere else, water parks are open and new residential and golf course developments are forging ahead on schedule. Irrigation flows uninterrupted to alfalfa, citrus, cotton and vegetable crops in Yuma County and elsewhere. In fact, these are boom times for alfalfa growers. With grazing lands parched, cattle ranchers have been forced to buy stockpiles of feed for their hungry animals.

The reason for such disparity is the way water is delivered. The largest source is the Colorado River, which supplies Phoenix and other communities as well as farmers. Other places draw from less reliable sources -- ground water, which is available everywhere in varying amounts, and lakes and reservoirs.

The steady flow of the Colorado, which also supplies water to six other states and Mexico through contracts first negotiated in 1922, virtually assures Phoenix and Tucson all the water they need. Those two cities get 53 percent of the Colorado River water flowing into the state.

Developers say abundant water in metropolitan Phoenix is a major reason Arizona has become one of the fastest-growing states.

"In the 1960's, 80 percent of water in the state was used for agriculture, and 20 percent for residents and businesses," said John Sullivan, a senior official with the Salt River Project, which manages water into the Phoenix area from the Salt and Verde Rivers. "Now, it's 80-20 the other way. Water is there for growth."

Environmentalists argue that such a strategy might only prolong droughts.

"The development industry is not inclined to educate citizens about water conservation because it actually doesn't use all the allotment it has and worries that if it doesn't use it now, it won't have it in the future," said David Hogan, spokesman for the Center for Biological Diversity, a Tucson environmental group.

For Mr. Hogan, and free-market conservatives, the subsidized water used by farmers is more offensive, especially for cotton, which he called "grossly water intensive, especially for a crop that receives massive subsidies in other parts of the country."

Stephen Moore, president of the Club for Growth, a pro-market political action committee in Washington, said removal of subsidies, allowing the price of water to rise, would eliminate shortages and be "the best way to encourage conservation."

In any case, conservationists say officials in drought-prone states are doing too little to prevent shortages. Lisa Force, program director for Living Rivers, a Western nonprofit group that works to restore waterways, said recent low-rainfall years in the Southwest may now be the norm, not aberrations, and states need to adapt. Arizona officials, she

said, "totally have their heads buried in the sand." In neighboring New Mexico, for example, which is entitled to only a small share of water from the Colorado River projects, water restrictions are widespread.

For now, Arizona officials say any argument over surplus and need cannot be resolved by the current water network. Don Lavelle, a spokesman for the State Department of Water Resources, said even if there were restrictions in Phoenix and other cities, the water saved could not be diverted to other arid areas, because no canals or pipelines have been built to reach them.

Droughts will always harm areas that depend more on ground water and runoff, he said. That is the case now, with rainfall at 10 percent of normal statewide and lakes and reservoirs well below 30-year averages.

"Some towns are always on the edge with water problems because of their location," Mr. Lavelle said, describing conditions that are even worse across the northern tier of Arizona, where underground geologic fractures make water tables less dependable even in the best of times.

Those areas have been affected the most by drought, the brunt of it borne by cattle ranchers, who make up about 40 percent of the state's annual \$6 billion to \$7 billion agriculture industry.

As grazing lands dry up, cattlemen are selling animals to out-of-state buyers or surrendering them to slaughterhouses at bargain prices. A recent survey by the Arizona Cattlemen's Association found that the drought depleted the cattle stock over all by about 20 percent since 1996, a loss of about 60,000 animals. State officials predict that an additional 47,000 animals will be lost this year.

As residents of northeast Arizona, Navajo Indians have also been hurt by the drought.

Alex DiNatale, the Navajo Nation hydrologist, said most of the reservation's 7,500 ponds have dried up, deep-water aquifers are empty and as many as 10,000 animals have died this year from dehydration, malnutrition and auto accidents that occur when animals eat roadside plants. Navajos have begun selling animals to auction houses.

One sheep, Mr. DiNatale said, might normally sell for \$85, but some herders are selling sheep now for \$7.50. "And that's a good option," he said.

Wildlife is suffering, too. Brian Wakeling, the big game management supervisor for the state Department of Game and Fish, said alarming numbers of wildlife are unable to survive the first few months of life. Survival rates for prong-horned antelope, normally up to 40 percent of those born, are under 10 percent in some parts of the state. The rate for elk, normally 40 to 50 percent, has fallen below 20 percent.

A land-management group, the Diablo Trust, has begun hauling hundreds of thousands of gallons of water into areas around Flagstaff to save as many animals as possible.

"We've never seen anything like this," said Mandy Metzger, the trust's director. "Every time we dump a load of water, 100 to 200 elk show up. It's a tinderbox out there."

Watering down Valley's lifestyle

The Arizona Republic

Go to an Arizona Diamondbacks game this summer and you might spot D-Baxter, the team's mascot, tossing you a T-shirt emblazoned with messages about using water wisely.

If you have kids in school, chances are at least one will bring home a brochure or a door hanger that offers creative ways to save water around the house.

And don't be surprised if you're strolling through Gilbert and you find yourself face to face with a giant blue latex water drop handing out blue fortune cookies filled with exhortations like: "Be in the know, save H₂O."

What you won't find are the kind of mandatory water restrictions being imposed in other drought-stricken Western cities.

Even as runoff-starved reservoirs northeast of Phoenix fall to nearly record levels, triggering a Stage 1 drought based on a regional management plan adopted six years ago, Valley cities have decided not to require water conservation this year. Instead, they have opted to turn up the volume on informational programs already in place.

"We're in better positions to ride out a drought than most big cities," said Tom Babcock, chief water resource specialist for the city of Phoenix. "We're accustomed to not getting a lot of rainfall and the state has invested heavily in projects to impound water and then deliver it."

But while the Valley faces no immediate shortages - the canal importing water from the Colorado River is full and underground supplies are adequate for communities that rely on them - some people who monitor water use say cities need to consider the longer view, especially in a fast-growing desert prone to droughts.

"Major metropolitan areas don't think they need to worry about water," said David Bainbridge, coordinator of the environmental studies program at Alliant International University in San Diego. "They think there's plenty more they can take. But that does nothing to create a sustainable supply."

Lisa Force, Arizona program director for Living Rivers, said evidence is mounting that the region could be entering a prolonged dry spell, one that would leave the Southwest with less water for years to come.

The Colorado River, which offers metropolitan Phoenix a comfortable buffer from dry years, is running this summer at its second-lowest level on record.

If the drought persists through the fall and winter, some cities will face tough decisions next year. Salt River Project, whose reservoirs on the Salt and Verde rivers have been hard-hit by the lack of mountain snow, will decide in September whether to reduce allocations to its customers.

That could mean higher rates as providers turn to the more expensive water from the Central Arizona Project.

Meanwhile, Valley cities have adopted a nearly unanimous approach to water use: Preach conservation as a lifestyle, year in and year out and teach people to manage their water carefully whether there's a drought or a flood.

At the core is the "Water: Use It Wisely" advertising campaign, which started in Mesa and has expanded to include nearly a dozen communities.

"We were all sending out our own different messages before," said Karen Warner, a water conservation specialist for Scottsdale. "So we decided we need to send out the same message. It makes sense to unify."

Cities also develop their own programs. Among them:

- School programs, aimed at instilling a conservation ethic at an early age, one that kids can pass along to their parents. Avondale uses magic in its show to keep kids interested.
- Water audits, in which homeowners can learn how much water they use and how they can use it more efficiently. Scottsdale will attach a monitor to water meters if the residents ask and show them exactly where their water goes.
- Publicity campaigns, such as Gilbert's, which includes the giant water drop and the fortune cookies. The water drop, actually town employee Lisa Hemphill, has proved popular so far.
- Rebates for installing desert landscaping or low-water-use plumbing fixtures. Although many cities offer such rewards, Phoenix passed because they weren't cost-effective, Babcock said.

David Mansfield, Scottsdale's water resource manager, said his city and others have accomplished a lot without forcing residents to change their lifestyle. Raising awareness is an important first step.

"We've never had to go to a restricted- water-use environment," Mansfield said. "We don't see that as a necessity for our community. That doesn't mean we can't ever get there; this winter is an important winter for all of us."

Phoenix recently adopted a revised drought plan that would be triggered if conditions worsen and other cities are working to create similar plans. The goal, said Esmie Avila, a water resource analyst for Avondale, is to establish consistent drought measures so all of the cities can coordinate their response.

"We're not absolutely sure we need to do drought response," Babcock said, "but we want to be there so the city is leading instead of following. We're making all the preparations even while we're crossing our fingers we won't get there."

Grand Canyon native fish to launch Habitat Security Tour in Denver Demanding National Park Service action to restore Colorado River

Contact:

Lisa Force: Living Rivers Denver Office, 303-237-2269/602-321-1753 mobile

Owen Lammers: Living Rivers Utah Office, 435-259-1063/435-260-2590 mobile

Endangered fish frustrated with the devastation of Grand Canyon's native ecosystem will participate in a National Park Service-sponsored public meeting on Thursday, August 1, 2002, 4:00-8:00 p.m., Community College of Denver Downtown Campus, Tivoli Student Union Conference Center, 900 Auraria Parkway (see below for more information). They will be demanding that the new Colorado River Management Plan now being developed by the Park Service make the security of their habitat its primary objective.

It's appalling that the National Park Service has ignored its principle responsibility to protect the natural integrity of this world renowned river corridor," says Lisa Force, program director for Living Rivers in Denver. "The Park Service has allowed Grand Canyon's entire food base to be altered, causing the loss of all native insect species, elimination of half the native fish species and the disappearance of mammals such as otters and muskrats."

Force and representatives of other environmental groups will be dressed as Grand Canyon native fish during the Denver meeting, and speak on behalf of the habitat loss these fish have experienced. Living Rivers will then take this habitat security message on the road to four other Park Service meetings on Grand Canyon taking place in Salt Lake City, Flagstaff, Las Vegas and Phoenix later in the month.

Fish which have gone extinct in Grand Canyon include the razorback sucker, bonytail chub, roundtail chub and Colorado pikeminnow. The humpback chub and flannelmouth sucker are in serious decline, as may also be the case for the bluehead sucker. The only Grand Canyon native fish believed to be surviving with sufficient numbers is the speckled dace.

"The Park Service has forgotten its mission, concentrating primarily on managing people while the habitat and native species these people come to visit disappear," says Ed Dobson, a Sierra Club board member. "Ever since the operation of Glen Canyon Dam upstream of Grand Canyon, Grand Canyon's river habit has been experiencing a long, slow death."

This decline is occurring because

- ninety five percent of the sediment and nutrients that once flowed into Grand Canyon is now trapped behind Glen Canyon Dam;
- seasonal flow fluctuations critical for building beaches and spawning habitat no longer occurs, and
- water released from the dam is nearly a constant 46 degrees F, whereas the native system requires temperatures in excess of 80 degrees.

"Whether impacts to the Canyon's ecological integrity result from activities inside or outside Grand Canyon, the Park Service is obligated by law to address them," adds Dr. Brent Blackwelder, President of Friends of the Earth. "Glen Canyon Dam is the major threat to the health of Grand Canyon, and reversing its impacts must be the core objective of the new river management plan."

Living Rivers, the Sierra Club and Friends of the Earth are part of a growing nationwide network of environmental and social justice groups calling for immediate action by the National Park Service and the Bureau of Reclamation, which operates Glen Canyon Dam, to reverse the ecological decline in Grand Canyon. Specifically these 85 groups are calling for:

- The restoration of natural sediment and nutrient flows from the main stem Colorado into Grand Canyon.
- The restoration of natural flow regimes to properly transport this sediment within Grand Canyon, when and where it belongs.
- The restoration of natural seasonally variable water temperatures in the main stem Colorado through Grand Canyon.
- Development of a restoration and recovery program for the Colorado River corridor in Grand Canyon that includes the recovery of all species known to be native to Grand Canyon prior to the operation of Glen Canyon Dam.

####

Directions to Community College of Denver in downtown Denver: From I-25 exit on Auraria Parkway. Auraria Campus is on your left. (Pepsi Sports Center is on your right.) From I-70, exit onto I-25 SOUTH, then exit on Auraria Parkway. Tivoli Student Union has a tall smokestack. Parking for Tivoli Student Union surrounds the building and is \$1.25 per half hour; however if you let them know you are there for the NPS meeting they should validate your parking. For additional information regarding location and parking, call (303) 556-2600. (For those coming from out of town, Aurora is an east suburb of Denver and has nothing to do with Auraria Campus.)

Other stops to include:

Colorado River Management Plan Talking Points

Preserve and protect wilderness character of the Colorado River unimpaired for future use and enjoyment as wilderness.

The NPS asks "What would we choose to have the river be like in the future." Twenty two years ago the Park Service, with overwhelming public support, proposed the Colorado River in Grand Canyon for Wilderness designation. Until Congress acts on the proposal, the agency is required to provide the same level of protection for "proposed wilderness" as congressionally designated wilderness. What should the river be like in the future? *Tell the Park Service the river should be forever Wilderness!*

Park Values

The Park Service again asks, "will natural and cultural resources be in the same condition they are today or will they be different in the future?" Laws applicable to Grand Canyon National Park demand protection of natural and cultural resources. *The agency should protect all of the great Park's intact biological communities, natural process, and archeological treasures.*

The Experience

The Park Service wants to know what river trips should be like. Tell the agency to provide recreational opportunities consistent with the preservation of the river's natural and cultural resources and wilderness character. *Tell them to provide outstanding opportunities for solitude and a primitive recreational experience without the use of motorboats.*

The experience offered should reflect the unique character of the Grand Canyon - our country's longest whitewater wilderness. The roar of a rapid, the quiet trill of a canyon wren, and relaxed conversation, in concert with the river's flow are part and parcel of the wilderness experience. Such tranquility should not drown in clamor of crowds or the racket of an outboard motor.

Who Should Go?

Currently, the general public, citizens who don't need the corporate river outfitters, must wait up to 20 years to obtain a permit to run a river trip on their own. Profit obsessed concessionaires control over 70% of river access and offer expensive river tours generally costing more than Caribbean cruises of comparable length. These pricey trips remain beyond the reach of most Americans, including youth and educational groups.

Tell the National Park Service to reform its current concession services and provide fairer access and affordable trips to include a broader representation of citizens.

Distributing use throughout the seasons would reduce crowding and congestion along the wilderness river. Providing fair and affordable access would not decrease the number of river runners, but it would increase our opportunity to enjoy an experience only the Grand Canyon wilderness can provide. *Tell the Park Service to provide us with a qualitatively better experience, a wilderness experience.*

Motorboats

Motors are generally prohibited in wilderness, as they should be. Motorboats are not as safe as oar-powered craft, nor do they provide economical trips as claimed by some river concessionaires. They simply generate higher profits for the corporations by crowding more people on noisy boats rushing through the Canyon. *Tell the Park Service to remove motors from the river.*

Helicopters

The use of helicopters should be limited to life and health-threatening emergencies, or essential administrative imperatives. Each season over 10,000 recreational passengers fly on or off the river by helicopter, creating a noisy, potentially hazardous carnival atmosphere within the Canyon's wilderness. All of this activity occurs near the base of Whitmore Trail, a mile-long trail offering alternative hiking and mule access the rim. *Tell the Park Service to eliminate noisy, intrusive helicopter passenger exchanges.*

Dam Operation

Glen Canyon Dam, located upstream of Grand Canyon National Park, dramatically impacted the Park's river corridor. Flow release decisions made by the interdisciplinary Adaptive Management Workgroup, ultimately constrained by electric power interests, have not always protected Grand Canyon's natural and cultural values. For example, the populations of endangered species, such as the humpback chub, continue to precipitously decline. The National Park Service must assume greater involvement and responsibility for dam operations. *Tell the Park Service to not pass the buck to agencies with less preservation conscience "for their consideration."*

Glen Canyon Dam in spotlight as NPS revises Grand Canyon plan

The Land Letter

Dan Berman

Environmentalists are preparing to push for the restoration of the Colorado River as the National Park Service holds its first public meeting today in Denver on its effort to revamp the environmental impact statement for the Colorado River Management Plan for Grand Canyon National Park.

NPS must complete the EIS by the end of 2004, and environmentalists are hoping it will address the perilous state of the Colorado River, especially the impact of Glen Canyon Dam, which is blocking nearly 95 percent of sediment and nutrients that formerly flowed down the river into the Grand Canyon.

"They need to address the ecological integrity of the river, and what the river needs right now is its sediment back," said Owen Lammers, executive director of Living Rivers.

Environmentalists say the dam is devastating the river and the Grand Canyon. Aside from the sediment issue, the water from the dam is released at 46 degrees Fahrenheit and does not reach the 80 degree level needed to maintain the habitat. This means native fish species like the humpback chub are harmed in favor of non-native species, environmental groups say.

"The Park Service has forgotten its mission, concentrating primarily on managing people while the habitat and native species these people come to visit disappear," said Ed Dobson of the Sierra Club. "Ever since the operation of Glen Canyon Dam upstream of Grand Canyon, the Grand Canyon's river habitat has been experiencing a long, slow death."

"The first thing we're looking for is for the park service to realize it needs to take on these issues," Lammers said. As for solutions, Living Rivers supports decommissioning the dam, but Lammers said BuRec could construct a truck bridge to haul sediment out from behind the dam as well as increase water flows from the river on a permanent basis.

As it stands, the Glen Canyon Dam Adaptive Management Work Group, a 25-member consortium of state and federal government agencies, Native American tribes, environmental groups, recreation interests and power companies recommended at its April meeting a test flood from the dam similar to one attempted in 1996.

But Lammers calls the test flow "a waste of time," adding that it will not have any long-term impact on the Colorado River ecosystem. "They can go and introduce a natural flow regime right now," Lammers said. "Doing this for a few hours is not what the system needs. It needs to be done 24-7-365." Lammers added the test flow only serves to give BuRec good publicity. "At least they can say 'were trying,' but the data indicates they've done this before and nothing has happened." Restoring the water flow from the dam to match the water entering Lake Powell is "something they can do tomorrow," Lammers said.

The test flow is subject to approval by Interior Secretary Gale Norton, who is expected to make a decision by the end of August, according to BuRec Spokesman Doug Hendricks.

Over 70 environmental groups signed a petition in June asking BuRec and NPS to restore the Colorado River and the Grand Canyon. "The demise of this canyon, one of the seven natural wonders of the world, symbolizes the unnecessary impacts brought upon rivers throughout the West by BuRec's environmentally and culturally destructive policies designed to optimize water delivery," the declaration said.

The groups called upon the federal government to: restore sediment and nutrient flows into the Grand Canyon, natural flows within the canyon, and more naturally variable water temperatures; develop a restoration and recovery plan for all Grand Canyon species; eradicate alien species that compete or prey on native species in the canyon; and define the Colorado River through the canyon as wilderness, thereby ending the use of personal watercraft.

Additionally, Living Rivers and other environmental groups are "well underway" in preparing legal action against the federal government for failing to address the declining Colorado River ecosystem. "The fact that the scoping process is underway is in no way impeding us from pursuing legal action on this matter," Lammers said.

LR Letter 08/01/02

Colorado River Management Plan: LR Scoping Comments

August 1, 2002

Joseph F. Alston, Superintendent Grand Canyon National Park P.O. Box 129 Grand Canyon, AZ 86023

Dear Superintendent Alston:

Living Rivers appreciates the opportunity to provide scoping comments for the Colorado River Management Plan (CRMP). This is a critical time in the ecological history of Grand Canyon's river corridor. The corridor has experienced extensive changes over the past 40 years, largely as a result of operations at Glen Canyon Dam. Some of these changes are causing potentially irreversible damage to this world-renowned ecosystem. As the National Park Service is the agency with the sole responsibility to protect the river's natural integrity for present and future generations, it is vital that the new CRMP outline strategies to reverse the damage that has been occurring and to restore the river's native habitat, species and natural processes.

The current CRMP, completed in 1989, states as its first goal, "To preserve the natural resources and environmental processes of the Colorado River corridor and the associated riparian and river environment." The Park Service has clearly failed in its efforts to fulfill this goal. The natural resources in the river corridor are now much worse off than before CRMP was developed. The principle fish species the Park Service and other agencies have been working to protect, the humpback chub, has declined more than 75% to just 2000 adult fish. Nothing has been done to address the need to recover

the four native fish that have become extinct in the canyon: razorback sucker, bonytail chub, roundtail chub and Colorado pikeminnow. The Park Service has also been negligent in ensuring that two other species, the flannemouth sucker and bluehead sucker, are not suffering the same fate.

This decline in native fish populations is just one indicator of the extensive ecological damage taking place in Grand Canyon's river corridor which the Park Service is neglecting. The entire food base for the river ecosystem has been dramatically altered. A green alga (cladophora) has displaced the natural carbon food base. None of the river's indigenous aquatic insects exist in the Canyon any longer. Otters and muskrats are now gone from the canyon and native riparian vegetation is disappearing from the high water zones or is stunted due to the lack of nutrients and the invasion of competing non-native plants. Most, if not all, of these changes are a direct result of the operations of Glen Canyon Dam. These changes include:

- * Ninety-five percent of the sediment and nutrients that once flowed into Grand Canyon's riverine ecosystem are now trapped behind Glen Canyon Dam causing the beaches to erode away and the native vegetation to disappear, disrupting the historic food base.
- * Seasonal water temperatures that previously fluctuated from freezing to 80 degrees Fahrenheit, now range from 43 to 55 degrees, eliminating the warm water temperatures necessary to trigger native animal reproduction and fostering non-native fish species at the expense of native species.
- * Natural flows which fluctuated seasonally from 3,000 to 90,000 cubic feet per second now fluctuate only from 8,000 to 20,000, cubic feet per second, creating a near static flow regime for an ecosystem that is adapted to and dependent upon the dynamic pre-dam flow.

These changes represent a significant violation of the National Park Service's Organic Act (1916) which requires that the National Park Service preserve its lands unimpaired for the enjoyment of current and future generations. The lack of any substantive action of late also represents a violation of the intent of the 1992 Grand Canyon Protection Act.

The Organic Act and the establishment of Grand Canyon National Park pre-date the decision to construct Glen Canyon Dam. Whereas numerous alternatives exist to provide for the societal needs associated with Glen Canyon Dam, there are no alternatives to the unique ecosystem that is the river corridor through Grand Canyon National Park. Moreover, the Organic Act compels the Park Service to act even if impacts result from activities taking place outside its boundaries, as is the case with Glen Canyon Dam.

Grand Canyon National Park cannot abdicate to the Adaptive Management Work Group (AMWG) its responsibility for management decisions pertaining to the ecological integrity of the river corridor even when such decisions relate to Glen Canyon Dam outside park boundaries. It is the Park Service's responsibility to uphold the Organic Act, not the responsibility of the Bureau of Reclamation, Western Area Power Administration or any of the other AMWG participants. Furthermore, the AMWG has not demonstrated

an ability to provide any lasting benefits to the Grand Canyon ecosystem. As noted above, AMWG and the Park Service have failed in the principle mission to recover populations of humpback chub at the Little Colorado River. Populations in the Little Colorado River have declined 75% and no gains have been made in the establishment of a second population of humpback chub in the Colorado River mainstem. While the Park Service is fully within its rights to participate in the AMWG, the Park Service alone has the responsibility to ensure the future integrity of Grand Canyon's native river ecosystem.

As guardians of this critical component of world heritage, it is vital that the Park Service through the CRMP address all aspects of river management, especially the impacts to the integrity of the Park's native ecology caused by the operation of Glen Canyon Dam. Specifically, the CRMP must address mechanisms to:

- * Restore essential sediment and nutrient flows from the mainstem Colorado River into Grand Canyon.
- * Restore natural flow regimes to properly transport this sediment within Grand Canyon, when and where the sediment belongs.
- * Restore natural seasonally variable water temperatures in the mainstem Colorado River through Grand Canyon.
- * Develop a restoration and recovery program for the Colorado River corridor in Grand Canyon that includes the full recovery of all species known to be native to Grand Canyon prior to the operation of Glen Canyon Dam.
- * Implement a non-native eradication program to minimize alien species in the Grand Canyon River corridor with a priority on those that prey on, compete with or otherwise impair the health of native plants and animals.

We recognize that there are a variety of issues which the Park Service may be asked to address within the CRMP. However, none can be more important than those which relate directly to the Park Service's mandate as prescribed in the 1916 Organic Act. Without the natural ecological integrity of the river which carved it, Grand Canyon itself loses its integrity as does the Park Service. The principle objective of the new CRMP must be the restoration and recovery of the natural processes and native species to Grand Canyon's river corridor.

Thank you for the opportunity to submit these scoping comments.

Sincerely,

Owen Lammers Executive Director

LR in the News 08/04/02

Critics: Canyon river plan ignores dam

By GARY GHIOTO for Arizona Daily Sun

Opponents of Glen Canyon Dam and supporters of wilderness designation for Grand Canyon National Park are outraged that the National Park Service isn't considering the issues in the revised Colorado River Management Plan.

Sue Gunn of The Wilderness Society says the Park Service is mandated to manage the river as wilderness -- that translates to no outboard motors.

That's because park officials recommended to Congress more than two decades ago that the river and more than 950,000 acres of Grand Canyon National Park be considered a wilderness area.

Though the designation is in legislative limbo, Park Service regulations are clear that until Congress acts, the river must be considered wilderness, Gunn said.

Grand Canyon National Park Superintendent Joseph Alston said no action will be taken on the wilderness designation until Congress acts. He said the river corridor will be managed under current backcountry regulations that protect natural and cultural resources.

"We did agree to look at the issue of motors versus nonmotors and that's sort of central to the whole wilderness issue as it relates to the Colorado River corridor through Grand Canyon," Alston said. "So we will tackle that issue and the outcome of that will, in large part, direct how the river is viewed in terms of wilderness as it relates to the backcountry management plan."

Gunn said that's not enough.

"That's pretty myopic and I think it shortchanges the American people in terms of that experience of being on that river," Gunn responded. "I personally think there is a concerted effort inside the Park Service to eviscerate the wilderness program."

The Wilderness Society, the National Parks Conservation Association and the Arizona Wilderness Coalition were among a dozen conservation groups who recently wrote Park Service Director Fran Mainella and criticized the management plan process.

The groups said holding public meetings in five Southwestern cities is "unfair to the American public" and limits the range of discussion on the pending management plan. Meetings should be scheduled in Los Angeles, San Francisco, Washington, D.C., and New York City, Gunn said.

"The Grand Canyon is a national, an international icon. When you talk about parks ... the average American thinks of the Grand Canyon. I get the feeling this is a skewed setup," Gunn said.

Alston said there is plenty of opportunity for people on the East and West coasts to comment on the plan. Letters and e-mails are being accepted by the Park Service on a special Web site and an extensive mailing list also will solicit comments, he said.

Meanwhile, groups like Living Rivers, which wants Lake Powell drained, and the Flagstaff Activist Network are blasting the Park Service's decision not to consider the environmental impact of Glen Canyon Dam in the management plan.

Owen Lammers, executive director of Living Rivers, said ignoring the consequences of Glen Canyon Dam is a "death sentence" for the river and endangered species like the humpback chub. FAN and Living Rivers says the Park Service must "assume greater involvement and responsibility for dam operations."

Alston said the dam, which is run by the Bureau of Reclamation, is "outside the scope" of the Park Service and the management plan.

"They're choosing the wrong forum. We don't have the discretion to change the operation of the dam or the flow rate of the dam," he said.

Hundreds Float River Ideas

Thursday's Colorado River Management Plan meeting draws a packed house over motors, permit, and wilderness.

By Gary Ghioto for Arizona Daily Sun

Hundreds of Flagstaff-area residents came to Coconino Community College Thursday to speak out on a pending National Park Service plan to manage the Colorado River for the next 20 years.

Grand Canyon National Park officials are trying to determine who should get access to the river, whether motorized rafts and boats should continue to ply the river, and how to divvy up trips between commercial and private boaters.

The crowd featured the full spectrum of the Colorado River community: owners and guides from commercial rafting and boating companies, do-it-yourself river runners, environmentalists and wilderness advocates.

Flagstaff is home to many of the commercial outfitters who carry rafters down the river, and they were out in force to defend their permit allocation and right to use motors. Public comments gathered in Flagstaff and from other sessions in Salt Lake City, Denver, Las Vegas and Mesa will be included in the National Park Service's environmental assessment that will be released in 2004.

"We had a reasonable turnout in Denver, a good turnout in Salt Lake City and this looks like another good turnout," said Joseph F. Alston, superintendent of Grand Canyon National Park, as he fielded questions from people attending the meeting.

Alston said the issues in the meetings have revolved around the allocation of permits for private and commercial boaters, the use of outboard motors on the river and the long waiting list for private permits.

"We've heard a lot and we're giving serious consideration to a lot of good ideas," he said.

National Park Service staff and posters provided detailed information about how permits are issued for the 23,000 private and commercial boaters each year. They also took comments from the public about the fate of motorized travel on the river and the use of helicopters to ferry river runners back and forth to Las Vegas.

19-Year Waiting List

Park officials say the average wait for a private trip is 19 years. The waiting list is an emotion-laden issue between commercial and private boaters. Currently commercial outfitters receive 70 percent of river permits granted by the Park Service.

"I registered in 1990 and my trip came up in 1999. I got on when I was a graduate student and I didn't get my trip until I was a tenured professor," said Willie Odem, past president and current board member of the Grand Canyon Private Boaters Association.

Now Odem, a NAU professor who teaches environmental engineering, is back on the list and faces a 20-year wait.

"Part of the problem I think is that the allocation has to be shifted. But also the Park is the only agency in the country that uses this waiting list system. It's a horrible system to distribute access. It's an abomination," said Odem.

The association favors a 50-50 split of permits with commercial operators and an end to the waiting list by using a reservation system that guarantees a launch date for permit holders.

Mark Grisham, executive director of Grand Canyon River Outfitters Association, which represents the 16 firms that run Colorado River trips, acknowledged that the waiting list is flawed and should be abolished.

But figuring out how to divvy up the percentage of river permits won't be easy, said Grisham.

"Our feeling is that the private boaters community has not developed a compelling case that the current allocation system is wrong or incorrect," he said.

"You should ask them what is the basis that the National Park Service should make this decision? What is the criteria that the Park Service should use to compute the outcome and how is that criteria measured in comparable terms? When you get into that, you learn very quickly that those are very difficult questions to answer," said Grisham.

The outfitters favor a reservation system that sets "reasonable" requirements for permit applicants to follow. River runners should select a date, detail the size of the group going, identify the people in the group and put down a refundable security deposit.

The system discourages people who apply for a permit and have no serious intention or resources of going down the river.

Regarding outboard motors on the river, Grisham said motorized trips provide a high level of public access because of their shorter duration than regular float trips that can take up to 18 days.

"There's just a whole lot of people in this country who are not going to do this experience without motorized trips. They're not going to have two weeks of vacation time to come down and there is also a lot of people who are not comfortable on row boats," he said.

The advent of quieter engines and continuation of non-motor months on the river should defuse complaints over motors, he said.

Odem said the Grand Canyon Private Boaters Association favors phasing out engines over five years to give commercial outfits time to recoup their capital investment.

River Ecosystem Off the Table

Meanwhile, off the table for discussion at the meeting, much to disappointment of environmental groups, is the impact of Glen Canyon Dam on the river's endangered fish species, beaches and wildlife habitat.

Protesting that decision in classic guerilla theatre was one Owen Lammers, executive director of the environmental group Living Rivers of Moab, Utah.

Wearing a realistic headpiece depicting the extirpated razorback sucker, Lammers greeted hundreds of people entering the spacious Coconino College administration building Thursday afternoon.

Lammers and two other colleagues, one wearing an endangered humpback chub hat and another walking around inside a rubber raft and wearing an outboard motor on his head, provided comic relief to the session.

But the message from Living Rivers, a group organized several years ago with a mission to restore the Colorado River and remove Glen Canyon Dam, had a serious edge.

"We're trying to ensure that people who come to these meetings are fully aware that there is a critical issue in terms of the ecological integrity of the river corridor. Given that this is a management plan it seems logical that they would address the ecological integrity because it's in such serious decline," said Lammers.

The Glen Canyon Dam has changed river flows, eroded beaches and chilled the Colorado River water, with the result that native fish, which evolved in sediment-rich, warm waters, are either extinct or declining rapidly, he said.

Alston said the Glen Canyon Dam is out of the scope of the management plan and that the Park Service has no authority to dictate its operation.

Lammers disagreed.

"They're trying to sidestep the issue. The Park Service is the number one agency responsible for the ecological integrity of the river. They're trying to shuffle it off to the Bureau of Reclamation. They can't do that," he said.

Also off limits for the plan is discussion of merging the Colorado River Management Plan with a proposal to declare the 277-mile river corridor through Grand Canyon National Park as wilderness.

The Park Service recommended the river and nearly 1 million acres of the park be classified as wilderness. But until Congress approves a wilderness bill, there will be no merging of the wilderness in the plan, said Alston.

Tom Martin, a member of River Runners for Wilderness, said the Park Service is mandated to manage the river as a wilderness and restrict motors and excessive use of natural resources.

"When I walk around this room, what I see missing is anything to show that the park has to manage the river for its wilderness values and character," he said.

Additional public comment sessions on the Colorado River Management Plan are being held in Las Vegas on Aug. 13 and in Mesa Aug. 15. Comments can also be left on the Colorado River Management Plan Web site: www.nps.gov/gcra.crmp.

Phoenix papers on final CRMP meeting

Colorado River enthusiasts voice concerns

By Mary Jo Pitzl for The Arizona Republic

MESA - They came in shorts and sandals, skirts and T-shirts, fish heads and sarongs. People with an interest in how the Colorado River should be managed through Grand Canyon National Park milled about a conference room at Mesa Community College on Thursday evening.

The fish heads were oversized hats worn by members of Living Rivers, a group that is pressuring park officials to take into account how Glen Canyon Dam has imperiled various fish species.

Others came to weigh in on how to best allocate trips along the Colorado's 250-mile path through the Canyon.

Gaylord Staveley, in his 45th year of river-running, said park officials should freeze the waiting list for private boaters and figure out a better way to get those people on trips.

Staveley, who runs Canyoneers, a rafting company, said the problem is not that commercial operators get too many of the river's "user days" but that the park has lost control of how to best handle go-it-alone boaters.

Private boaters complain that they face waits of 19 to 20 years for a river trip and are pushing for a more equitable split of the coveted user days.

The Arizona Wilderness Coalition wants park officials to phase out motorized watercraft, which commercial operators oppose.

The coalition's Don Hoffman predicted that the loss of motors wouldn't dry up demand for river trips. "The oar trips are fuller than the motorized trips," he said.

Private boaters call for more permits to raft Grand Canyon

Scott C. Seckel
East Valley Tribune

The struggle for a chance to raft the Colorado River through the Grand Canyon dominated a meeting in Mesa held by park officials Thursday.

The system now in place—which dates back to the late 1960s—favors commercial outfitters. Out of 120,000 river days available, outfitters get 115,500 and private boaters get 54,450.

To get a private rafting permit, boaters put their names on a waiting list which now takes about 20 years to climb.

Private boaters want more permits set aside for them. John Dole, a Mesa resident and partner in a river gear rental company called Riverproff Outfitters, said he doesn't think the permit system is fair. "it's still skewed mightily to the commercial boaters," Dole said.

Outfitters at the meeting said that they wanted to preserve their livelihood and ensure that people without the equipment and skill can enjoy what all sides say is the experience of a lifetime.

Rob Elliott owns Arizona Rafting Adventures, a Flagstaff-based outfitting company. He said he wasn't worried about his business being affected—he said he could retire if he wanted to—but he wants "a fair process that will serve all sectors of the public."

A host of other issues were raised by a crowd of about 250 who attended the four-hour meeting, such as motors or no motors on boats, wilderness or recreational area at the Canyon, and what about saving rapidly disappearing native fish?

The meeting was one of a series being held around the West this summer to gauge public opinion on river corridor management. Current policies will be changed in about two years by a regional National Park Service director after public input.

Environmentalists protested the recreational focus of the meetings. Four native fish are extinct in the stretch of the Colorado running through the Canyon, according to Owen Lammers, executive director of the Scottsdale-based environmental advocacy group.

"What good is a river trip if they've lost the ecological integrity that made it a national park in the first place?" Lammers said.

RRFW Riverwire - GRAND CANYON SCOPING ADDS 2 CITIES

GRAND CANYON NATIONAL PARK EXTENDS PUBLIC MEETING SCHEDULE IN REVISION OF COLORADO RIVER MANAGEMENT PLAN

On the heels of five successful open house meetings in cities throughout the West, Grand Canyon National Park Superintendent, Joseph F. Alston, today announced the Park's intent to conduct two additional public meetings in the San Francisco/Oakland and the Washington, D.C./Baltimore areas. Meeting dates and locations are forthcoming and will be posted on the Colorado River Management Plan (CRMP) Web page www.nps.gov/grca/crmp

Meetings in Denver, Colo.; Salt Lake City, Utah; Flagstaff, Ariz.; Las Vegas, Nev.; and Mesa, Ariz. were held during the first two weeks in August and drew attendance from approximately 850 people. To date the Park has received more than 3,000 comments via various public involvement venues, including the Internet, mail, hand-delivered letters and the open houses. "We were very pleased with the attendance at the open house meetings," Alston said. "The format lent itself to helping everyone realize the complex issues we face as we prepare the draft environmental impact statement (EIS).

There was a lot of discussion we hadn't heard in the public involvement phase before." Alston said these meetings were added to give the public, interested organizations and agencies further opportunity to interface with Park staff, have their questions answered and submit comments. "Many other governmental agencies work with the Grand Canyon National Park," Alston said. "The final results of this EIS could affect their dealings with the Park, so there is a lot of interest there."

In June the Superintendent announced the initial meetings, the first stage in preparing an EIS to update the CRMP for Grand Canyon National Park. The National Park Service (NPS) is preparing the EIS for the Plan under the provisions of the National Environmental Policy Act (NEPA) of 1969.

The purpose of this EIS is to update management guidelines for the Colorado River corridor through Grand Canyon National Park. Current guidelines can be found in the 1989 CRMP. A copy of this plan, as well as background information and public comments received from past CRMP discussions, can be found on the Internet at [www.nps.gov.grca/crmp](http://www.nps.gov/grca/crmp).

In developing a draft CRMP/EIS, the NPS seeks public input to reaffirm previously identified agency and public issues, and to identify any new public issues and concerns. Scoping information will also be used to help narrow and define the significant environmental issues and management alternatives to be analyzed in the EIS. Public input will continue throughout the planning process. The NPS will actively seek out and consult with all interested members of the public.

During this process, the NPS will develop and evaluate alternatives to address resource protection issues, potential resource impacts, user capacities, and mitigation measures necessary or desirable to achieve the NPS mission. The NPS will review some key resource issues outside of the park's boundaries that affect the integrity of the Grand Canyon and will consider alternatives that include no-action (the status quo), no motorized use, and varying levels of motorized and non-motorized watercraft use.

Issues to be addressed in the EIS will include, but are not limited to:

- appropriate levels of visitor use consistent with natural and cultural resource protection and preservation mandates;
- allocation of use between commercial and non-commercial groups;
- non-commercial permitting system;
- level of motorized versus non-motorized raft use;
- the range of services and opportunities provided to the public; and,

- in consultation with the Hualapai Indian Tribe and other appropriate parties, the continued use
- of helicopters to transport river passengers from the Colorado River near Whitmore Wash.

Information about this planning effort and how the public can be involved throughout the process can be found in Soundings, a newsletter available on the Internet at www.nps.gov/grca/crmp. Due to the public interest in this planning process, the NPS has decided to extend the public comment period until November 1, 2002. Comments can be submitted by any one of the following ways:

- mail to CRMP Project, Grand Canyon National Park, P.O. Box 129, Grand Canyon, Arizona 86023;
- send by electronic mail to grca_crmp@nps.gov;
- hand-deliver to Grand Canyon National Park; or
- provide at one of the public scoping meetings to be announced.

Completion of the EIS process will fulfill an agreement reached through a negotiated settlement of recent litigation between several organizations and individuals and the federal government. The settlement requires the NPS to complete this EIS by December 31, 2004. The NPS plans to restart the process to review and revise the park's 1988 Backcountry Management Plan subsequent to the completion of the CRMP. For further information on this planning process, please contact Jeffrey Cross, Director, Grand Canyon Science Center at 928-638-7759.

To be placed on the park's CRMP Newsletter mailing list, please send your request along with your email address to: grca_crmp@nps.gov.

RRFW Riverwire - GUNNISON GORGE MANAGEMENT PLAN UPDATE

August 29, 2002

This year, the Bureau of Land Management's Gunnison Gorge National Conservation Area has begun a new recreational management planning process. An on-river focus group was held August 19-20. Jo Johnson of River Runners for Wilderness also represented the Grand Canyon Private Boaters Association, Colorado Whitewater Association, and private boaters in general, on the trip and at a meeting in Montrose the following evening. Steve Christianson, GCPBA member from Utah, and

members of the Western Colorado Congress, an environmental & community group which has been very involved, also represented non-commercial interests. Local non-commercial boaters have not been heavily engaged in the planning process.

While the Gorge's 6 river outfitters, 2 walk-in fly fishing outfitters and the horse packing outfitter are good stewards of the Gorge, the river outfitters want to change current rules to get more launches, allow larger group sizes, and to limit private boater access.

In his keynote speech, noted author, teacher, and river runner Rod Nash urged participants to avoid the type of planning mistakes Grand Canyon National Park made 30 years ago and is still dealing with, and to remember that "Wilderness is a state of mind".

The outfitters suggested:

- A permit system for privates ostensibly for educational purposes, but not necessarily to limit private boater access. Currently, the fee demo form serves as a permit of sorts. Private boaters sign an agreement on the back to observe standard river rules (fire pan, toilet, etc.).
- A limit on private boater and fisher access, particularly during stone fly hatch/high water, with no decrease or possibly even an expansion in commercial launches. Currently, there is no limit on private boaters/fishers although BLM's target maximum is 75 people. During about 10 days in June the limit is exceeded, sometimes by quite a bit.
- 50 to 100% more launches for outfitted services. A large portion of commercial launches go unused, and outfitters say there is not enough flexibility in scheduling launches. Outfitters have a total of 2 launches per day, but are free to trade launches among themselves.
- Larger group sizes than the current 12 (which includes guides) (a number supported by the BLM's campsite survey) because commercial vans carry 15 passengers.
- To change their permit renewals to avoid the Chaffee/Gunnison County entertainment tax which is calculated on permit term.
- To keep outfitter permit renewals at 5 years so they don't have to go through a re-bidding process every year.

For those unfamiliar with the Gunnison Gorge, it is a 14 mile run through a small designated wilderness downstream of the Black Canyon of the Gunnison. The road stops 1 mile above the Gorge at Chukkar Trail, and gear is horse packed and backpacked in from there, which does limit access. Camps are reserved at the put in: first-come, first-served. While the camps do look very used, the corridor is clean and pristine, and the whitewater is technical (up to class III-IV). Boaters and hikers use different campsites.

Private boater representatives made these points in response to outfitter proposals:

- Rules should be applied evenly across sectors. For example, there should be no reserving of bigger camps for commercial use only as is now being done elsewhere, is not fair to non-commercial boaters.
- Permits have historically led to limits on access. Non-commercial boaters are, for the most part, acting responsibly, so why impose more restrictions on their access, especially in light of commercial use allocations presently going unused?
- Because demand cannot be measured, the only fair way to distribute access is by having all boaters stand in the same line to reserve space on the river. They chose how they go after making their reservation. A new paradigm for access is needed—it is unfair and unrealistic to limit non-commercial boating when 35% to 50% of commercial launches have gone unused in each of the last 9 years.

Karen Tucker, BLM Gunnison Gorge Manager, is spearheading a truly impressive effort to include all stakeholders and all points of view. If it is humanly possible, the result will be a finely crafted plan that protects the resource and truly reflects the public's wishes on recreational issues. The BLM has hired a planning contractor, Tetra Tech of Boulder, to assist with the effort.

To get more information or comment on the plan, please visit their website at www.gunnison-gorge-eis.com. Comments need to be made as soon as possible. To get more information about the area and see a great slide show of the gorge, visit www.co.blm.gov/ggnca.

River News 08/29/02

OAR TRIPS JUST AS SAFE AS POWERBOAT TRIPS IN GRAND CANYON

Reprinted from The Wilderness Society Fact Sheet, August 2002

For the past 50 years, concessionaires have dominated access to the Colorado River. By switching overwhelmingly to powerboat tours, they are pushing visitors down the canyon at an accelerated pace to improve their profits. However, racing through the canyon diminishes the wilderness experience of the river. Concessionaires currently hold 80% of the permits, and are responsible for increasing the congestion and noise. The National Park Service is starting a new Colorado River Management Plan. This process provides an opportunity to restore the wilderness qualities of the Colorado River.

MYTH - The concessionaires claim that a powerboat tour is the only safe way to experience the Colorado River.

REBUTTAL - This is simply not true; perpetuation of this myth helps concessionaires maintain their control over Colorado River management. Oar trips on the Colorado River are as safe, if not safer than powerboat tours. The fact is that “commercial motor trip fatality frequency is 2.7-fold higher than that on commercial oar-powered trips .” Scientific studies have proven that a motor does not protect you from injuries in the Grand Canyon. Rafting the Colorado River is safe; here are the facts on injury and mortality on Grand Canyon river trips.

- Overall, running the Colorado River is not a risky endeavor. The chance of injury during Colorado River trip is very low. Current risk is 2.36 injuries per thousand and mortality risk is 0.004 percent.(1)
- Studies indicate that the lower risk of fatality on oar-powered rafting trips may be influenced by the passenger:guide ratio. This ratio is much lower on oar-powered rafting trips than on powerboat tours. Therefore, the oar-powered trips are safer since a lower passenger:guide ratio results in better supervised passengers and less chance for injury.(2)
- The most deadly hazard in the Grand Canyon is heat illness. It can strike visitors anywhere in the canyon, but most cases of heat stroke occur in visitors hiking in the National Park backcountry and not on river trips.(3)
- Studies of injuries have found that there is no difference in injury rates between commercial (primarily powerboat) tours and self-guided (primarily oar) trips.(4)
- Injury frequency on Grand Canyon rafting trips is very low. A passenger has a greater overall injury risk playing golf than rafting the Grand Canyon.(5)
- The mean age of injured passengers was lower than the mean age of passengers. Therefore, elderly passengers are not at any greater risk of injury; no matter what type of rafting experience they choose.(6)
- The majority of reported injuries occur while the rafters are engaged in off- river activities. Therefore, playing, hiking, drinking alcohol, etc around camp is more dangerous than running the river on a commercial oar trip.(7)

WHO RAFTS THE COLORADO RIVER THROUGH THE GRAND CANYON?

Reprinted from The Wilderness Society Fact sheet, August 2002.

Proponents of powerboat tours through the Grand Canyon insist they are necessary to provide the majority of the American population access to the river. However, the facts show that all ages can enjoy self-guided rafting trips and that pricey powerboats tours are only available to the wealthy few.

Commercial passengers hire a rafting company to take them through the canyon. The company rows (or powers) the boat, takes care of navigation and trip preparation, cooks the meals, and is responsible for first aid. In contrast, self-guided trips generally are 'led' by a person with extensive rafting experience, often on the Colorado River, and the group shares responsibility for rowing, navigation, cooking, and first aid. The vast majority of self-guided trips are oar-powered.

The Park Service and Bureau of Reclamation have commissioned several studies to look at the differences between these user groups. The studies were then used for determining permit allocation on the river. Based on this information, here are some facts about the user groups:

The studies revealed:

- Forty seven percent of commercial passengers have a household income over \$100,000 while only 12% of the national population have a household income over \$100,000. The household income of self-guided boaters is very close to the national average (within 5%).(1)
- A motorboat tour of the Grand Canyon costs ~\$300/day, a steep price tag for the average American.(2)
- Currently, 24% of powerboat tour passengers, 74% of oar-powered commercial passengers, and 85% of self-guided boaters believe the canyon would be more of a wilderness if motors were phased out.(3)
- Age is not an impediment to enjoying an oar-powered journey. Both passengers on commercial tours and self-guided rafters range in age between 10 to 82 years old.(4)
- Most commercial passengers do not experience the full Grand Canyon, entering or leaving the river trip at Phantom Ranch or by helicopter at Whitmore Wash . In contrast, all self-guided boaters take the time to experience the entire canyon.(5)
- Self-guided paddlers and commercial oar passengers tend to experience more of the wilderness qualities of the Grand Canyon by staying longer at attractions and spending more time on the river.(6)

OUTFITTER MYTHS YOU SHOULD KNOW ABOUT

Myth: The new plan will reduce the number of people able to take a river trip.

Correction: The current plan was set up and has been run in such a way that tens of thousands of people have been prevented from running the river over the past 20 years. A plan based on wilderness principles and fair access for all could increase visitation.

Myth: The river environment is now being used to full capacity.

Correction: The Grand Canyon could handle more people if wilderness policy was enforced. Social contacts would be diminished if launches were no longer bunched on weekends.

Myth: The new plan will prevent old, young, and the disabled from taking trips.

Fact: The current plan grossly favors large motorized rafts that are more difficult to use by old, young, and disabled people. Rowing trips have a higher crew to passenger ratio, and utilize more accessible craft. Research shows that people of all ages and capabilities use, and prefer, rowing trips.

Myth: The river will be restricted to an elite few under new proposals.

Fact: Under the current plan, half of commercial passengers come from upper income brackets (over \$100,000 per year). Currently, motorized commercial trips are exorbitantly expensive. The new plan must emphasize visitation by a much broader spectrum of users.

Sedimental Journey Challenges BuRec's Birthday

Volume 2, Number 5, September 2002

As the last of the fireworks exploded over the Bureau of Reclamation's (BuRec) \$600,000 centennial party at Hoover Dam, a ceremony of a much different sort was underway 250 miles upstream. A river restoration crew labored well into the next morning to deliver three tons of sediment to Grand Canyon's suffering river ecosystem. With the last grains of sediment deposited, Living River's first Sedimental Journey was proclaimed a success.

Five nights earlier it all began at a rally on the banks of a free-flowing Colorado above Canyonlands National Park. Accompanied by music, dancing and calls for river restoration, a brigade of activists loaded 300 bags (25-pounds each) of sediment from a sandbar in the middle of the river. The bags were paddled ashore and loaded into a dump truck emblazoned with banners reading "Reclaim the Bureau," and "Return the Sediment, Return the Flow, Save Grand Canyon from Glen Canyon Dam."

The caravan then began its journey downstream supported by 85 environmental and social justice groups demanding immediate action by BuRec to correct the damage Glen Canyon Dam has caused to Grand Canyon's river ecosystem. More sediment was gathered at the Journey's second rally at Antelope Point, on the Navajo reservation adjacent to Lake Powell reservoir. Max Goldtooth, a Navajo medicineman and water activist stated, "We've not taken care of our rivers and that's why we're having these droughts. Our offerings are blocked in their journey to the ocean by these dams."

The next day road vehicles were abandoned for a flotilla of nine boats to float the 15 miles of the Colorado River below Glen Canyon Dam. Just as the native fish are no longer able to survive in Grand Canyon, we too shivered in the 46 degree water released from the dam. The lack of natural sediment was also fully evident in the crystal clear water. But amidst the 800-foot sheer walls of this, the un-inundated section of Glen Canyon, we made the first offering of sediment back to the river.

Sediment was scheduled to be deposited following the conclusion of a rally held early in the day at Lee's Ferry, the launch location for Grand Canyon river trips, but the National Park Service banned the release of any of our sediment. "It's obscure why they want to arrest me for attempting to comply with the Grand Canyon Protection Act, and for attempting to do my part to heal the river," said Dr. Brent Blackwelder, President of Friends of the Earth.

Following a rally in Grand Canyon National Park the next day, the Journey held its final event at Hoover Dam, a few hours in advance of the BuRec's centennial celebration. Visitors to the dam were treated to river restoration melodies, dancing fish and the truth about the impacts of BuRec's devastation of the Colorado. "It's time for BuRec to get on with the task of decommissioning Glen Canyon Dam," the Sierra Club's Marcia Hanscom told the crowd gathered at Hoover Dam. "Grand Canyon deserves better and so does the Colorado River."

That was the message picked-up by the media at each stop along the 700-mile journey. So although our truckload of sediment, which was finally delivered to the Grand Canyon later that evening represented just .000003% of the amount which it should naturally receive, it represented a significant step toward building public awareness and interest in the reform of the Bureau of Reclamation and restoration on the Colorado River.

Living Rivers Currents 09/01/02

Navajo Dam: BuRec Says "No" to Decommissioning

Volume 2, Number 5, September 2002

The Bureau of Reclamation (BuRec) has released its draft plan for the re-operation of Navajo Dam, the largest dam on the San Juan River. Under requirements of the Fish and Wildlife Service to take steps to reverse the decline of native Razorback Sucker and Colorado Pikeminnow habitat in the San Juan, BuRec is proposing flow recommendations to reduce the likelihood that the river will run dry, as it nearly has with increasing frequency.

In assessing the decommissioning alternative proposed by Living Rivers and others, BuRec states "It would result in the loss of reservoir storage needed to allow for contract

water deliveries to the San Juan-Chama Project, the NIIP [Navajo Indian Irrigation Project] and other contractors...”

The NIIP has yet to be fully completed, and has been a money loser from the start. The Navajo Nation could generate far more revenue were it to sell water to users downstream, than to continue with the NIIP. The San Juan-Chama water is primarily used to supplement Rio Grande instream flows for endangered Silvery Minnow. Rio Grande water users should get their own water budgets in line, not divert water from the San Juan, which has its own instream flow needs to protect endangered fish.

BuRec is recommending that flow levels out of Navajo Dam be as low as 250 cubic feet per second. With increasing diversions occurring over the 171-mile river corridor downstream of the dam, Living Rivers believes this will not be enough water to prevent stream dewatering.

Comments on the Draft EIS will be accepted until November 4, 2002. For additional information contact Living Rivers.

Grand Canyon: LR Takes on New River Managment Plan

Volume 2, Number 5, September 2002

The National Park Service (NPS) is getting underway on rewriting its management plan for the Colorado River through Grand Canyon National Park. With four of the Canyon's eight native fish species extinct, two more headed in that direction and little action on behalf of the Park Service to uphold the Endangered Species Act against the impacts of Glen Canyon Dam, Living Rivers initiated an organizing effort to demand that this new plan address the declining ecological integrity of the river.

When first announced, NPS implied that this new river plan would principally focus on human recreation on the river and defer all comments pertaining to river ecology to the Bureau of Reclamation's Adaptive Management Program for Glen Canyon Dam. This runs counter to the first goal of its existing 1989 plan, "To preserve the natural resources and environmental processes of the Colorado River corridor and the associated riparian and river environment."

"The Park Service's failure to preserve natural process is rationale to elevate this objective to the highest priority, not to eliminate it from their management objectives altogether," said John Weisheit, Living Rivers Conservation Director. Weisheit and other Living Rivers staff and volunteers took this message on the road for two weeks in

August. Dubbed the “Habitat Security Tour,” the crew conducted outreach at public meetings pertaining to the river management plan in Denver, Salt Lake City, Flagstaff, Las Vegas and Phoenix.

Clad in life-like endangered fish costumes of Humpback Chubs and Razorback Suckers, and sporting Living Rivers Habitat Security jumpsuits, participants were greeted with a friendly message about the need for swift action on behalf of NPS to reverse the native habitat decline in Grand Canyon’s river corridor.

“You’re certainly getting your message out,” said Joe Alston, Superintendent of Grand Canyon National Park, and “We want you to know that we do care about the fish.”

In the letter delivered to Mr. Alston, in Denver, Living Rivers also reinforced that the ecological changes occurring in Grand Canyon’s river corridor represent a significant violation of the NPS’s Organic Act (1916) which requires that NPS preserve its lands unimpaired for the enjoyment of current and future generations. Specifically the letter demanded that the new river management plan identify means to:

- Restore essential sediment and nutrient flows from the mainstem Colorado River into Grand Canyon.
- Restore natural flow regimes to properly transport this sediment within Grand Canyon, when and where the sediment belongs.
- Restore natural seasonally variable water temperatures in the mainstem Colorado River through Grand Canyon.
- Develop a restoration and recovery program for the Colorado River corridor in Grand Canyon that includes the full recovery of all species known to be native to Grand Canyon prior to the operation of Glen Canyon Dam.
- Implement a non-native eradication program to minimize alien species in the Grand Canyon River corridor with a priority on those that prey on, compete with, or otherwise impair the health of native plants and animals.

To further this effort, Living Rivers has also helped to form the Grand Canyon Wilderness Alliance, a nationwide coalition working to ensure this new river management plan addressees a range of issues. In addition to ecological integrity, high on the Alliance’s list is ensuring the river corridor is managed as wilderness, eliminating the use of motorized rafts, and improving access for private river runners, who currently must wait up to 20 years to run the river as commercial outfitters are given 80 percent of the permits.

Public comments on the proposed scope of the Grand Canyon River Management Plan are being accepted until November 1, and additional public meetings are scheduled for Washington DC and San Francisco. Please send letters demanding that the Park Service address the river’s ecological integrity in the plan. Direct them to: Colorado River Management Plan, Grand Canyon National Park, PO Box 129, Grand Canyon, AZ 86023. Email: grca_crmp@nps.gov

Fossil Creek: APS Files for Surrender

Volume 2, Number 5, September 2002

Arizona Public Service Company (APS) has filed with the Federal Energy Regulatory Commission (FERC) a long-awaited "application to surrender" its license for operating the Childs-Irving Hydropower Plants at Fossil Creek. The Application to Surrender

marks perhaps the most significant milestone yet in Living Rivers battle to restore Fossil Creek and the surrounding riparian habitat.

The Childs and Irving plants are 90 and 100 years old respectively and draw the entire flow of Fossil Creek out of the stream bed and into a series of penstocks, flumes and tunnels for hydropower production. The plants produce a minuscule amount of power in comparison to the major damage they wreak on Fossil Creek, a perennial stream in the central Arizona desert.

The United States Forest Service (USFS) however is somewhat concerned. "Although the Forest Service strongly supports the goal of surrender and decommissioning to restore full stream flow to Fossil Creek, the Forest Service opposes certain provisions of the settlement agreement." Of particular concern is the USFS's request that "Additional or different structures are retained in the project site." Before the agreement was signed, each of the significant 52 components of the plants was considered, studied and its removal or retention painstakingly negotiated. To reopen these negotiations would be an unnecessary bureaucratic burden.

Living Rivers and the other environmental groups involved in the initial negotiations are still highly engaged and prepared to battle for nothing less than the initial goal: full flows to Fossil Creek. No compromise is acceptable.

Living Rivers Currents >09/01/02

Climate Change: Uncertainty for the Colorado

Volume 2, Number 5, September 2002

The Environmental Protection Agency (EPA) and the United States Geological Survey (USGS) have published studies concerning global climate change and how these predicted changes could affect our future water supplies. As the Colorado River is the major supplier of water for 30 million people, these important studies forecast scenarios for both a severe sustained drought and also for years of severe flooding.

The results suggest the following for the Colorado River basin:

- streamflow can increase or decrease by as much as 30 percent
- the 400-year average virgin streamflow for the Colorado River at Lee's Ferry in northern Arizona totals 13.5 million acre-feet per year (16.4 was the original projection)
- the 20th Century was a wetter century than normal, with an approximate 20 percent higher yield
- high magnitude floods can stress spillway mechanisms and overflows will damage areas of development; dam failures are possible.

The above data does not compliment the “Law of the River,” the working document that governs the allocations and delivery systems for the seven states of the Colorado River basin and Mexico. Nature’s variations and man’s miscalculations will make it more and more difficult to plan for the long-term management of our water resources.

The data suggest that in the last 400 years there have been many severe sustained droughts in the Colorado River basin, with the longest occurring about 1579-1598. During that 20-year cycle it has been estimated that a 20 percent reduction in streamflow occurred for the Colorado River basin. Within that 20-year period there was a five-year cycle where streamflow was reduced by 34 percent. Says Robert Webb at the USGS Desert Lab in Tucson, “It is impossible to predict the weather for the next 20 years. We do know that as more and more people become dependent upon the available surface water and as our groundwater reserves become depleted, that it is going to be harder and harder to project and meet our upcoming operation plans.”

In modeling the affects of a severe sustained drought, it has been demonstrated that current water allocations will especially stress the upper basin states because their water rights are largely junior to those of the lower basin. The lower basin will be affected in another costly scenario: an increase in the salinity of their water at levels above legal standards and the associated costs to mitigate that increase.

A severe sustained drought for the Colorado River basin will also bring reservoir levels to near dry conditions and will effectively reduce hydropower by as much as 36 percent. However, it was noted in the reports that such a reduction in electricity would not cause major disruptions for most regional power grids. For Lake Powell, reservoir levels would drop 230 feet to the elevation of the generator’s intake pipes (penstocks) and would subsequently leave boat ramps and marinas high and dry. Compounding the situation would be the 30 miles of sediment plugs for both the Colorado and San Juan River arms.

According to John Dohrenwend, a retired USGS surficial geomorphologist, “As the rivers erode through these sediment deposits, the sand and silt will be mobilized and deposited closer to other reservoir facilities, including Glen Canyon Dam. Such sediment transport would significantly diminish the life expectancy of Lake Powell reservoir.” Because of the legal mandate to deliver on average 8.23 million acre-feet of water per year to the lower basin, Lake Mead reservoir levels would not be as drastically reduced. However, Lake Mead is still projected to experience diminished reservoir levels that would have similar sediment impacts on its water quality and recreational access.

Since 1942 there has been a reduction of sediment inputs into the reservoirs of the Colorado River basin. Current storage of normal erosional materials now occurs in the side streams and arroyos of the Colorado, Green and San Juan Rivers. Large destructive floods, such as occurred from about 1862 to 1941, will eventually transport this stored sediment into the many reservoirs of the basin. The deposition and storage of this sediment would greatly reduce the water storage capabilities of the reservoirs and consequently tax the flood control features of the dams. Catastrophic flood events

have been projected to even remove dams, which would consequently destroy the water delivery structures downstream. With no infrastructure to deliver water to the farms and metropolitan areas of the Southwest, the region's economic base would be severely compromised.

Richard Hereford of the USGS at Flagstaff, notes that, "Based on the remains of flood deposits in the vicinity of Lee's Ferry, Arizona, we know that streamflows of 500,000 cubic feet per second have occurred in our historic times." Glen Canyon Dam is designed to bypass flood flows but much depends on the duration of the flood, the volume of the flood and how much reservoir storage is available. In 1983, when the reservoir was full, spillway damage did occur when the total discharge at the dam was only 92,600 cfs, which also caused millions of dollars in flood damage to the lower basin.

With the scientific information currently available on climatic scenarios, obviously the current system of water allocation and delivery systems in the thirsty West is seriously flawed. It is therefore absolutely necessary to continue the process that will modify the various aspects of water law, policy and infrastructure with rigor and vigilance.

Living Rivers Currents 09/01/02

BuRec Commissioner John Keys Wants to Hear from You!

Volume 2, Number 5, September 2002

At the end of September BuRec will release a draft environmental assessment for experimental operations of Glen Canyon Dam to restore native fish habitat in Grand Canyon. In 1996 such tests failed and these will too. Join Living Rivers and the Grand Canyon

Coalition in telling BuRec to stop testing, and start fixing, the Grand Canyon. Meetings are to be announced for Phoenix and Flagstaff. Living Rivers Habitat Security Force will be there. Check Living Rivers website for details, including advise on, and where to send in your comment letters.

RRFW Riverwire – OUTFITTER POLICY ACT STAGES A COMEBACK

September 11, 2002

HR 2386, the Outfitter Policy Act, is scheduled for House Resources Committee "mark-up" tomorrow. Please call your congressperson in regards to this bill. This is especially important if your congressperson is on the Resources Committee (list at end). It is important that Congress know that this bill is controversial and that it severely hampers land managers and the public.

The RRFW is opposed to the Outfitter Policy Act of 2001 (HR. 2386) because the bill fundamentally alters the laws governing the management of our public lands, provides new privileges to one class of recreational user at the expense of the general public and other users, restricts the powers of federal land managers to best manage lands for multiple use, and puts non-profit institutional organizations at a disadvantage when seeking to conduct educational and recreational outings for their members.

Opposition to HR. 2386

This bill reduces land agency discretion in management of public lands and limits public and non-commercial use of public lands as the bill would --

1) Burden federal land managers to guarantee "reasonable opportunity" for profits to commercial outfitters using public lands. This will result in: o "Grandfathering" commercial outfitter use in areas where high recreational demand mandates restrictions on public recreation access, thereby creating disproportionate use of scarce public resources by a select group o Limiting the number of authorized outfitters so that each has a better chance to make a profit, thereby limiting public choice and the benefits of healthy outfitter competition o Granting outfitters potentially greater access to federal lands than the public

2) Elevate commercial outfitter permits to a legal status greater than other types of federal permits, allowing permits to be transferred, inherited or sold and restricting the ability of land managers to modify, enforce or revoke permits

3) Continue to leave the status of institutional groups and non-commercial outfitters ambiguous, allowing different interpretations of the rules in different land agency jurisdictions

The favoritism provided to commercial outfitters coupled with the continued uncertain definition of institutional groups would reduce or eliminate outings by non-profit civic, children, and environmental education groups in our nation's most popular recreation areas. Even volunteer-led outings would be reduced or eliminated.

While there may be a need for reform of current permitting policies, there should be a clarification of the permitting process for non-profit institutional groups - an area not explicitly addressed by the current legislation.

Save San Juan River endangered fish: Decommission Navajo Dam!

The status of the endangered fish of the San Juan River has become supercritical. In 1992, fishery biologists working on the San Juan River were unable to find any adult Razorback Suckers and only about 100 adult Colorado Pikeminnows. Now, no adult fish of either species can be found. All because of the operations of Navajo Dam.

The Bureau of Reclamation has released a Draft Environmental Impact Statement (DEIS) proposing flow modifications for Navajo Dam, but this is too little, too late. Your input is urgently needed to demand that BuRec more comprehensively address and recommend the decommissioning alternative referenced in the DEIS so that it can comply with the law and recover the endangered fish of the San Juan River.

- Navajo Dam caused the inundation of critical breeding habitat, and blocks the natural migration route to rearing habitat 100 miles downstream. The major issue is not flows, but this loss of habitat and the river's natural dynamic processes. San Juan River endangered fish must be able to spawn high enough in the river channel, such that hatchlings can become sufficiently strong prior to be flushed into Lake Powell reservoir and consumed by non-native fish. The only way to remedy this situation is to move forward with the decommissioning alternative for Navajo Dam.
- The San Juan River's other critical native fish nursery habitat was inundated by Lake Powell reservoir. Therefore, a comprehensive EIS of the decommissioning of Glen Canyon Dam must also be undertaken to ensure the recovery of San Juan River endangered fish.
- The preferred alternative of a minimum flow of 250 cfs (cubic feet per second) outlined in the DEIS is unhealthy. It will degrade the water quality and promote the growth of algae, which depletes oxygen necessary for viable native San Juan fish habitat, were such habitat in existence.
- The 500 cfs minimum alternative, although theoretically better than the 250 cfs preferred alternative, does not address the loss of historic spawning habitat high enough up in the river channel to allow for native fish to sufficiently mature before the river propels them into Lake Powell reservoir.
- These proposed alternatives were based on experiments that yielded no demonstrated recovery of native fish, and are based solely on meeting water delivery contracts within the San Juan system and to maintain non-native trout habitat for sport fisherman.
- The DEIS does not sufficiently evaluate the impacts of potential future diversions on endangered fish habitat. The Animas-La Plata Project, Navajo-Gallup pipeline and further expansion of the Navajo Indian Irrigation Project will significantly

reduce flows necessary for recovery of San Juan River endangered fish habitat.

- The decommissioning of Navajo Dam will provide a net financial gain to Federal taxpayers, as the primary beneficiary of Navajo Dam is the Navajo Indian Irrigation Project, which receives subsidies averaging \$1.5 million annually because of the project's inefficiencies.
- The DEIS makes no provisions for addressing the predation of native fish by non-native fish such as Catfish and Stripped Bass.
- The DEIS makes no provisions for mitigating the impacts on endangered fish habitat from pollutants found in the river, such as PCBs, mercury, DDT, selenium, chlorine and chlordane.

For over ten years the San Juan River Basin Recovery Implementation Program has failed to restore a self-sustaining native fish population in the San Juan River as it flows through New Mexico, Colorado and Utah, and these new proposals offer more of the same.

Restoration of the river ecosystem can be implemented by simply creating programs that conserve water in our communities and farms. Such programs will save money, taxes and increase productivity while saving the natural and cultural heritage of the San Juan River.

Take Action

Say NO to new Glen Canyon Dam operations

The Bureau of Reclamation (BuRec) will soon be releasing a draft environmental assessment proposing new operating requirements for Glen Canyon Dam. BuRec's objective is to convince the public that it is working hard to stop the decline of the

Humpback Chub, which is about to become the fifth Colorado River endangered fish to go extinct in Grand Canyon National Park since the completion of Glen Canyon Dam. Your input is needed to tell BuRec that you are not so easily fooled, that its proposed tinkering with Glen Canyon Dam will not be enough to protect these fish, and that BuRec has been ignoring the law by not establishing a second population of Humpback Chub in the mainstem Colorado River in Grand Canyon National Park.

- BuRec has been experimenting with Glen Canyon Dam for more than six years. Over this time period Humpback Chub populations have declined from 8,000 to 2,000 adult fish. Furthermore, four other fish, Colorado Pikeminnow, Bonytail Chub, Roundtail Chub and Razorback Sucker, are already extinct. Nonetheless, BuRec has been widely promoting its efforts as successful, and indicative of a commitment to endangered fish recovery, when nothing could be further from the truth. BuRec must stop misleading the public and report on the true impacts of its dam operations on native fish habitat in Grand Canyon National Park.
- The flows being proposed only allow for minor changes in Glen Canyon Dam's operations, all of which could be overruled by electricity producing interests. BuRec must immediately implement operational guidelines for Glen Canyon Dam consistent with the 1996 biological opinion of the Fish and Wildlife Service calling for low, seasonally adjusted steady flows, and that such flows cannot be interrupted by any interests other than those agencies scientifically responsible for the recovery of the Humpback Chub.
- BuRec continues to ignore the a 1996 law requiring that a second population of Humpback Chub be established in Grand Canyon National Park. At present, only one population has been able to survive by moving to the Little Colorado River, in what historically has not been its native habitat. Therefore, in addition to addressing flows from the dam to influence habitat near the Little Colorado River, BuRec must meet the natural sediment, nutrient and water temperature needs to re-establish a second population of Humpback Chub in the Colorado River in Grand Canyon National Park.
- BuRec must complete a new Environmental Impact Statement on the reoperations of Glen Canyon Dam that addresses the full range of issues associated with the recovery of endangered Humpback Chub, and the full range of alternatives to resolve them, including the decommissioning of the dam.

Requesting expanded public participation for review of Glen Canyon Dam experimental flows

Mr. Michael Gabaldon
Deputy Director of Operations
U.S. Bureau of Reclamation
Department of Interior
1849 'C' Street, NW
Washington, DC 20240
Via Fax: 202-513-0308
RE: AMWG Public Participation

Dear Mr. Gabaldon,

Yesterday, the Bureau of Reclamation (BuRec) announced public meetings and its comment period for the Draft Environmental Assessment (DEA) of the proposed experimental flows from Glen Canyon Dam. BuRec has unnecessarily compressed the calendar for this public comment period, and in the process, further reinforced the continued disregard the Adaptive Management Working Group (AMWG) has for appropriate public participation.

1. The public has been given only 8/9 days notice for the upcoming public meetings (Flagstaff, AZ on October 2 and Phoenix, AZ on October 3). At minimum the public should be given 30 days notice of upcoming meetings.
2. The public will not be able to obtain the DEA, for which the public meetings are about, until the first of the two meetings. The DEA should be available for at least two weeks in advance of the first public meeting.
3. The public has only 18 days following the release of the DEA to submit comments. The public should have 30 days following the final public meeting to submit comments, or at minimum, 30 days following the public release of the DEA.
4. BuRec has scheduled the public meetings on the exact same days BuRec will be holding similar meetings on the Draft Environmental Impact Statement for the reoperations of Navajo Dam on the San Jaun River, making it difficult for members of the public to attend both.

To address these concerns, we respectfully request that you:

1. Add additional public meetings in Phoenix and Flagstaff with at least 30 days advance notice.
2. Extend the public comment period to 30 days after the final public meeting.
3. Require the AMWG to adopt and adhere to reasonable policies for ensuring adequate time for the public to participate in NEPA processes, such as commenting on the proposed experimental flows.

As the monsoon season in the watershed of the Paria River will have nearly passed, prior to any final decision being issued on this matter, there is no compelling reason not to extend the public participation process to accommodate a more reasonable schedule.

Furthermore, as was outlined in Living River's letter to you of January 18, 2002, the lack of attention to public participation by the AMWG is of major concern to us and the eight other organizations that signed the letter. You assured us that public comment was indeed a requirement of the AMWG process and that we would receive a timely response, yet none has been received.

As also mentioned in the January 18 letter, AMWG has a tremendous public responsibility for ensuring the future health and vitality of Grand Canyon's river ecosystem. As such, we appreciate the opportunity to participate in the upcoming meetings. We are concerned, however, that this ongoing disregard for making reasonable allowances for public input, and ignoring that input once received, continues to plague the effectiveness of the AMWG.

We look forward both to your response concerning this request to expand the public participation process for the experimental flows, and to our letter of January 18, 2002.

Sincerely,

Owen Lammers
Executive Director

LR Press Release 09/25/02

**New dam flows to further fish extinction in Grand Canyon
Public Played for fools by Interior Department**

Contact:

Owen Lammers 435-259-1063
Lisa Force 480-990-7839

Yesterday the [Bureau of Reclamation \(BuRec\) announced](#) plans to solicit public comments on proposed experimental operating guidelines for Glen Canyon Dam under the guise of restoring endangered fish habitat in Grand Canyon National Park. Should the plan be implemented as proposed the endangered fish in question, the humpback chub, will likely be extinct before they can complete their multi-year experimentation.

"This is nothing more than the latest act in a six year-long charade by BuRec, and the water and power interest that control the operations of Glen Canyon Dam, to pretend that they are serious about reversing the extensive damage this dam has caused to one of the world's most famous national parks," says Living River's executive director Owen Lammers.

Since 1996, the Department of Interior has been required to establish viable populations of endangered humpback chub in two sections of the Colorado River in Grand Canyon National Park. But despite much fanfare surrounding this proposed and past experiments at Glen Canyon Dam, they have only succeeded in administering to the decline of the one remaining population. As of the summer of 2001, just 2,000 adult humpback chub remained in Grand Canyon, down from more than 8,000 when their experiments began.

Since BuRec and its supporters continue to only partially address some of the major variables impeding native fish recovery in Grand Canyon, the list of extinct native fish in Grand Canyon will soon increase from four to five. The razorback sucker, bonytail chub, roundtail chub and Colorado pikeminnow are already extinct in Grand Canyon due to the operations of Glen Canyon Dam.

- The current proposal will not reintroduce any of the 100 million tons of the sediment and nutrients critical for native fish habitat. It will only, if successful, reposition the minimal sediment remaining in the Canyon.
- The current proposal will not fully simulate the natural rivers flow through the dam, only partially mimic a high water event over a few days and in the dead of winter when natural flows would be quite low.

- The current proposal will not address the need to increase the river's water temperature, the major factor impeding native fish reproduction due to gonad suppression, as dam operations dropped the river's temperature to 46 degrees.

"They just want to tell the public, 'we tried,' and then go back to operating the dam however they wish once the fish are extinct," adds Lammers.

Living Rivers is also concerned with the accelerated public review process for this new proposal. Barely a week's notice was given for public meetings scheduled for Flagstaff and Phoenix, Arizona next week, and the public will only have 18 days to review and submit comments on the draft proposal's draft environmental assessment. [Living Rivers has asked that this process be extended.](#)

U.S. wants to flood Canyon to save native fish

By Shaun McKinnon for The Arizona Republic

Federal officials want to flood the Grand Canyon and evict thousands of non-native fish from the Colorado River next year in a repeat of a controversial 1996 experiment that produced inconclusive results and temporary benefits.

The U.S. Bureau of Reclamation will present its proposal at public briefing sessions this week in Phoenix and Flagstaff, outlining a plan scientists hope will begin to mend an ecosystem bruised more than 40 years ago by the construction of Glen Canyon Dam.

The two-year experiment calls for artificial floods similar to one staged in 1996 aimed at rebuilding some of the riverbanks and beach habitats along the canyon floor.

Scientists also would remove as many as 20,000 non-native rainbow and brown trout from the river in an effort to improve conditions for endangered native fish such as the humpback chub, whose numbers have dwindled from 8,000 to about 2,000 since the mid-1990s. The trout are thought to prey on the chub.

The experiments are part of a long-term goal of correcting problems created by the dam, including the loss of natural sediment, a drop in water temperature and the introduction of non-native fish. The floods, for example, attempt to mimic temporarily the natural behavior of the river, whose flows once fluctuated significantly over a year's time.

A 1996 flood, presided over by former Arizona Gov. Bruce Babbitt, then-Interior secretary, appeared to shore up some of the damaged beaches with few of the side effects predicted by critics.

Later studies suggested the flood's effects were short-lived and did little to help the endangered fish.

Several environmental groups say the latest plan is too little too late, especially for the chub and other species struggling to survive in their altered environment.

Owen Lammers, executive director of Living Rivers, called the proposal "the latest act in a six-year-long charade" by the bureau and water and power interests whose inattention has threatened the river's ecosystem.

"They just want to tell the public, 'we tried,' and then go back to operating the dam however they wish once the fish are extinct," Lammers said.

He said the experiments fail to reintroduce any new sediments and nutrients critical for native fish habitat and don't address the need to raise water temperatures below the dam. Native fish struggle to survive in the colder river, while the non-native predators thrive.

Nikolai Ramsey, program officer for Flagstaff-based Grand Canyon Trust, said the experiments will produce benefits, but delays in their start have compromised the overall goals.

Changes in the river's flow should have begun in early September to properly prepare the river for a full-scale artificial flood, Ramsey said. He also worries that the government has lost sight of the endangered fish, which continue to die.

"We should be putting our efforts more strongly into saving the chub," Ramsey said. "This is a fish that has lived in the Colorado River and only the Colorado River for 2 million years and now is close to extinction because of what we've done to the river."

Ramsey predicts stiff opposition to the government's plan from both environmentalists and others with a stake in the river, including sport fishery groups.

The timing and scale of the experiments will hinge in part on weather conditions in the coming months. Drought choked summer runoff from the Paria River, a tributary of the Colorado that in normal years would have shifted sand and sediment downstream into position for the artificial floods. Scientists don't yet know if there's enough to stage a flood by January.

Randy Peterson, manager of the bureau's upper-Colorado environmental resources division, said that plans allow scientists to adjust the schedule for the larger floods, which send water gushing through Glen Canyon Dam's rarely used bypass tubes. Those floods would take place as soon as the Paria delivers enough sand and sediment.

The fish relocation could begin as early as January, when above-normal flows from the dam would be used to disrupt spawning. Later in the year, biologists would use electrical charges to stun the fish at various spots along the river. The non-native fish would be removed and relocated, while native species would be left in the river.

Media Advisory 10/01/02

**River and Navajo activists call for Decommissioning of Navajo Dam
San Juan River endangered fish in jeopardy because of Dam**

Contact:

John Weisheit (435) 259-1063; Mobile (435) 260-2590

Lisa Force (480) 990-7839

The status of the endangered fish of the San Juan River has become supercritical despite efforts of the San Juan River Basin Recovery Implementation Program, which started in 1992. At that time fishery biologists working on the San Juan River were unable to find any adult Razorback Suckers and only about 100 adult Colorado Pikeminnows. Now, ten years later, even adult Pikeminnows cannot be readily found by the scientists and for what natural reproduction does occur, the numbers are very discouraging for those who care about the plight of these endangered fish.

"We are on the verge of completely losing the natural heritage of the San Juan River", says John Weisheit, Living Rivers conservation director, "and unless something is done very quickly the San Juan River will become a graveyard rather than a productive nursery for these unique native fish."

The Bureau of Reclamation (BuRec) has released a Draft Environmental Impact Statement (DEIS) proposing flow modifications for Navajo Dam to help in the recovery of habitat for these native fish species, but this can't work.

The major issue is not flows from the dam, but the loss of habitat and the river's natural dynamic processes. San Juan River endangered fish must be able to spawn high enough in the river channel, such that hatchlings can become sufficiently strong prior to being flushed into Lake Powell reservoir and consumed by non-native fish. "The only way to remedy this situation is to move forward with the decommissioning alternative for Navajo Dam," adds Weisheit.

Also not comprehensively addressed in the DEIS are the issues concerning the traditional medicine people of the Navajo Nation. Says Thomas Morris of the Diné Medicinemen's Association, "Navajo Dam has flooded and desecrated many of our sacred and holy sites. The traditional ways of the Diné have not been respected and these sacred sites must be restored. The traditional people have not been consulted in this public process and we look forward to a future meeting to seriously discuss what is good for the long-term interests of the Diné people, including productive alternatives for the Navajo Indian Irrigation Project and the Navajo - Gallup pipeline.

Other deficiencies in BuRec's analysis include:

- The other critical native fish nursery habitat in the San Juan river was inundated by Lake Powell reservoir. Therefore, a comprehensive Environmental Impact Statement of the decommissioning of Glen Canyon Dam must also be undertaken to properly evaluate recovery options for San Juan River endangered fish.
- BuRec's proposed alternatives were based on experiments that yielded no demonstrated recovery of native fish, and are based solely on meeting water delivery contracts within the San Juan system and to maintain non-native trout habitat for sport fisherman.
- BuRec does not sufficiently evaluate the impacts of potential future diversions on endangered fish habitat. The Animas-La Plata Project, Navajo-Gallup pipeline and further expansion of the Navajo Indian Irrigation Project will significantly reduce flows necessary for recovery of San Juan River endangered fish habitat.
- The decommissioning of Navajo Dam will provide a net financial gain to Federal taxpayers, as the primary beneficiary of Navajo Dam is the Navajo Indian Irrigation Project, which receives subsidies averaging \$1.5 million annually because of the project's inefficiencies.
- BuRec makes no provisions for addressing the predation of native fish by non-native fish such as Catfish and Stripped Bass.
- BuRec makes no provisions for mitigating the impacts on endangered fish habitat from pollutants found in the river, such as PCBs, mercury, DDT, selenium, chlorine and chlordane.

The San Juan River Basin Recovery Implementation Program has failed to restore a self-sustaining native fish population in the San Juan River as it flows through New Mexico, Colorado and Utah, and these new proposals offer more of the same.

Restoration of the river ecosystem can be implemented by simply creating programs that conserve water in our communities and farms. Such programs will save money, taxes and increase productivity while saving the natural and cultural heritage of the San Juan River.

Desalting Plant: Future Still Uncertain

Since it was built in 1977, the Yuma Desalting Plant (YDP) has loomed as the primary threat to the Cienega de Santa Clara, a 14,000-acre wetland in the Colorado River delta that survives on agricultural runoff from the US. Now the Bureau of Reclamation (BuRec) is preparing a report to Congress, nearly two years overdue, regarding the fate of the desalting plant and, with it, the fate of the cienega.

The YDP has never been used due to high operating costs. Were it to be fired up, it would use and divert all the water that currently feeds the cienega. Presently, the costs are still too high to justify operation, even with the intense demand for water in the basin. BuRec itself estimates that desalting water at the YDP would cost an estimated \$318 to \$463 per acre foot. By comparison, subsidized farmers in the area pay as little as \$3.50 per acre foot and most municipalities pay less than \$70 per acre foot.

The first draft of BuRec's report recommends that the cienega's water be offset at this time with such options as: "leasing water from willing sellers, investing in advanced irrigation techniques to reduce use, or obtaining non-systems supplies from groundwater and other sources." Although fiscal concerns are the paramount reason for the recommendation, Living Rivers and other advocates have made the cienega enough of an issue that its survival is noted as a benefit to keeping the YDP mothballed. Living Rivers is also pointing out that decommissioning the plant altogether could save taxpayers an additional \$5 million annually. BuRec is planning to incorporate this input into the next draft of its report.

LR in the News 10/02/02

Citizens oppose draft statement proposal to protect fish

By Laura Banish/Staff writer for Farmington Daily Times

FARMINGTON Objection to a federal water-flow plan was expressed loud and clear by local citizens at a public hearing Tuesday at the Farmington Civic Center.

The Draft Environmental Impact Statement proposed by the Bureau of Reclamation provides seven alternatives for operating Navajo Reservoir. Also included are the potential effects of implementing the proposed flow recommendations necessary to provide sufficient releases of water at the times, quantities, and durations necessary to conserve two endangered fish species native to this area, the razorback sucker and the Colorado pikeminnow.

The document was prepared in compliance with the National Environmental Policy Act. The recommendations were provided by the San Juan River Basin Recovery Implementation Program.

"I have received numerous calls about the statement and none of the concerns are positive," said Commissioner Karen Stevens, of the State Game Commission. She said she attended the meeting to express her worry that the proposed water flow rates will hurt local fisheries.

Stevens was not alone in addressing the concerns for fishing industry, with representing the fishing community being the most verbal at the meeting.

"I have an objection to the whole thing. It took seven years to study, three years to compile, and I can't make sense of it," said Tim Jimmerman, of the San Juan Fly Fishing Association.

He said he did not believe any of the alternatives would save the endangered fish, and that the new release levels would decrease populations of other fish in the San Juan River.

Jimmerman argued that by harming fish such as trout, the BOR's recommended water flows would kill not only the fish, but the area's fishing industry as well.

Farmington city attorney Jay Burnham said he agreed that the new flow releases could have an unfavorable effect on recreational uses of the river and cause economic hardships for those who profit from the industry.

Burnham said the city has submitted information regarding how the flow levels will impact hydropower in the area. He said that although he has not reviewed the statement extensively, it appears the flow rates will reduce the effectiveness of Farmington's hydroplant, and thereby have a negative impact on both water and air quality.

If there was anyone in the audience who should have been in favor of the impact statement, it would have been the two men representing the endangered fish, who attended the meeting dressed as the species they were defending, but even they were against it.

"This whole issue about pretending to care about the fish is a complete charade," said Owen Lammers, who spoke on behalf of the razorback sucker, and the fish conservation group Living Rivers. Lammers, and his partner in trying to save the two species, John Weisheit who was dressed as a Colorado pikeminnow argued that the water flows would not benefit anyone's interests, and the only way to save the fish is to decommission the Navajo Reservoir altogether.

"Attempting to manipulate nature will always fail," Lammers said. He said that if the bureau truly has intentions of saving the fish, they will abolish operation of the reservoir and dam.

BOR representatives said the idea of decommission is both unreasonable and impractical.

Of the 23 people who voice their views, only one man was in support of the alternative suggested by the BOR.

"No one sees the big picture. Everyone has to take a cut in one respect or another, and while it's hard to defend the BOR, this is the best alternative," said Stanley Pollack, who serves as legal water counsel for the Navajo Nation in Windowrock, Ariz.

He said that of the seven alternatives, one must be selected, and the water release rate plan preferred by the BOR is the best one in respect to satisfying the needs of everyone with interests in the reservoir.

The BOR's preferred alternative for protecting the endangered species in addition to meeting other requirements of the dam, is the 250/5000 plan. Under this strategy, releases would range between 250 and 5000 cubic feet per second on a case-by-case basis. Bureau representatives said the modifications would help the fish and enable water development to occur in compliance with applicable laws, compacts, decrees, and Native American trust responsibilities.

"This reaction is pretty much what I expected," said Ed Warner, BOR resource division chief. He said that of the three public hearings scheduled in the Four Corners area this week, he anticipated San Juan County residents to voice the most heated objections. Other meetings will be held today in Durango, Colo., and Thursday in Bluff, Utah.

Aside from dissatisfaction with particular sections of the impact statement, one of the most frequent complaints was that there was not enough time to examine the 600-page document.

The draft was released for a 60-day public comment period beginning Sept. 3.

Warner said that while he could not make guarantees, an extension of the review period may be considered.

As of now, the bureau will accept written comments from the public until Nov. 4., and a final draft of the statement is expected to be finished by April 28, 2003.

The draft in its entirety can be viewed on the bureau's Web site at www.uc.usbr.gov

SAVE GRAND CANYON FROM GLEN CANYON DAM

**COMMENTS NEEDED BY
NOVEMBER 1, 2002!**

Glen Canyon Dam is causing tremendous harm to the Colorado River in Grand Canyon National Park. All native insect species are gone, as are four of eight native fish, otters, muskrats, and the native vegetation in high water zones. There are two public comment opportunities underway until November 1, 2002 that Living Rivers hopes you will consider taking part in.

- [Grand Canyon National Park is undertaking a revision of its Colorado River Management Plan](#)
- [The Bureau of Reclamation is proposing new experimental operating guidelines for Glen Canyon Dam.](#)

Neither of these programs are seriously addressing the needs to remedy the harm brought to Grand Canyon's river ecosystem by Glen Canyon Dam. Please click on one or both of these topics to learn more and where to direct your letters.

Help Protect Colorado and San Juan River Native Fish

COMMENTS NEEDED BY DECEMBER 4, 2002!

The Bureau of Reclamation is accepting public comments on plans to reoperate two of its dams with the objective to restore habitat for Colorado and San Juan River native fish. Unfortunately, neither of these plans will do an adequate job, and without your help these most unique of desert fishes will be headed further down the path to extinction. Please consider lending your comments to one or both of these dam reoperation plans.

Click on the appropriate issue for further details.

- [Reoperation of Navajo Dam](#) on the San Juan River to aid in recovery of endangered Colorado pikeminnows and razorback suckers in the San Juan River between Navajo Dam and Lake Powell reservoir
 - [Reoperation of Glen Canyon Dam](#) to aid in recovery of endangered humpback chub in Grand Canyon National Park

RRFW Riverwire - PIPELINE PROPOSED AT BADGER RAPID

October 8, 2002

Grand Canyon National Park could be opened up for a major water development to collect, pump and pipe water from the Colorado River to the Black Mesa and Kayenta coal mines in northern Arizona in a last minute change to legislation sponsored by Senator Jon Kyl. A pipe would be constructed down Jackass Canyon to draw water at Badger rapid. The Bureau of Reclamation is expected to announce soon a proposal for a water pumping and pipeline project. Full environmental review would not be required, according to another of the bill's changes.

"This is an extraordinary invasion of Grand Canyon National Park which clears the way for tearing up the shoreline, building water treatment and pumping plants, and constructing a pipeline in one of the world's greatest natural areas," said Rob Smith, Southwest Representative for the Sierra Club in Phoenix. "The Colorado River belongs in Grand Canyon National Park, not in a coal slurry pipeline."

Unrelated legislation seeking to resolve water rights for the Zuni Tribe and other water users on the Little Colorado River – S. 2743 – was introduced by Senator Kyl in September after four years of negotiations without any Grand Canyon water project provisions. But a new section was quietly added to the bill in Senate Indian Affairs Committee last week to provide water for a pipeline to the coal mines from the Grand Canyon without any notice or public hearings on the issue.

"The Grand Canyon water project has nothing to do with settling the Zuni's water rights, and should be removed from this bill," said Smith. "There are other alternatives to solving the Hopi's water problems which don't involve sacrificing the Grand Canyon to the coal industry."

The amended bill authorizes water to be leased to Salt River Project (SRP) and removed from the Colorado River "between Lake Mead and Lee Ferry" to be used "only for mining related purposes...and for slurring coal from the Black Mesa and Kayenta Coal Mines."

SRP operates the Navajo Generating Station near Page, Arizona, which gets coal from the Kayenta mine, and is partial owner of the Mohave Generating Station at Laughlin, Nevada, which currently uses water from an underground aquifer to slurry coal from the Black Mesa mine to the power plant. The Hopi Tribe has opposed pumping more underground water for the coal slurry because springs and streams have dried up on the reservation.

RRFW Riverwire - PIPELINE LANGUAGE STRICKEN

October 9, 2002

You did it! Good work!

Thanks for your help on killing the Grand Canyon pipeline deal of an otherwise acceptable--and unrelated--water settlement with the Zuni Tribe!

Title II was the offending section, and the state's Senator has stricken the pipeline language from this legislation. The Senate offices ask that folks cease calling. Water law appears to prohibit Arizona water to be used for a Nevada power plant. Also, any water used in lower basin states must be drawn from below Lees Ferry, which is the dividing line.

While Senate staffers argue that the language doesn't actually authorize construction, it opens the door to a very bad idea, and why create the opportunity if the project should never be built in the Grand Canyon?

Stay tuned. Peabody and the Salt River Project are still trying to work out the water deal somehow to benefit the Mohave power plant and keep the Black Mesa mine open. Likely, this concept has not been killed, just delayed.

LR Press Release 10/10/02

Announcing Colorado Riverkeeper Inaugural Patrols Getting Underway This Week

Contact:

John Weisheit, Living Rivers: 435-259-1063; mobile, 435-260-2590
Alisa Hilfinger, Waterkeeper Alliance, 914-674-0622, x208

The international Waterkeeper Alliance of New York and Living Rivers of Arizona and Utah, announced today the establishment of Colorado Riverkeeper, the first on-the-water advocacy and restoration program for the Colorado River watershed.

With rafts, canoes and kayaks, Colorado Riverkeeper will be patrolling the watershed to better document the growing violations of federal environmental laws caused by dams, diversions and excessive water consumption, and use these findings to support litigation strategies to have these laws enforced.

Colorado Riverkeeper will also be mobilizing the basin's extensive commercial and private river running community to take part in advocacy programs to ensure enforcement of environmental laws and to return the natural ecological viability to the Colorado River watershed.

"We're delighted to have joined forces with Living Rivers to advance this rapidly growing model of river advocacy in the watershed that National Geographic described last month as one of the most troubled water sources in the world," said Robert Kennedy, Jr., president and founder of Waterkeeper Alliance. Since 1999 Waterkeeper Alliance has helped form a network of nearly 100 similar water advocacy programs in the US and abroad.

"Waterkeeper's arrival on the Colorado couldn't come at a better time considering the rapidly advancing decline of its unique desert river habitat," says John Weisheit, who will head up the Colorado Riverkeeper program for Living Rivers. "Their network's incredible track record of on-the-water advocacy and precedent-setting litigation on behalf of rivers and aquatic ecosystems across the country is something we fully plan to continue here on what has become the most developed river system in the country."

Colorado Riverkeeper's initial priority will be addressing major violations of the Endangered Species Act caused by a system of more than 40 major dams. The Colorado River through Grand Canyon National Park, for example, has had its native ecosystem destroyed due to the operations of Glen Canyon Dam. The river corridor's entire food web has been transformed, four of the eight native fish species are now extinct, and otters and muskrats can no longer survive.

"I first rafted the Grand Canyon nearly forty years ago, and am appalled that the US Bureau of Reclamation and other federal agencies have allowed the ecological integrity of this internationally acclaimed river corridor, and designated World Heritage Site, to be so severely devastated. Just like the return of the Peregrine Falcon and California Condor to the Canyon's skies, it's now time to ensure the recovery of endangered species to the Canyon's river," adds Kennedy.

Colorado Riverkeeper launched its first patrol of the Colorado River in Grand Canyon on Tuesday, and Friday a patrol will be launched that will cover sections of the Green and Colorado Rivers above Lake Powell reservoir.

Temperature Rising: Modifications Proposed for Glen Canyon Dam

In an attempt to finally honor the 1994 recommendations of the Fish and Wildlife Service concerning the endangered native fish in Grand Canyon, the Bureau of Reclamation (BuRec) is considering constructing a mechanism to increase the water temperature released from Glen Canyon Dam.

The purpose of this modification is to warm the water sufficiently to stimulate the reproduction processes of these desert fish in Grand Canyon National Park. The proposed temperature control device (TCD) would provide a mechanism to draw water from near the surface of the reservoir where the water is consequently warmer. When the TCD was first proposed in 1999, concerns were raised by the scientific community

about how non-native fish (for example, striped bass) from Lake Mead or Lake Powell reservoirs could affect newly hatched endangered fish.

Another concern is that the warmer water will alter the food base. Glen Canyon Dam has changed the river's natural warm-water food base into an exotic, cold-water food base. It will take time for the ecosystem to respond to the warmer water, which could cause subsequent food shortages for the endangered fish.

There are a total of eight vertical intake tubes that feed water to the generators at Glen Canyon Dam. It has been proposed that five of the eight tubes be retrofitted to include a total of three intakes on each tube, the main intake 230 feet down, another near the top of the reservoir, and the third in between. The total cost is estimated at 60 million dollars. Environmental review is moving forward with a final decision to be made around October of 2003.

"We are confident that this experiment will work and I support this endeavor wholeheartedly," says Wayne Cook, executive director of the Upper Colorado River Commission. "The only way we will know that success can be achieved is to build the infrastructure and to see how the ecosystem responds. If it works, then the money was well spent." Concerned citizens who have been monitoring the efforts to save Grand Canyon's endangered fish are not convinced that such an adaptive mitigation plan will work satisfactorily.

Says David Haskell, former science director of Grand Canyon National Park, "The water temperature leaving the dam is 30 degrees below optimal for successful reproduction of endangered humpback chub. It is highly unlikely that the TCD, as envisioned by BuRec, will be able to raise the water temperature enough to benefit the survival of the chub. The time needed to design, build and test this device will take several years—years the humpback chub may not have."

Living Rivers Currents 10/11/02

Pipeline Proposed to Divert Water from Grand Canyon

In early October, Arizona Senator John Kyl attempted, unsuccessfully, to secure Congressional authorization for the construction of a major pumping plant and pipeline from the Colorado River in Grand Canyon National Park. The water would principally be used to slurry coal from the Black Mesa coal mine on the Navajo and Hopi reservations to the Mojave Generating Station coal-fired powerplant near Laughlin, Nevada. Coal is presently being slurried from the mine with groundwater from the two reservations. This, however, is significantly depleting the drinking water resources for the Hopi tribe, which desires an alternative water source or mechanism to be used to transport the coal. While Kyl did not succeed during this session of Congress, the concept remains alive

and well, as the Bureau of Reclamation told Living Rivers Currents that it was preparing a feasibility study for such a pipeline.

The proposed site of extraction, Jackass Canyon, lies eight miles below Lee's Ferry, where Grand Canyon river runners begin their expeditions. The facility would pump nearly 3,000 gallons per minute from the river, up 1,000 feet, and then eighty miles across the Navajo Reservation to the Black Mesa coal mine.

California condors can often be found perched on both sides of the Colorado River at its confluence with Jackass Canyon. Over the past decade public and private efforts have aggressively worked to maintain a successful reintroduction program for this endangered species. Jackass Canyon also contains one of the few sets of dinosaur tracks known to exist in Grand Canyon National Park. Despite these potential impacts, Senator Kyl's proposed legislation would have exempted this project from environmental review as required by the National Environmental Protection Act.

Living Rivers Currents 10/11/02

Habitat Security Back in Action

Living Rivers' Habitat Security Force was called into action again this month, challenging the Bureau of Reclamation's (BuRec's) misguided proposals for improving habitat conditions for native fish in Grand Canyon National Park and on the San Juan River below Navajo Dam. At meetings in Farmington, New Mexico and Flagstaff and Phoenix, Arizona, Living Rivers expressed concern that BuRec is continuing to demonstrate a lack of any serious interest in recovering endangered native fish in the Colorado River watershed.

As the only advocates for native fish amongst the 50 participants in the Farmington meeting, Living Rivers made it clear that nothing short of decommissioning Navajo Dam could yield any significant recovery. "This is nothing but make-believe," Living Rivers executive director Owen Lammers told the crowd. "The necessary distance in natural flowing river miles for native razorback suckers and Colorado pikeminnows no longer physically exists because of Navajo Dam upstream and Glen Canyon Dam downstream." The river current flushes any young native fish into Lake Powell, where they are consumed by non-native fish before having a chance to mature. Native fish either need the opportunity to spawn back in their native habitat above Navajo Dam, or Lake Powell must be drained for successful recovery to occur.

The majority of other remarks made at the hearing concerned impacts of any operational changes on the non-native recreational trout fishery below the dam. "The razorback sucker has lived here for thousands of years; it will figure out how to survive, but we need to protect the trout," one commercial fishing guide stated.

BuRec's Glen Canyon Dam public meetings in Phoenix and Flagstaff the following two days were huge blemishes for citizen participation. With barely one week's notice, and no advance copies of its environmental assessment available for the public to review, less than a dozen people not directly involved with BuRec's activities attended the combined meetings. "These meetings represented the first opportunity in years for the public to learn about and comment on BuRec's plans for Glen Canyon Dam and Grand Canyon, and they succeeded in doing everything possible to keep the public out," adds Lammers.

At issue were new flow recommendations from Glen Canyon Dam to help conserve sediment and disrupt non-native fish reproduction, so as to benefit recovery of the sole remaining population of humpback chub in Grand Canyon. BuRec is also planning to remove up to 20,000 non-native trout near the humpback chub rearing areas to reduce predation. With humpback chub populations down to just 2,000 fish, Living Rivers pointed out that such efforts are too little too late, and more aggressive measures need to be reviewed.

Somewhat surprisingly Randy Peterson, director for BuRec's Glen Canyon Dam Adaptive Management Program, was publicly combative toward Living Rivers representatives, stating, "Your rhetoric is not helpful...your views irrelevant," and "you should check your [dam decommissioning] baggage at the door." BuRec is clearly becoming increasingly frustrated with the growing public concern for its lack of progress, and its resistance toward doing the bare minimum as required by the Fish and Wildlife Service (see reverse side).

There is still time for the public to weigh in with written comment on both these issues until November 1, 2002. Contact Living Rivers or visit our website for details.

Living Rivers Currents 10/11/02

Dam Flows Fail to Help Grand Canyon Native Fish

In 1994 the Fish and Wildlife Service (FWS) recommended that Glen Canyon Dam be operated in a manner more consistent with the Colorado River's natural flow regime in order to protect native fish in Grand Canyon. The Bureau of Reclamation (BuRec) ignored these recommendations and implemented an operating regime that would provide greater benefits for hydroelectric power production. Now, in a new report released on September 30, 2002, FWS in association with Northern Arizona University again recommends the critical need for dam operators to heed FWS' 1994 recommendations.

Titled *Monitoring and Research: The Aquatic Food Base in the Colorado River, Arizona During 1991-2001* the 225-page report stated, "We recommend a decade of the Seasonally Adjusted Steady Flow alternative, with spring beach building flows as climate permits....We feel these flows in combination with alien fish suppression and

thermal modification of GCD (Glen Canyon Dam) could make Grand Canyon a sanctuary for native fishes of the Colorado River basin.”

BuRec claimed that its preferred operating plan, known as Modified Low Fluctuating Flows, would potentially generate a major increase in the Canyon's aquatic food base, but according to the report, this has not happened and, in fact, the food base is very unstable. "The food base responds negatively to peaking hydropower flows and therefore, this same response applies to native fish and their habitat.”

With native humpback chub populations down 75 percent during the study period, it's quite clear that BuRec's efforts are failing. But despite this science-based validation of FWS's 1994 recommendations, no immediate actions by BuRec are being contemplated, just more experiments.

Living Rivers Currents 10/11/02

Colorado Riverkeeper Launched at Living Rivers

The international Waterkeeper Alliance of New York has selected Living Rivers to establish the first on-the-water advocacy and restoration program for the Colorado River watershed. With rafts, canoes and kayaks, Colorado Riverkeeper will be patrolling the watershed to better document the growing violations of federal environmental laws caused by dams, diversions and excessive water consumption, and use these findings to support litigation strategies.

Colorado Riverkeeper will also be mobilizing the basin's extensive commercial and private river running community to take part in advocacy programs to ensure enforcement of environmental laws and to return the natural ecological viability to the Colorado River watershed.

“We're delighted to have joined forces with Living Rivers to advance this rapidly growing model of river advocacy in the watershed that National Geographic described last month as one of the most troubled water sources in the world,” said Robert Kennedy, Jr., president and founder of Waterkeeper Alliance. Since 1999 Waterkeeper Alliance has helped form a network of nearly 100 similar water advocacy programs in the US and abroad.

“Waterkeeper's arrival on the Colorado couldn't come at a better time considering the rapidly advancing decline of its unique desert river habitat,” says John Weisheit, who will head up the Colorado Riverkeeper program for Living Rivers. “Their network's incredible track record of on-the-water advocacy and precedent-setting litigation on behalf of rivers and aquatic ecosystems across the country is something we fully plan to continue here on what has become the most developed river system in the country.”

Colorado Riverkeeper's initial priority will be to complement the work Living Rivers is undertaking to document violations of the Endangered Species Act caused by the Colorado's system of more than 40 major dams. The Colorado River through Grand Canyon National Park will of course be a major priority. The river corridor's entire food web has been transformed, four of the eight native fish species are now extinct, and otters and muskrats can no longer survive.

"I first rafted the Grand Canyon nearly forty years ago, and am appalled that the US Bureau of Reclamation and other federal agencies have allowed the ecological integrity of this internationally acclaimed river corridor, and designated World Heritage Site, to be so severely devastated. Just like the return of the peregrine falcon and California condor to the Canyon's skies, it's now time to ensure the recovery of endangered species to the Canyon's river," adds Kennedy.

Colorado Riverkeeper launched its first patrols the week of October 7, with one traveling down the Colorado River through Grand Canyon and the other down the Green River through Canyonlands National Park and Cataract Canyon, finishing on Lake Powell reservoir. Overall, Living Rivers' Colorado Riverkeeper program will be establishing a network of patrols spanning over 1,000 miles, including sections of the Green, San Juan and Yampa Rivers, as well as the Colorado mainstem. To participate in the Colorado Riverkeeper program, including traveling on one of the patrols, contact John Weisheit at Living Rivers.

River News 10/14/02

RRFW Riverwire - NO MORE FREQUENT FLOATING?

Sources indicate that planners in the River Permits Office in Grand Canyon National Park may be considering yet another avenue to limiting the number of trips taken by self-guided boaters not on the waiting list to one trip in a given period.

This new rule, if imposed, would apply only to exactly those participants who can help make trips safer, richer in Canyon lore, and more environmentally aware; that is, non-commercial boaters who have been down the Grand Canyon before.

At the same time, the Park continues to discriminate in favor of commercial guests (who can go as many times as they can afford in time and money), and in favor of commercial employees, who are, of course, the most frequent users of the river, and who are not barred from using non-commercial slots for themselves even if they have taken several commercial trips that same year.

There are already 2 rules that limit repeating a trip: 1. Non-commercial participants may take only 1 trip while they are on the waiting list (a minimum of 12 to about 20 years). 2. Anyone unlucky enough to be included on a trip in which the permit passes from the

original to an alternate trip leader will be thrown off if they have made a non-commercial trip in the past 4 years, including the alternate trip leader.

The timing is troubling: Is GCNP suggesting changes that are plainly biased in favor of commercial operations just as the CRMP process is getting underway? This kind of pro-commercial rule proposal erodes public confidence in the Park's ability to produce a river plan that will benefit anyone but the river industry and its wealthier clients.

According to the statistics furnished on the River Permit Statistics handout (www.nps.gov/crmp), repeaters filled about 19% of the trips slots during the nearly 4 years from 4-98 to 1-01. Similar data for commercial operations do not appear on Park handouts, but information from the mid-nineties shows that commercial crew fill 18% of commercially-launched seats. That is, the experienced-to-passenger ratio is about the same for both commercial and non-commercial trips.

Unfortunately, even Draconian new rules may not move the waiting list much faster. If trip vacancies are filled by non-repeaters, there will be no change. Of course, to keep expenditures down, cost-sharing non-commercial trips that lose a passenger or two will try to find replacements--if time allows. But even if those vacancies are not filled, rough calculations indicate the wait could be shortened by four years or less from the current 19+ years by turning the user days into new permits.

Having an experienced Grand Canyon passenger on your trip list sets you up for possible GCNP rule changes aimed at reducing your choice of companions as well as your safety and enjoyment, in the slim hope that these "forced cancellations" might create space for some more trips. Some non-commercial trips would go with less-than-optimal qualifications, increasing the chance for situations in which NPS and commercial staff can criticize the conduct of non-commercial trips. Additionally, there could be a huge increase in cancellations if permittees feel unqualified to conduct their trips with little or no experience, and therefore cancel their trips.

RRFW sincerely hopes this information is incorrect and such a new rule is not being considered.

RRFW has also heard that about 300 unused commercial user days may be turned over to the do-it-yourself sector this year according to the terms of the court settlement agreement.

LR Press Release 10/30/02

**Glen Canyon Dam experimental flows a waste of public resources
New Environmental Impact Statement needed to address dam decommissioning**

Contact: John Weisheit (435) 259-1063

In a [letter](#) delivered today to the Bureau of Reclamation (BuRec), Living Rivers demanded the agency abandon its proposed experiments aimed at restoring endangered fish habitat in Grand Canyon National Park.

"It's unbelievable that BuRec is attempting to feed the public such pseudo-science as a recipe for fixing the mounting problems Glen Canyon Dam is causing to Grand Canyon National Park," said John Weisheit, Living Rivers conservation director.

Earlier this month, BuRec released an environmental assessment outlining new experimental operating criteria for Glen Canyon Dam. Living Rivers' letter emphasized that one of BuRec's main goals, to improve habitat conditions for endangered fish by transporting sediment, is dead on arrival.

- For the past three years there has not been sufficient sediment in the Paria River to warrant the proposed experimental operations.
- Even were such sediment available, it is not enough to counteract the loss of 95% of Grand Canyon's sediment and nutrients now trapped behind Glen Canyon Dam.
- The timing BuRec has selected for its special habitat flows is five months in advance of when native fish could benefit. Most of the habitat created would be eroded away by the time young fish might be available to use it.

"If BuRec were serious about addressing the sediment problem, it would be discussing how to get more sediment from behind the dam into the system, not merely proposing flow regimes for sediment that is no longer there," adds Weisheit.

Living Rivers' letter also points out how BuRec's continued unwillingness to honor the opinion of the Fish and Wildlife Service represents a major reason why the endangered fish population in Grand Canyon National Park continues to decline. A recent report issued by the Service reiterates its 1994 recommendation that flows into Grand Canyon National Park from Glen Canyon Dam more closely mimic the river's natural flows. BuRec has been unwilling to implement such recommendations due to resistance from hydropower interests.

Because endangered Humpback Chub populations have declined so precipitously over the past decade, down to just 2,000 adult fish, and that four other native fish along with otters and muskrats have now disappeared from Grand Canyon's river corridor, Living Rivers is calling on BuRec to immediately undertake a full Environmental Impact Statement on Glen Canyon Dam's impacts to Grand Canyon, including the evaluation of the dam's decommissioning as one alternative to achieve habitat restoration in the Canyon.

LR Letter 10/30/02

Comments on Glen Canyon Dam experimental flows

Mr. Randall Peterson

Bureau of Reclamation, Upper Colorado Region

125 South State Street, Room 6107

Salt Lake City, Utah 84138-1102

Via Fax: 801-524-3858

Re: Proposed Experimental Releases from Glen Canyon Dam and Removal of Non-Native Fish, Environmental Assessment

Dear Mr. Peterson,

Living Rivers appreciates this opportunity to submit the following comments on the Environmental Assessment (EA) concerning proposed experimental releases from Glen Canyon Dam and removal of non-native fish from Grand Canyon National Park, September, 2002.

Living Rivers is keenly aware of the rapidly declining Humpback Chub populations, as well as other Grand Canyon native fish species, caused by the operations of Glen Canyon Dam. While the purpose of this EA is in response to the need to modify the operations of Glen Canyon Dam and to test methods to mitigate these impacts, the proposed actions, especially as they pertain to sediment retention and habitat-building, are fundamentally flawed. Of critical concern, this EA does not evaluate any alternatives for meeting sediment needs blocked by Glen Canyon Dam into the Grand Canyon river corridor.

Adequate attention to sediment retention and augmentation experiments for native fish in Grand Canyon necessitates a full Environmental Impact Statement (EIS) not the cursory analysis undertaken in this EA. Such an EIS must fully evaluate the decommissioning of Glen Canyon Dam as an alternative. The need for such an EIS stems far beyond the issue of sediment, but to all aspects of the dramatic decline in Grand Canyon Humpback Chub populations. The reduction to just 2,000 adult Humpback Chub constitutes significant and new information to that which was evaluated in the 1994 Fish and Wildlife Service Biological Opinion, and 1996 Final EIS on Glen Canyon Dam operations.

Lastly, as stated in our letter of September 25, 2002, the public review process for this proposed action has been wholly unsatisfactory. The Bureau of Reclamation (BuRec) and its Adaptive Management Program for Glen Canyon Dam (AMP) must overhaul its procedures for public participation.

1. No sediment to justify experimentation

The EA focuses on utilizing experimental flows from Glen Canyon Dam to manage sediment for the benefit of Humpback Chub populations. However, there has been, and

may not be during the proposed experimentation period, much sediment to manage. Thus, such experimentation may not occur at all. Ninety five percent of the historic sediment load for Grand Canyon native fish remains trapped in Lake Powell reservoir. In the best of conditions, such experiments as proposed in the EA, could manage only five percent of what would exist in natural conditions. However, this five percent has not proven sufficient to provide the turbidity and food base needs for the Humpback Chub. Furthermore, recent sediment inflows from the Paria River, the principle source for this remaining five percent (and the proposed experiments), have been the lowest since 1923. The EA did not report this. Such sediment inflows are not sufficient to allow for the proposed experimentation, and thus will in no way benefit the Humpback Chub.

Sediment is a key missing component for advancing the recovery of native fish in Grand Canyon (Rubin, et. al., EOS v83, n25, 2002). However, the EA focuses on flow releases to transport the sediment without insuring the availability of sufficient sediment to aid recovery. BuRec must therefore address through an EIS process methods to augment the remaining sediment inflows.

2. Climate change and the associated effects on long-term habitat improvement

The EA ignores climatic factors that will effect the proposed experimental releases. As noted above, without significant sediment augmentation the anticipated input of sediment and nutrients for the Colorado River main stem in Grand Canyon may not occur. Scientists from the US Geological Survey (USGS) have reconstructed the historic climate conditions for the Colorado River basin. Their reports indicate that a sustained severe drought could lie before us and that such a climate regime would jeopardize resource management challenges. (Hereford and Webb, 2002).

Another climatic factor that inhibits the proposed conservation strategies is below normal levels for Lake Powell reservoir; specifically reservoir levels set below the spillway portals. Presently, the spillway portals are perched above the reservoir, which will not provide for experimental flows above 45,000 cfs. If below average inflows into Lake Powell reservoir continue, resulting in additional elevation decreases, maximum discharge could be reduced an additional 50 percent or more. Such discharge rates would be ineffective to transport sediment as called for in the EA, even were such sediment available for transport.

3. Timing of spike flows and sediment deposition will provide no benefits to native fish rearing

Under ideal circumstances, fall sediment inflows from the Paria River will be conserved through low flow dam releases until January, at which time a spike flow is to occur in an effort to build beaches and habitat for the rearing of Humpback Chub. However, previous experiments have revealed that much of this habitat disappears within six months of the spike flow. Since rearing Humpback Chub would not be available to utilize such habitat until five months following the spike flow, it makes little sense to time such flows so far in advance. To be of any benefit, such spike flows should be timed to coincide with the natural high flows entering Lake Powell reservoir.

4. Proposed flows ignore Fish and Wildlife Service opinion for the recovery of Humpback Chub

The EA states that the present flow regime from Glen Canyon Dam (Modified Low Fluctuating Flow or MLFF) has failed to benefit the habitat of the Humpback Chub. This conclusion came from data provided by the Grand Canyon Monitoring and Research Center (GCMRC) (Coggins and Walters 2001), which concludes that a dramatic reduction in the Humpback Chub population has occurred since this flow regime was implemented.

This flow regime was selected as the preferred alternative by the Secretary of Interior despite objections by the Fish and Wildlife Service FWS in its 1994 Biological Opinion. That opinion specifically stated that the MLFF alternative would "likely destroy or adversely modify designated critical habitat." FWS recommended the alternative known as the Seasonally Adjusted Steady Flow (SASF). FWS in conjunction with the Department of Biological Sciences at Northern Arizona University, reiterated these recommendations in their September, 2002 report, Monitoring and Research: The Aquatic Food Base in the Colorado River, Arizona during 1991-2001 (Benenati, et. al.). This report states, "We recommend a decade of Seasonally Steady Flow alternative, with spring beach building flows as the climate permits and unlimited hydropower ramping within 10% of the predicted seasonal mean. We feel these flows in combination with alien fish suppression and thermal modification of GCD could make Grand Canyon a sanctuary for native fishes of the Colorado River basin."

The proposed experimental releases outlined in the EA will continue to conflict with these recommendations in two ways. First, as noted above, the habitat-building releases do not occur at the preferred time-period of the annual, historic snowmelt, to which these native fish are naturally attuned. Second, the prescribed fluctuating flows for non-native fish suppression would disrupt the food supply for the native fish species. Additionally, the EA does not sufficiently analyze the impacts to other habitats, with their associated species, caused by experimental releases inconsistent with the river's natural hydrograph.

5. Supplemental EIS needed

The proposed actions in this EA, either separately, or in combination with other actions contemplated by BuRec and AMP, are not seriously addressing the precipitous decline of endangered Humpback Chub in Grand Canyon National Park. This decline, described by Coggins and Walters, while not surprising given lack of management activities on behalf of the Chub, was not anticipated when the Record of Decision was signed. The population has been considered to be fairly stable over the last decade or more. Therefore, under National Environmental Policy Act (NEPA) regulations found at 40 CFR 1502.9(c)(1)(ii), these new data represent "significant new circumstances or information relevant to environmental concerns," triggering a requirement to prepare a Supplemental EIS (SEIS) to the 1996 Glen Canyon Dam EIS. The Bureau of Reclamation, the National Park Service, and other agencies are likely in violation of the Endangered Species Act and the Grand Canyon Protection Act for failing to ensure

protection and recovery of the Humpback Chub population in Grand Canyon National Park. BuRec, in conjunction with National Park Service, and other relevant agencies, should immediately begin work on such an EIS for the full recovery of the Humpback Chub populations in Grand Canyon National Park. Such an EIS must address all issues affecting the Humpback Chub including: temperature, sediment and nutrients, flow conditions and non-native fish impacts. Most importantly, the EIS must evaluate the decommissioning of Glen Canyon Dam as one of the alternatives to meet Humpback Chub recovery objectives.

6. Public review process

BuRec did not fully comply with the spirit of the public review process as outlined by NEPA. Less than ten days notice was given prior to its two public meetings. No notification was mailed out in advance of, or subsequent to, these meetings. As a result, less than a dozen people not directly affiliated with the activities of BuRec or the AMP attended the combined meetings. The EA was not made available to the public in advance of these meetings. With the exception of those few who attended the first meeting in Flagstaff, Arizona, to obtain a copy of the EA, most others were afforded less than 30 days for which to formulate and submit comments.

The AMP is charged to fully involve the general public in its activities. We request that in the future BuRec assert greater diligence in the future concerning public participation and ensure that ample time is given to the public to learn about, and become engaged in, those activities pertaining to the operations of Glen Canyon Dam, and its associated impacts to Grand Canyon National Park.

In conclusion, Living Rivers finds this EA and the experiment proposed pertaining to sediment, an unfortunate waste of public resources. The crisis facing the Humpback Chub in Grand Canyon is quite serious, but it has yet to be taken seriously by BuRec and the AMP. The proposed habitat-building experiment is unlikely to materialize due to lack of available sediment. Even if such sediment were available, it would not be distributed in a timeframe to benefit the Humpback Chub. Regardless, such sediment would be insufficient to mitigate the loss of 95 percent of sediment and nutrients now trapped behind Glen Canyon Dam. This EA further demonstrates BuRec's and AMP's unwillingness to follow the recommendations of FWS, and as a result, will lead to the further declines in the Humpback Chub populations in Grand Canyon National Park. BuRec must abandon this EA and proposed experimentation and conduct a full EIS on new operating regimes for Glen Canyon Dam, including decommissioning, to fully recover endangered fish habitat in Grand Canyon National Park.

Thank you for the opportunity to submit these comments and recommendations.

Sincerely,

John Weisheit
Conservation Director

RRFW Riverwire - CRMP COMMENT DEADLINE TOMORROW

You knew we would be nagging you. The deadline for comments is through the end of tomorrow, Nov. 1st. Urge your friends and family to comment. This is everyone's park!

The email address is: grca_crmp@nps.gov

Please include a sentence on any or all of these topics, or others of your own interest: Grand Canyon National Park must be at the forefront in protecting the ecosystem. The canyon is in catastrophic decline due to the dam upstream. Species are gone or on the brink of disappearing. The park cannot depend upon the Bureau of Reclamation and other government agencies to protect the canyon, but must speak up in its defense.

The park must protect all of the great Park's intact biological communities, natural processes, and archeological treasures. Preserve and protect the wilderness character of the Colorado River unimpaired for future use and enjoyment as wilderness.

The park must provide outstanding opportunities for solitude and a primitive recreational experience--without the use of motorboats. The peace and tranquility should not drown in clamor of crowds or the racket of an outboard motor. Remove motors from the river.

Motorboats are not as safe as oar-powered craft, nor do they provide economical trips as claimed by some river concessionaires. They simply allow corporations to crowd more people onto noisy boats to rush through the Canyon.

The park must end the launching of up to 7 parties a day (only 1 or 2 of these are non-commercial), even out the launches and distribute use throughout the seasons to reduce crowding and congestion along the wilderness river.

There must be a reform of the current concession services and provide fairer access and affordable trips to include a broader representation of citizens. It is grossly unfair that non-commercial river runners must wait up to 20 years to get a trip permit.

The park must eliminate noisy, intrusive helicopter passenger exchanges. The use of helicopters should be limited to life and health-threatening emergencies, or essential administrative imperatives.

RRFW Riverwire – WILDERNESS WITHOUT THE RIVER?

River Runners for Wilderness (RRFW) has recently learned that the Grand Canyon River Outfitters Association, their legal council and staff from the Grand Canyon Trust have been on Capitol Hill, to gather support for a Grand Canyon Wilderness bill that excludes the river.

Tom Martin and Jo Johnson of River Runners for Wilderness took the opportunity while in Washington for the Colorado River Management Plan Scoping Meetings to inform congressional staffers about the progress of the open public CRMP process. Also participating in the informational meetings were members from the Arizona Wilderness Coalition, The Wilderness Society, American Canoe Association and American Whitewater.

Jo Johnson noted “Our purpose was to educate staffers on the Colorado River Management Plan process and ask their help in assuring the process would go forward unimpeded by surprise legislation, as happened when the Hatch Appropriations Rider was passed in 1980. So you can imagine our astonishment when we learned about the river concessionaires activities.” Several congressional staffers confirmed they had been visited one month earlier by the outfitters group and the Trust to gather support for a possible Grand Canyon Wilderness bill that excludes the river.

“We are right in the middle of the most intensive on-going public process for managing the Colorado River in over twenty years, driven by a legal settlement to complete the planning process in time to award new river concessions contracts. It’s alarming that the river concessions would be considering a legislative end run around the public process at this time” noted Tom Martin.

Wilderness Management of the Colorado River in Grand Canyon is whole-heartedly embraced by the American public. Wilderness management is also supported by the Wilderness Act and National Park Service policy. It is unfortunate that wilderness management has been fought at every step of the way by the river concessionaires and their allies. It's clear America wants a river wilderness, especially in Grand Canyon. Wilderness areas in the country strictly control for-profit private business activities, both in minimizing the amount of guaranteed access the private businesses are allowed, and in making sure America's motor free heritage is preserved.

RRFW Riverwire – NEW WESTWATER RESERVATION SYSTEM

Westwater Canyon, a popular 1- to 2- day river trip, will be accessed through a new method of permit issuance this year. Chad Niehaus, Recreation Planner for Bureau of Land Management's Moab River Office explained: "We wanted to reduce cancellations and maximize the available use in Westwater Canyon while making the reservation system more user-friendly".

The website at www.blm.gov/utah/moab/ww-info.html features an online calendar of available launches, updated daily. Prospective permittees may call to reserve their date up to two months before their desired date—the call-in date is conveniently listed for each date. "We tried this on launch dates in the secondary season last year," Niehaus said, "and it worked well enough for us to apply it to the main season."

The previous annual lottery which was held early in the year was apparently not well suited to Westwater Canyon, which requires less planning lead time since it can be run as a day-trip and is a relatively short drive from several metropolitan areas. The cancellation rate was high and the River Office was increasingly forced to phone permittees to find out if permits would be used. Unused spaces were released as available permits, but often with little lead time.

The River Office is hoping to decrease administrative costs of river permitting. "There will still be "crunch" times when the phone lines will be jammed" acknowledged Niehaus, "but overall, this system should work much better for everyone." Westwater's method has not been used before, but if successful, other river permitting agencies may incorporate elements into their own permitting systems. There has been a lot of interest in the details by planners in other locations, according to Niehaus.

River News 11/23/02

RRFW Riverwire - 2002 RIVER INCIDENT UPDATE

The primary river season for the Colorado River in Grand Canyon National Park has drawn to a close. Below is a list of reported river incidents.

Non-commercial river runners reported 9 incidents; six incidents required helicopter evacuation. Three were on-the-water boating accidents, one was an in-camp accident, and two were the result of dehydration. The remaining three incidents were a flash flood in Havasu Canyon that caused minor trauma to 2 individuals who stayed on the river, a runaway from a trip in which poor group dynamics was reported, and a rock slide which caused property damage only.

There were 41 commercial concessionaire river incidents, thirty of which required NPS evacuations. Three were evacuated at the Whitmore Helipad to the Bar-10 Ranch, and went on to Las Vegas hospitals. There were eighteen medical incidents, twenty four trauma incidents, and five incidents categorized as "other". One person was checked by rescue personnel, and was found to be fine.

Also reported on commercial trips were a snakebite, five dehydration incidents (a decline from last year), five day hike injuries, four boat accidents, an in-camp accident, and two people who were injured when they jumped off a boat. There was one river guide fatality. One incident involved a bone that had been collected by a guide and stored for 1 month in an ammo can. A commercial passenger (a doctor) thought the bone to be human and gave it to the trip leader, who turned it into NPS rangers.

The 41 commercial concessionaire river incidents reflect an overall increase from the annual average of 34 incidents.

In addition to incidents handled by GCNP, there were 5 calls for assistance by hikers or non-commercial boaters that were handled by concession crews.

Comments supporting PWC ban on Lake Powell reservoir

Kitty Roberts
Superintendent
Glen Canyon National Recreation Area
Attn: PWC DEIS
P.O. Box 1507
Page, AZ 86040
Via Fax: 928-608-6212

RE: Comments on National Park Service's Draft Environmental Impact Statement and Personal Watercraft Rule-Making for Glen Canyon National Recreation Area

Dear Superintendent Roberts:

Living Rivers respectfully submits the following comments on the National Park Service's Draft Environmental Impact Statement (DEIS) and personal watercraft (PWC) rulemaking for Glen Canyon National Recreation Area (GCNRA).

PWC use is an extremely important issue facing the National Park Service, and GCNRA specifically. Unfortunately, while other Park Service units have addressed it as such, the DEIS reveals a cursory analysis by GCNRA, which lacks compliance with the National Environmental Policy Act (NEPA) process in an effort to justify a preferred alternative that does little to address the concerns which triggered this NEPA process.

1. No data to support conclusions relating to Alternative C.

Throughout the EIS there are references to Alternative C which state "by the end of the ten-year analysis period, most former personal watercraft users would have returned to the recreational area with other motorized watercraft." This unsubstantiated conclusion is used to support the supposition that implementing Alternative C would not significantly affect air quality, water quality, noise, visitor experience, etc. over the medium to long term. The DEIS contains no data or analysis to back-up this prediction. There is, however, data presented in the DEIS that indicates that the opposite can be anticipated, allowing for extensive and permanent reduction of impacts.

Although not stated, but clearly supported in the data presented in the DEIS, is that the overwhelming majority of PWC use at Lake Powell reservoir is associated with the use of other vessels, such as powerboats and/or houseboats. Only a small percentage of PWC users at Lake Powell reservoir employ PWCs as their primary vessel. On page 126 the DEIS states that 32 percent of groups visiting Lake Powell use PWCs, while 84 percent use powerboats and 29 percent use houseboats. It also states that 39 percent of the houseboat groups and 25 percent of the powerboat groups include at least one PWC. This means that 11 percent of the groups on the reservoir have houseboats and PWCs and another 21 percent of the powerboat groups have PWCs. Combined this represents 32 percent of the groups on Lake Powell reservoir—the same figure for PWC groups stated in the DEIS. Because some groups contain houseboats, powerboats and PWCs, this calculation may yield a slightly exaggerated figure. However, the percentage of such three-craft groups is likely rather low, else it would have been included in the data presented in the DEIS. If, as the DEIS states, 32 percent of all groups employ PWCs, and 32 percent—minus some small amount—of all groups use PWCs with powerboats and/or houseboats, it is clear that PWC use is significantly tied to the use of these other watercraft.

Therefore, like waterskis, wakeboards and other recreational equipment, PWCs represent merely one form of recreation associated with the collective activities of groups using other vessels. Permanently banning PWC use does not necessarily mean that these powerboat and houseboat groups will utilize an additional vessel, merely that they will have one less recreational activity associated with their time on Lake Powell reservoir. While many of these users will continue to take part in motorized reservoir activities, there is no data or analysis presented for why these groups will necessarily incorporate additional watercraft to replace PWCs. Nor is there any evidence to suggest that there would be a one-to-one relationship over time to the replacement of PWCs lost with other vessels. Lastly, there is also no evidence to support that the small percentage of groups that only use PWCs will use the reservoir at all, given that their preferred activity is permanently banned.

Absent evidence to the contrary, it is clear that the analysis of Alternative C is significantly flawed, grossly misleading the public as to the actual social and environmental benefits associated with a permanent ban of PWCs on Lake Powell reservoir. A much more likely scenario is that any change in motorized use on the reservoir will occur at a pace consistent with current trends, absent the use of PWCs.

2. Alternatives A and B are arbitrary.

As illustrated in Table 18 on page 131 the areas proposed for PWC restriction in alternatives A & B constitutes low use areas on Lake Powell reservoir by PWCs. These proposals provide limited benefits to the visitor experience relative to more than 190 other side canyons that are to remain accessible to PWCs from Lake Powell reservoir. Such a limited selection is arbitrary and capricious. The fact that these areas may have had PWC restrictions associated with them in the past, should not render them the sole locations for the development of alternatives. Similar problems with noise and competing uses, which represent the primary justification for the presentation of Alternatives A & B, also occur at Navajo, Antelope, Moqui, Lake and many other side canyons inundated by Lake Powell reservoir. These areas must be given equal, if not greater consideration, in the analysis of alternatives, not be systematically ignored.

3. Insufficient justification for eliminating alternatives from further consideration.

Page 61 states that limiting PWC use to the main channel of Lake Powell reservoir would be, "...inconsistent to the objectives of the recreation area as defined in its enabling legislation. The objectives of the recreation area are to manage the area so that it provides maximum recreational enjoyment to the American public and its guests...".

Limiting PWC use to the main channel in no way compromises a visitor's recreational enjoyment. PWCs are not primarily used for transportation to other recreational opportunities/locations on Lake Powell reservoir. As stated in the DEIS, PWCs are "high-performance vessels designed for speed and maneuverability and are often used for stunt-like maneuvers." So long as the Park Service provides for this opportunity at a reasonable number of locations, there would be no conflict with the spirit of the enabling legislation. Furthermore, as the user group analysis in Section 1 above illustrates, the vast majority of PWC users are accompanied by other vessels, therefore they can gain access to all other areas on the reservoir where other forms of power boating is allowed. Lastly, while PWCs may afford access to some areas too small for other vessels, such areas constitute the precise types of locations that generate substantial conflict with non-motorized users, and thus should warrant a ban on PWC access.

4. Only alternative C ensures compliance with federal law.

The National Park Service Organic Act states that Park resources are to be managed so that they remain "unimpaired for future generations." The allowances for PWCs into the GCNRA has indeed caused such impairment. The Park Service attempts to justify PWC use as consistent with GCNRA's enabling legislation. However, the 1972 enabling legislation was not able to predict the evolution of these vessels, and the profoundly negative impact they would have on these "future" generations. Unlike other forms of powerboating on Lake Powell reservoir, PWCs contribute significantly to water, air and noise pollution, and more specifically, to the derogation of the visitor experience throughout the reservoir. The 1978 Redwood Act states that there should be no "derogation" of Park resources, yet GCNRA has taken no steps to restrict this relatively new, and growing source of conflict for visitors to Lake Powell reservoir.

While the 1979 GCNRA General Management Plan's mission may be to "...provide maximal recreational enjoyment to the American public and their guests..." this does not allow for one form of recreation to increasingly detract from others. Maximal enjoyment must allow for a threshold, particularly in light of increasing demands for non-motorized activities in the reservoir's many side canyons. GCNRA may encompass more than 1.2 million acres, but the side canyons and tributaries feeding the reservoir's mainstem are amongst its most spectacular assets and must be managed accordingly. Only Alternative C provides for the management requirements consistent with federal law, and therefore should become the preferred alternative.

5. Lake Management Plan

The DEIS states that within Alternatives B & C that GCNRA will "seek funding for the development of a Lake Management Plan." This should be a component of all alternatives. Moreover, the term "seek funding for" does not provide sufficient assurances that such funding will ever be obtained. GCNRA should make the development of a Lake Management Plan a priority, and commit to getting it done, not merely alluding to it pending the outcome of uncertain resource allocation decisions. Additionally, such a plan must explore placing similar restrictions on powerboats and houseboats as those being contemplated for PWCs.

In light of the above, Living Rivers believes the only viable alternative outlined in the EIS is to make permanent the current PWC ban on Lake Powell reservoir, by implementing Alternative C.

Sincerely,

Owen Lammers
Executive Director

A tale of two dams

Bureau of Reclamation anniversary has special significance in valley

By Joe Rowley for the The Herald Journal

Through several dryer-than-normal years much of the West, and Utah especially, has been trying to keep from choking on its own thirst. And during the past year the U.S. Bureau of Reclamation has been celebrating its 100th anniversary of trying to quench that thirst.

But at the same time, there have been cries raised for rivers to be returned to their natural state and dams to be torn down. Others have simply called for more scrutiny in water development projects. In the middle of it all the Hyrum City Council last month

passed a resolution making clear their support of Bureau of Reclamation projects and their condemnation of those who would tear down the concaved concrete walls.

That resolution raises the question: What is the bureau's legacy in Cache Valley?

Bob Parson, Utah State University Archivist in USU Special Collections takes a personal interest in local water and valley history. He said the bureau has been very active on the Bear River almost from its creation in 1902.

Two water storage projects in the county owe their existence to the Bureau of Reclamation, Hyrum Dam and the expansion of a much older, much smaller Newton Dam. While there have been criticisms of the efficacy of some bureau projects, the two reservoirs here, Parson said, live up to expectations better than most.

That is because the pioneers who settled the valley had already constructed an irrigation infrastructure leaving only the need for greater quantities of water to make the valley more arable. The ditches and canals already dug throughout the valley made it easier to make dams that could efficiently deliver water, Parson said.

The Bureau of Reclamation's stated purpose is making land more arable, or suitable for producing crops, reclaiming the arid lands of the West. But when the bureau was created in the early 21st century there was an agenda behind that purpose: Encouraging people to move West and spread out, said Jay

Henrie, Deputy Area Manager in the bureau's Provo office.

Reclamation projects are spread throughout 17 western states beginning at the eastern borders of Texas, Oklahoma, Kansas, Nebraska and the Dakotas.

Newton Dam especially holds a prominent position in the history of American irrigation, if not merely some interesting insight into the settlement of the valley. Parson said Newton is believed to be the first dam in the state. His statement is backed up by bureau literature on the project, which goes as far as to say that it may have been the first large body of irrigation storage in the nation.

Settlers founded Clarkston early in Cache Valley history and began tapping Clarkston Creek to water their fields. When a splinter group of settlers moved down stream to found New Town, later Newton, they quickly found there was not much water left in the creek when Clarkston people finished with it. So they built a dam to store what little water came downstream, Parson said.

That was in 1872 and the total capacity was only 1,566 acre-feet.

"The new reservoir was woefully inadequate," Parson said. "People began talking about building a bigger dam almost as soon as it was completed."

The bureau turned its eye to expanding Newton as early as 1918, but it wasn't until 1946 that a larger dam was completed a mile-and-a-half downstream. The reclamation project increased the capacity to 5,600 acre-feet.

Before working on Newton the bureau worked on the Little Bear River just south of Hyrum, building the larger of its two projects in the valley. Hyrum Dam was similar to Newton's in that it was the local landowners who really pushed for it, and dissimilar from many projects of today for the same reason.

"Today you can't build a dam because they're too expensive. There's too much mitigation, too many interest groups," Parson said. "In the 1920s there wasn't (all that). It was mainly the irrigators and they all rallied around the cause."

Hyrum Dam's 18,800 acre-feet capacity of water now provide supplemental irrigation to more than 6,300 acres and \$1 million worth of crops, according to bureau data.

Hyrum reservoir acts as an effective catch-basin for spring runoff because of its large drainage area, Henrie said. Nearly 220 square miles above the dam drain into the Little Bear River. The drainage is so large, in fact, that Henrie said it's a rare year when the reservoir doesn't fill up, even during dry spells.

Hyrum Dam is "incredibly successful" as a Bureau of Reclamation project, Parson said. Without Newton Dam, that part of the valley would all be dry farm.

But there are tradeoffs in water storage projects.

Besides the land that gets inundated under a reservoir, the summer-time flow in the river is kept artificially high and turbulent, creating more sediment in the water. Without low-water times when vegetation can move down the bank and secure the dirt with its roots, the river banks erode more quickly, Parson said.

The real criticisms of the Bureau of Reclamation, to which the Hyrum city resolution refers, come from people like Owen Lammers and his Moab-based grassroots action group, Living Rivers.

Lammers accuses the bureau of being unwilling to enter the 20th century. While stopping up rivers and storing water may have been effective in the past, he said that is often no longer the case. The bureau is trying to squeeze more water out of the rivers than they have to give, and in planning future projects the bureau is finding more water on paper than really exists, he said.

Not only that, people better get used to the state they're in now. Lammers said the recent dry spell is really a taste of what normal precipitation levels are and that the West is in for even drier periods. The bureau is doing nothing to address that threat, he said.

"(There's) a huge social reality that we do not have enough water to meet the obligations that the agency is making," Lammers said. "The agency continues to spend its time trying to adapt rivers to meet our consumption. What we really need to begin to do now - because the rivers have no more to give - is adapt our consumption to the rivers."

Lammers also accuses the bureau of being unwilling to adapt to a greater social interest in the environment. When it was created 100 years ago, he said, there was little public concern for environmental and wildlife habitat issues.

Living Rivers promotes large-scale river restoration, including the Colorado River Basin, and is one of the primary groups pushing for the drainage of Lake Powell. Lammers and his group would like to see Glen Canyon Dam decommissioned, along with some other Bureau of Reclamation projects.

Keeping the water in Lake Powell is actually being wasteful because as much as 10 percent of the lake's capacity is lost during the year through evaporation and seepage into the sandstone, Lammers said. If the water were allowed to flow free the full amount would be available for use during the year. Storage for downstream users would not be a problem because Nevada's Lake Mead, held back by the Hoover Dam, is large enough for the purpose.

When it comes to being proactive in water conservation, Lammers said the bureau has a strong authority that it refuses to exercise. As the apparent watermaster of the West, the bureau could mandate planting patterns to support more water-efficient crops. It could dictate what farmers grow with the water it releases, he said.

For example, half of the water released from bureau systems is used to raise alfalfa, which requires 30 times as much water to get one pound of protein for cattle as other sources of vegetable protein, Lammers said. If the bureau mandated cropping patterns that didn't include alfalfa it could free up 35 percent of the water for other uses.

People need to "begin to work in balance and harmony with the system and not continue to pretend that we can technologically cheat it," he said.

"Why can't (the Bureau of Reclamation) take that same creativity and vision that they had to destroy rivers and put it into addressing the current problems of the day," Lammers said.

The Utah Rivers Council offers a more moderate view of the Bureau of Reclamation. Utah Rivers Council Executive Director Zach Frankel makes a distinction in saying that he is not an environmentalist, he is only a member of the public.

"That's why we're not on the Lake Powell thing, that's just not our cause," Frankel said.

His view of the bureau is a federal agency that should be subjected to increased scrutiny. To unilaterally say "the bureau is good" or "the bureau is bad" is not wise, he said. But as a major user of the United States' tax base, Bureau of Reclamation projects should be scrutinized on a case-by-case basis.

A good example of scrutiny can be seen in the recent defeat of the proposed Honeyville and Amalga dams, though they would not have been bureau projects. The two dams were removed from a list of future Bear River projects after farmers and non-farmers alike fought against them. The dams would have covered prime farm land along as

much as 13 miles of the Bear River and would have provided water to only Salt Lake urban communities, Frankel said.

"They weren't tree huggers, they were farmers and ranchers and Shoshone tribe members," Frankel said.

"They were also tax payers. They felt like, 'Why should Salt Lake take Box Elder and Cache counties' water when the farmers depended on it for their lifeblood?'"

While those and other dams may not be in the best interest of the community, there are others that are, Frankel said. There is a large difference between the proposed Honeyville and Amalga dams and the Hyrum and Newton dams, he said.

"Hyrum Reservoir is a different beast. Farmers need water to irrigate and people need food to eat," he said.

What really needs to be done is create more dialogue in water development, Frankel said, rather than allowing one federal agency to make all the decisions.

Henrie said the bureau has altered some of its practices since 1970 to meet the change in public interest. What used to be projects coordinated between the local entity and the federal government has now begun to involve more public input, he said.

As for Cache Valley, there will be no more Bureau of Reclamation projects here. Anywhere the bureau works, it is there at the invitation of the state, Henrie said. Thirty years ago Utah lawmakers decided the state should take charge of future water development on the Bear River.

Whether 2002 was indeed the fourth year of a drought cycle, or just a taste of a reality to come, the benefit of Hyrum Reservoir to the nearly 200 farms it feeds prompted the Hyrum City Council to express its support of reclamation projects.

"Cache Valley has endured another year of drought thanks to the foresight of those who planned and built the reservoirs holding our precious water supplies," Mayor Gordon M. Olson said in a written statement.

In the resolution and the letter, Olson and the city accuse those who call for the decommission of dams shortsighted. Olson wrote that they ignore the economic benefit of having water held back by dams and they don't worry about the 10 million acres of farmland to which reclamation projects supply water, not to mention the \$4.3 billion they add to the economy.

Navajo Dam re-operations on the San Juan River

Mr. Ken Beck
Bureau of Reclamation
Western Colorado Area Office
835 East Second Avenue, Suite 400
Durango, CO 81301
Via Fax: 970-385-6539

Re: Navajo Dam Operations, Draft Environmental Impact Statement

Dear Mr. Beck

Living Rivers appreciates this opportunity to submit the following comments on the Draft Environmental Impact Statement (DEIS), Navajo Dam Operations, September 2002 (DES-02-35).

The San Juan River is one of the most dynamic ecosystems on the planet, supporting an incredible diversity of endemic plants and animals, as well as native cultures. We are quite concerned with the demise of its native fish species, but believe with proper river management, full recovery of these species is achievable.

It has been acknowledged that the two prime reasons why San Juan River native fish are endangered can be attributed to alien fish competition and the building of dams and diversions. Despite this, the DEIS provides little assurances that these impacts will be adequately addressed, such that recovery can occur. In particular, Living Rivers finds the 250/5000 alternative recommended in the DEIS to be totally unacceptable as a means to achieve this objective.

First, while the DEIS acknowledges that endangered species have yet to achieve a "positive population response" from the present flow regime, it none-the-less recommends continuing with the same regime. In fact there has been little to no benefit whatsoever to the endangered fish populations as a result of present dam operations.

Since it's not working now, and the DEIS provides no evidence to ensure that it will work in future, it seems imprudent to make permanent such a flow regime. Furthermore, it seems imprudent for the DEIS to be making any recommendations at all, as the final report of the Biological Committee has yet to be issued.

Second, without recognition of the need to: increase the length of the habitat reach through effective fish passage and potential dam decommissioning; mandate mechanisms to ensure sufficient in-stream flows in light of existing and proposed diversions and climate change; and aggressively eliminate non-native fish and plant threats to the habitat, it is unlikely that full recovery of razorback sucker or Colorado pikeminnow will ever occur in the San Juan River. Failure to adequately address these critical issues, not only threatens the validity of preferred alternative, but all alternatives presented in the DEIS. The comments which follow address these deficiencies within the EIS in greater detail.

1. Truncated reach too short to enable recovery

Historic habitat for the native San Juan River fish included the spawning beds above Navajo Dam and the sections now inundated by Lake Powell reservoir. The critical habitat identified by the DEIS on the San Juan River is substantially less, the distance between Lake Powell reservoir and Navajo Dam. Furthermore, this remaining stretch is truncated even further by a number of diversion projects.

The only remaining critical habitat, of the native 320 river miles, available for fish recovery is the San Juan River which lies between Hogback Diversion Dam and the head of Lake Powell reservoir, approximately 138 miles. Included in this 138 miles, are the 57 miles of swift water at San Juan Canyon, which is documented as habitat not advantageous for the rearing of native fish. Therefore the total available habitat for fishes that once ranged throughout the San Juan River and its tributaries has been reduced 75 percent to a mere 81 miles.

The DEIS does not demonstrate how this remaining habitat is sufficient to accommodate the rearing of native fish. There are two kinds of habitat that are needed by the native fish of the San Juan River: spawning habitat and rearing habitat. It has been demonstrated that spawning habitat is available for the fish to utilize, but that rearing habitat for the hatchlings has been severely diminished, as most of the hatchlings drift into Lake Powell reservoir to be predated upon by the exotic fish. It has been suggested by aquatic biologists that historic habitat was available to the drifting hatchlings in the lower river reaches of the San Juan beyond Clay Hills and in the areas of the Colorado River mainstem.

While the preferred alternative does call for combined flows from Navajo Dam and the Animas River to drop to 500 cfs, this may not be sufficient to halt young fish from being carried down to Lake Powell reservoir, and anything lower would reduce the backwaters habitat, which is even more critical for their survival. The success being experienced with fish recovery on the Green River is largely the result of habitat length. The DEIS fails to address these restrictions on the San Juan River, or the alternatives available to correct them.

First, most of the water diversions do not allow for adult fish passage to enable spawning in the upper reaches of the remaining habitat. This includes the diversions of the Animas River, which is part of the historic habitat of the endangered San Juan River fish. And while a fish passage device has been constructed at the Hogback Diversion Dam, it has not been determined if endangered fish even utilize it.

Second, even should successful fish passage be achieved, there is no evidence that this stretch of river will be sufficient to accommodate the needs of these larval and early juvenile fish. Historically, San Juan River native fish could rely on the free-flowing Colorado through Glen Canyon to provide both rearing habitat for San Juan River native fish, and as a refuge in times when the San Juan River ran dry. Decommissioning Glen Canyon Dam would restore the historic geomorphic habitat that the fish evolved with and would also favorably increase the range and conditions of critical habitat necessary for the recovery of San Juan River native fish.

The DEIS should have: one, identify how successful fish passage will be achieved to maximize availability of the remaining habitat; two, evaluate the effects of Glen Canyon Dam on the San Juan River Basin Recovery and Implementation Program (SJRBRIP); and three, evaluate the decommissioning of Glen Canyon Dam as a legitimate alternative to restore San Juan River native fish populations.

2. Long-term operations of Navajo Dam

At least until such time as Glen Canyon Dam is decommissioned, San Juan River native fish are dependent on Navajo Dam to reduce the likelihood that the remaining habitat will run dry. The DEIS, however, makes no reference as to the impermanence of Navajo Dam, and how its decommissioning, either through dam failure, or sedimentation could effect fish recovery.

Catastrophic floods are known to occur in the drainage of the San Juan River. Navajo Dam's ability to control floods has been called into question due to unexpected piping of reservoir water through the dam's earthen structure (Bureau of Reclamation, Engineering and Research Center, Denver). Such piping has caused other earthen dams to fail, such as BuRec's Teton Dam in Idaho, which caused loss of property and loss of life. The DEIS needs to document the integrity of Navajo Dam, and how, in the event of a dam failure, it would avoid a complete loss the San Juan's remaining, and/or recovered, native fish.

For Navajo Dam to use its river outlet works for extended periods of time during the seasonally adjusted high flows, the EIS must also report on the safety concerns related to cavitation and other potential operating hazards that could occur while using these outlet works (SJRBRIP Coordination Committee Minutes of 10/15/98).

As the San Juan River erodes a geographic area that includes soft host rocks, it is no surprise that it is the major contributor of sediment for the Colorado River system. This high content of sediment poses serious concerns to Navajo Dam operations, and will eventually force the dam's decommissioning. The DEIS must outline the timeframe by

which Navajo Dam will likely need to be decommissioned, and how this decommissioning will effect recovered endangered fish habitat.

3. Water quality concerns & climate change

The DEIS fails to adequately address how it will guarantee necessary in-stream flows. While historically, the San Juan River has run dry, this did not significantly affect native fish populations as they were able to seek refuge in the Colorado River. Until such time as Glen Canyon Dam is decommissioned, such refuge is not available. Therefore, BuRec must ensure water will be available for the fish. This is particularly problematic given the extent of unresolved water claims. While the DEIS recognizes the existence of such claims, and admits in particular that Navajo Nation claims, "if exercised could place in conflict most of the water in the basin," it outlines no mechanism for how the necessary in-stream flows will be guaranteed. Recent history on the Klamath and Rio Grande Rivers reveals that the Bureau of Reclamation has demonstrated an unwillingness to make such flows a priority.

Additionally, the DEIS fails to assess the likely impact climate change will have on water availability. The upcoming year, in particular, may be an eye-opener for resource managers and citizens of the San Juan River system. It is projected that even if the coming year receives normal precipitation, there will not be sufficient water supply to meet the level of demand (Personal communication, New Mexico Game and Fish, 2002.) This is indicative of the over-developed nature of the San Juan River and this issue must be more thoroughly addressed by the DEIS to produce water in times of drought for the recovery of native fish.

Recent reports issued by the US Geological Survey (USGS) specifically indicate that resource managers will have problems meeting their future water delivery projections (R. Hereford, Flagstaff and R. H. Webb, Tucson, 2002). The data indicates:

- The 20th Century was a wetter century than normal by 20.
- The 400-year average virgin streamflow for the Colorado River at Lee's Ferry, Arizona totals 13.5 million acre-feet per year; 16.4 was the original projection.
- Colorado River virgin streamflow at Lee's Ferry, Arizona can increase or decrease by as much as 35 percent.
- High magnitude floods can stress spillway mechanisms and overflows will damage areas of development; dam failures are possible.

Climate change is becoming an increasingly important issue affecting surface water management, thus it's surprising, in light of the above, that the DEIS did not address it.

The preferred alternative will only work when climate behaves normally and would fail in a severe and sustained drought. The DEIS should have provided the total amount of acre-feet required to conserve native fish species for each alternative, and how this relates to the natural annual flow of the Colorado River. It should have also provided adjusted streamflow statistics on the consequences of climate change. Such analysis is

imperative to properly manage the San Juan River and the conservation goals as outlined by the DEIS.

Lastly, the DEIS did acknowledge water supply constraints in its analysis of the 500/5000 Alternative, stating that it would not be technically feasible to implement due to present diversions. The DEIS failed to state, however, how such an alternative would in fact be of much greater benefit to the native fish, only that it is not feasible. The DEIS did not discuss opportunities for purchasing, transferring or otherwise acquiring the necessary water rights to enable the implementation of this more beneficial alternative.

To be credible, the DEIS should have developed an alternative based on the water needs of the native fish, then determined how to ensure the water availability and flow regimes that will best provide ensure such water is provided on a permanent basis.

4. Insufficient high flows

The maximum flows outlined in the preferred alternative are not sufficient to meet the needs of the razorback sucker. This fish responds very well to spikes in the hydrograph, but the DEIS ruled out flows above 5,000 cfs from Navajo Dam due to the technical constraints associated with the dam's river outlet works. As stated in the Flow Recommendations for the San Juan River, prior to Navajo Dam, spring spike flows of 33,000 cfs occurred at Bluff Utah, 30 percent of the time. However, the preferred alternative will not allow for such spikes. The preferred alternative is based on a calculation of the average spike flow, yet provides no analysis to demonstrate that such a flow is indeed sufficient to invoke the types of benefits necessary for the razorback sucker. Therefore, similar to the need to make necessary engineering modifications to allow for fish passage, the DEIS should have addressed more completely the benefits to razorback sucker recovery associated with higher and more consistent spike flows from Navajo Dam.

5. Removal of alien fish

It is well documented that the introduction of alien fish species has contributed significantly to the decline of the native fish populations in the San Juan River. Members of the Desert Fishes Council have specifically documented their concerns about alien fish impacts on the available resources of food and habitat in our desert rivers (Battle Against Extinction, W. L. Minckley, 1991).

Every alternative presented supports the continued existence of an artificial trout fishery. These fish should be removed because they significantly compromise native fish recovery goals—feeding on the larval and early juvenile native fish. Sport fishermen have alternative venues to pursue their recreation, some nearby where trout are a natural feature of river ecosystems. The native fish do not have such alternatives and are forced to compete for survival in an impossible coexistence. Other alien fish species, such as stripers, catfish and carp, too must be eliminated as opposed to the proposed suppression strategies.

6. Removal of alien plant species

Invasive tree species such as tamarisk and Russian olive need to be more aggressively mitigated with programs other than the mimicry of the natural hydrograph called for in the DEIS. These trees have dramatically changed the geomorphology of river bed, which alters the optimal productivity of the spawning habitat for the endangered fish, as well as the habitat of the endangered birds and some species of special concern. These exotic plants should be eliminated and replaced by native vegetation such as cottonwood and willow.

7. Water quality

The DEIS does not sufficiently address how water quality will be improved such that there will no longer be impacts on native fish. The health of San Juan River native fish is presently being compromised by oxygen sags, lesions from toxic chemicals associated with the production of petroleum products and sewage treatment plants.

This situation is anticipated to worsen as new projects and diversions come on-line. Pollution and heavy metals from return flows will increase, suppressing further native fish productivity. Increased selenium in the soil systems of the drainage is of particular concern, as it is known to shunt the reproduction organs of the endangered fish. Moreover, in the summer of 2001, BuRec published The Low Flow Test: San Juan River, which concluded that the reoperation of Navajo Dam, as called for in the preferred alternative, would not meet New Mexico water quality standards over the long-term.

The DEIS claims that BuRec plans to address these matters through dilution by the recommended flows. However, such flows are already being implemented, and water quality standards continue to be violated. Clearly, this is not a viable solution in the near or long-term. While the DEIS also states that efforts will be made to increase enforcement of non-point source pollutants, it provides no details of how this will occur and how this will necessarily benefit water quality.

8. Water management

The constraints facing the recovery of San Juan River native fish are indicative of a much greater disaster in years to come. The over allocation of the river, unresolved water rights claims combined with lower water volumes due to climate change will lead to extensive conflicts and a dried-up river with regularity. There will be no recovered fish, or water for many of the users that presently have rights. Surprisingly, however, BuRec is doing nothing to resolve this.

In addition to the comments pertaining to water quantity in item 3 above, BuRec must comprehensively address how water from the San Juan River basin will be allocated in such a way that the needs of native fish will not be compromised. BuRec must identify what mandated water conservation and water utilization policies will be enforced on all users to sufficiently reduce their take from the river to eliminate the likelihood of shortages, both for native fish and water users. Such policies will not only resolve many existing and future problems, but save money by eliminating the need for some of the

basin's existing and proposed projects.

Conclusion

Living Rivers has no confidence in the conclusions of the DEIS or any of its alternatives to successfully recover the native fish of the San Juan River. The preferred alternative represents the continuation of present operations, which has yet to demonstrate any results. Additionally, before any alternative can be adequately considered, the DEIS must be significantly expanded to address the likelihood that the current habitat is too short in length to allow for recovery, and alternatives explored to remedy this. The DEIS must also address specific mechanisms to maintain in-stream flows in light of present and anticipated demands on the system, climate change, and the prospect of Navajo Dam failure and eventual decommissioning. The removal of non-native fish and plant species must become a higher priority, as should improvements in water quality.

Alternatives, which may be more beneficial to recovery, such as the 500/5000 Alternative must not be excluded merely because of water constraints. BuRec should identify what's best for the native fish, then determine how to attain it, such as mandated water conservation and acquisition of water rights for the fish. Lastly, BuRec must face the reality that the San Juan is going to regularly run out of water if new water conservation, allocation and management policies are not swiftly implemented.

Sincerely yours,

John Weisheit
Conservation Director

RRFW Riverwire - BECOME A RRFW MEMBER FOR FREE!

December 9, 2002

River Runners for Wilderness invites you to become a member—it's free!

The Grand Canyon! Do you want to keep it Grand? Do you believe it deserves to be a designated, motor-free wilderness with fair access for anyone that desires to experience its wonders? Don't have a lot of ready cash, but still care about the issues? RRFW would like to extend a free lifetime membership to you!

Join us by filling out the form on the "join" menu at our website www.rrfw.org, or send us your name, complete address, phone (and fax if you have one), and email address via email at membership@rrfw.org or by mail to River Runners for Wilderness, PO Box 466,

Moab, UT 84532-0466. We'll keep you informed about the latest breaking river wilderness issues with mailing alerts, updates and bulletins.

We've contributed countless hours and quite a few dollars to the wilderness and access causes. In the last 6 months, here's what we've done:

- Issued alerts about moves in Washington DC to strip wilderness protection for the Colorado River, the Jackass Waterline Project, Firewalk group, alleged changes to non-commercial regulations, the Outfitter Policy Act, river fatalities and illnesses, exploring business permits as an alternative to concessions contracts, the new Westwater Permit system, and other important issues.
- Formed the Grand Canyon Wilderness Alliance (GCWA) of 5.5 million members with 30 other environmental groups to craft CRMP comments, participate in the CRMP process and advance a motor free wilderness designation of the Colorado River and Grand Canyon.
- Traveled to DC to educate our elected officials on the CRMP. During 3 days and 17 meetings, we asked our elected officials to support the ongoing CRMP and block any attempted legislation to interrupt it.
- Represented the interests of wilderness paddlers at meetings with BLM planners working on the Gunnison Gorge Management Plan.
- Traveled to Marble Canyon Lodge to attend a summit of individuals and groups exploring common interests and goals for Grand and Glen Canyons, as well as wilderness and educational conferences in Albuquerque and Tucson.
- Sent you up-to-date Riverwires on changes affecting Grand Canyon, from river flows out of Glen Canyon Dam to congressional actions in Washington, DC.

It's free, too. If you're interested in email alerts, email us at riverwire@rrfw.org.

We're happy to have you as a member, and please consider donations to help us cover expenses. We're particularly in need of a few things: postage stamps, 2 fax machines, paper, an Adobe Acrobat® program, a scanner and prepaid long distance phone cards.

We've been careful in spending our money, but long distance phone calls, travel expenses, Internet access, postage and office equipment and supplies add up. Can you help us out? It's fully tax deductible. Thanks!

River News 12/10/02

RRFW Riverwire - CRMP UPDATE: NEXT MEETING IN JANUARY 2003

December 10, 2002

For the first time in 30 years, a concerted effort is underway to address the backlog of recreational issues surrounding the Colorado River in Grand Canyon National Park. Issues such as who gets to go, allocation of use, the spectrum of concessions services,

The Herald Journal wilderness, helicopter and motorboat use issues are on the table. The next step in this process may be a week's worth of meetings in Phoenix, Arizona, at the end of January 2003.

During the summer, park planners once again undertook to move forward the Colorado River Management Plan "with much trepidation", according to park Superintendent Joe Alston. A series of public meetings was held this summer and fall from coast to coast across the nation, generating over 8000 comments from the general public by the close of the scoping comment period November 1, 2002. In an ongoing attempt to include stakeholders in this open public process, the Park is considering three meetings to further allow stakeholder input into the CRMP. These meetings are scheduled to occur at Arizona State University in Tempe, Arizona. The meetings are tentatively planned for January 29, 30 and 31 and may possibly be connected via videoconference equipment to locations at Northern Arizona University in Flagstaff and the University of Arizona in Tucson.

RRFW has learned that there may be two focus group discussions, and two expert panel presentations. The focus groups will be on 1) The non-commercial access system and 2) The spectrum of river concessions services. The expert panels will cover 1) Carrying capacity, group size, and seasonality, and 2) Allocation of use. The findings of these focus groups and expert panels will be used by the Park's CRMP contractor in helping the Park draft several alternatives for the final plan. These alternatives, with one selected as the Park's "preferred" draft alternative are slated to be released during the summer of 2003.

RRFW feels that the final plan would be better served if the Park released a variety of preliminary alternatives for public comment prior to coming forward with a draft preferred alternative. This practice is an accepted management plan process, both within the National Park Service and other land management agencies. Denali National Park released a draft of preliminary alternatives for public review last year, with no preferred alternative selected. The draft with a preferred alternative should be released shortly for a second round of public review. The Bureau of Land Management is currently allowing two weeks of comments on preliminary draft alternatives for a wilderness management plan on the Gunnison Gorge (see www.gunnison-gorge-eis.com). A review of this type allows additional public participation in the crafting of viable alternatives during the planning and development stages. RRFW is encouraging park planners to allow the interested public a similar opportunity for comment on alternative plans prior to the park identifying a draft preferred alternative.

Count on us to keep you informed on CRMP developments and other Grand Canyon issues as they come up.

RRFW Riverwire – COMMENT ON GUNNISON GORGE PRELIMINARY ALTERNATIVES

Gunnison Gorge National Conservation Area (GGNCA) has released preliminary draft alternatives for public comment, due by Tuesday, November 17. This stretch of the Gunnison River flows through a double canyon (2 rims) below Black Canyon of the Gunnison National Park. The Bureau of Land Management-administered area includes a variety of scenery, land uses and recreational opportunities divided into zones for different administration. Of particular concern to river runners is 14 miles of the river as it flows through the small inner canyon Wilderness Area of about 17,000 acres called Zone 1. River runners must hike to the launch area down the 1 mile Chukar Trail and either backpack their gear in or arrange with the approved horse packing outfitter to have it brought down. Consequently, this run is more popular with non-commercial kayakers than rafters. The take out is outside the wilderness boundary on BLM land at Gunnison Forks.

Extensive public and focus group meetings were held during the spring and summer. The GGNCA has released preliminary draft alternatives for its management plan revision. This is an opportunity for the public to be involved before the draft alternatives, usually with a “preferred alternative” chosen by the agency, are released. Current comments will be considered for incorporation into the draft alternatives which are scheduled for release in February, 2003.

Four preliminary draft alternatives are presented. Concerning Zone 1, Alternative A is the “status quo”, or keeping most management aspects as they are now. Currently, there is no formal permitting system for noncommercial boating use and fishing use. Commercial boating outfitters are limited to 2 launches per day, divided among several permitted companies (not concessions). Boating group size is limited to 12 people, regardless of trip type. Currently, a noncommercial trip must pay a small trip fee, read the regulations and sign the self-issued form on behalf of the trip at the Chukar launch site. This applies to non-commercial recreational boaters and fishers.

Carrying capacity has been determined to be 75 people per day in the small canyon. This number is exceeded about 10 days during the stone fly hatch in May and/or June. The group size maximum of 12 has been determined by the size of the existing designated campsites (no camping in non-designated sites). Self guided fishing visitors, when boating, are lumped with recreational boaters, and with backpackers and hikers if they are not using a boat.

Alternative B would keep commercial group sizes at 12, including guides, and would keep commercial launches at 2. Noncommercial groups would be reduced to 8 participants. A non-commercial permit system would be implemented and would allow 4 trip launches per day with a maximum of 6 boats per trip. Non-commercial trip participants would be subject to education of the requirements for travel in the canyon. Fees were not addressed in this alternative. This alternative would establish “use

indicators” and monitor user satisfaction levels, resource degradation and use adaptive management techniques to change policies and procedures to accommodate necessary changes.

Alternative C would use the same adaptive management techniques. Commercial launches would increase to 2 overnight plus 1 day use trip. All group sizes increase to 16 people (including guides for commercial trips). Unlimited guide training trips would be allowed. Two noncommercial trips would be allowed in addition to unlimited day use. Fees were not mentioned.

Alternative D deviates from specific prescriptions for recreational use, and instead creates an opportunity for deeper study and a longer, more intensive process for administering that use. This would be achieved by analyzing current visitation, existing resources and the present outfitter system. Needed changes would be identified and considered to shift allocation of use between trip types and between outfitters. Methods of assessing and monitoring visitor satisfaction and resource protection over time would be developed. A “friend’s group” would be formed to assist in management, trail and facilities work, user education and to provide feedback to the BLM.

RRFW believes rules should be applied evenly wherever possible between commercial and non-commercial trips. Therefore, disparities in group sizes, boat limits, and user fees are not justified. The scale of the canyon and river within it are small, and GGNCA has made a good case for establishing the group size of 12 people; an increase for any trip type is not justified. It also is difficult to justify limiting non-commercial use via a permitting system while a substantial amount of commercial allocation goes unused, as happens now. Similarly, noncommercial boaters have not been shown to cause a disproportionate level of resource abuse, making the proposal to require educational programs an unnecessary burden to noncommercial boaters and BLM administrators. Furthermore, few permitting systems in use today are fair or satisfactory to do-it-yourself boaters.

Alternative D creates some exciting opportunities, but at the same time, provides no safeguards that the outcomes will be appropriate. Budgetary and legal concerns could make this a difficult process, and clearly, it will take longer. It appears to be a new concept in draft alternatives, and the GGNCA should be applauded for including it.

The current situation, Alternative A, works nicely for non-commercial boaters. Admittedly, there are resource issues stemming from the increased fishing use during the stone fly hatch season, but boating logistics limit access far more than agency obstacles. RRFW urges GGNCA to postpone formal permitting of non-commercial boaters as long as possible to avoid the substantially increased administrative overhead and dissatisfaction among non-commercial boaters.

The alternatives include much more than the boating issues covered here, we urge you to go to the GGNCA Management Plan website at www.gunnison-gorge-eis.com. To get a detailed Excel spreadsheet of each alternative’s boating-related elements, reply to this message and you will receive it as an attachment. Comments are due tomorrow, Tuesday, December 17, 2002. Send them to Angie Nelson at Tetra Tech, Inc. (acting as

a contracted agent to the BLM), by email: angie.nelson@tetrattech.com or by fax: (720) 406-9114.

LR Press Release 12/16/02

Congressman Touts Living Rivers "Record of Success" at Colorado River Water Users Meeting

(Las Vegas) According to Congressman John Shaddeg, R Phoenix, the greatest threat to the future of Colorado River management is not the forces of nature, or the Southwest's growing population, but the advocacy group Living Rivers.

Throughout the course of his 40 minute address to the annual Colorado River Water Users Association (CRWUA) at Caesar's Palace Hotel, he emphasized the growing power and influence Living Rivers is playing in Colorado River politics.

"These people have a track record of success that is enviable," Shaddeg told the capacity crowd of water agency brass, irrigation district representatives and government officials, who earlier heard remarks by Interior Secretary Gale Norton. "It would be a grave risk or a dangerous gamble to bank on them not winning, because they are more determined, more patient, working hard and growing."

Remarking on Living Rivers' calls for aggressive water conservation strategies, such as mandated cropping patterns that preclude water-wasting, non-food crops like alfalfa, Shaddeg hoped to mobilize opposition to Living Rivers amongst the CRUWA rank and file--the irrigators. Eighty percent of Colorado River water is used for irrigation, roughly half of this is for alfalfa and other forms of cattle feed.

"We are certainly pleased that Representative Shadegg continues to publicize the shifting debate surrounding the Colorado River," says Lisa Force, Living Rivers Program Director who is attending the CRUWA meetings. "It's unfortunate, however, that he tries to mobilize the water users to swim upstream against mounting public opinion. There are only a few hundred Colorado River Water User members; it's the 280 million people in the US who ultimately have a say over this federally-managed river."

Shaddeg was particularly concerned with Living Rivers' Colorado Riverkeeper program, which is affiliated with the international Waterkeeper Alliance based in New York and founded by Robert Kennedy, Jr. "I rue the day when Colorado River water use is decided by the East Coast," Shaddeg said.

Shaddeg, a long time defender of Glen Canyon Dam, reinforced the growing support for Living Rivers' efforts to bring about the dam's decommissioning. "We're hearing this proposal coming from more and more reasonable voices," he said.

Shaddeg alluded to this growing public influence earlier this year when he and three other western Congressman co-authored a fund raising letter for the Page, Arizona-based Friends of Lake Powell. "If there were a vote on the floor of the U.S. House of Representatives tomorrow that called for the decommissioning of Glen Canyon Dam and the draining of Lake Powell, there is a chance that we would lose that vote," the letter stated.

"It's not a matter of if, but when such a vote will be lost," adds Force. "The water loss through evaporation and seepage alone associated with Lake Powell reservoir could service four million people and generate \$500 million in revenues for the federal treasury. Properly organized, such urban demand can generate a lot more political clout than a handful of federally subsidized farmers."

River News 12/17/02

RRFW Riverwire – MORE ON GUNNISON GORGE PRELIMINARY ALTERNATIVES

Comments are due today, Tuesday, December 17, 2002, not November 17th as listed in some copies of yesterday's Gunnison Gorge Preliminary Draft Alternatives Riverwire.

Gunnison Gorge NCA has received the results of a user satisfaction survey conducted by Arizona State University over 2 years (2 seasons), according to Bill Bottomly, Planning and Environmental Coordinator at the Bureau of Land Management unit.

"We were happy to hear that recreational users are generally very satisfied with their visits here", he said. There was a notable exception, however. Guests of commercial outfitters were very unhappy with what they perceived as "excessive crowding" of the river canyon during their visits, rating their satisfaction at 2.9 out of a possible 10.

Ironically, GGNCA's boating outfitters are calling for an increase in their launches, currently set at 2 per day, and in their group sizes from the 12 allowed now to 16. They also would like to conduct guide training trips outside of their current allocation instead of using some of their launches for training purposes. This additional use would seem to run very counter to the wishes of their clients.

He also confirmed that Alternative D-1 is a relatively new concept in EIS drafts. "While our status quo, Alternative A, seems to be filling most users' needs, we know that with increased visitation we will have to find better ways to deal with use and safeguard the resource without sacrificing user satisfaction" he stated. "We hope to accomplish with Alternative D".

Alternative D-1 establishes a "Wilderness Recreation Strategy" by meeting 5 specific outcomes: 1) Analysis of visitor use and resources and consideration of the existing outfitter system and noncommercial use, 2) Identify needed changes to existing system to consider additional use by all visitors and possible reallocation of current use. 3) Process for expanding opportunities for new outfitting companies 4) Possible changes to all recreational management to protect wilderness values and 5) Methods of assessing and monitoring visitor satisfaction and resource protection over time.

The alternative would also form a citizens group to assist the BLM with managing the resources, providing feedback on management, educating users, monitoring and improving conditions and providing volunteer assistance with facilities and trails maintenance. Comments are due today. Direct them to: Angie Nelson, Tetra Tech, Inc. , at fax number 720.406.9114 or by email to: angie.nelson@tetrattech.com.

Environmental and wilderness laws have established conduits for public involvement and direction in how our lands are protected and used. RRFW urges you to participate in the process when and where you can.

Living Rivers Currents 12/23/02

San Juan River Fish Need Lake Powell Drained

While Glen Canyon Dam's impacts on the ecosystem at Grand Canyon are well-documented, less publicized are the impacts that Lake Powell reservoir has on critical habitat upstream. Nowhere is this more apparent than on the San Juan River where 20 percent of the habitat has been inundated by the reservoir. The Bureau of Reclamation (BuRec) claims it can remedy these problems by re-operating Navajo Dam upstream, but Living Rivers is leading the effort to reinforce how futile this exercise has been, and will continue to be, until Lake Powell reservoir is drained.

The San Juan River is well-known for contributing about a third of the sediment that historically nourished the lower Colorado River system and its delta. The 355 mile long San Juan River is also one of the most unique ecosystems on the planet, supporting an incredible diversity of endemic plants and animals, as well as native cultures. But, like so many rivers in the Colorado watershed and beyond, the San Juan has suffered tremendously as a result of dams and water diversions.

Of the six native fish species that once thrived in the San Juan, four are species of "special concern," and two are threatened with extirpation. Under pressure from the Fish and Wildlife Service, BuRec has been studying ways to modify the operations of its Navajo Dam facility to improve San Juan River habitat conditions for the endangered Colorado Pikeminnow and the Razorback Sucker. Located 208 miles upstream from where the San Juan River becomes part of Lake Powell reservoir, it is believed that changes in dam operations could bring about the recovery of these native fish.

But, as was acknowledged in a recent Environmental Impact Statement on the operations of Navajo Dam, such flow regimes have yet to achieve a "positive population response." In fact, scientists have concluded that there has been little to no benefit whatsoever to the endangered fish populations as a result of present dam operations. Nonetheless, BuRec recommends continuing with the same regime.

"The problem is they're looking in the wrong direction," says Living Rivers conservation director John Weisheit. "The major constraint is not the need to manipulate flows, but to recognize that the remaining stretch of river is too short to allow for young fish survival."

Historic habitat for the native San Juan River fish included the spawning beds above Navajo Dam and the rearing sections now inundated by Lake Powell reservoir. Navajo Dam, Glen Canyon Dam and the nine diversion dams in between, have reduced river habitat down to 81 miles (a loss of 75 percent). While it has been demonstrated that spawning habitat is available for the fish, the important rearing habitat for young fish is insufficient. Hatchlings drift into Lake Powell reservoir and are consumed by non-native fish before they have sufficiently matured to swim upstream against the current.

Historically, the native fish of the San Juan River could rely on the free-flowing Colorado through Glen Canyon to provide both rearing habitat and refuge habitat when the San Juan River ran dry. Decommissioning Glen Canyon Dam would restore the historic geomorphic habitat that the fish evolved with, as well as increase the range and conditions of critical habitat necessary for the recovery of these incredible fish.

"BuRec is completely ignoring these rearing habitat constraints and the role a decommissioned Glen Canyon Dam must play in eliminating them," adds Weisheit.

"BuRec must stop wasting public monies pretending. They must concede that this remaining habitat is not sufficient to support recovery, and that they will be in violation of the Endangered Species Act until Lake Powell is drained."

Living Rivers Currents 12/23/02

Delta May Suffer from Low-Flowing Rio Conchos

Living Rivers is monitoring a new threat to the people and ecology of the Colorado River delta. In retaliation for an overdue Mexican water debt, the U.S. International Boundary and Water Commission (IBWC) has begun researching the feasibility of stopping Colorado River water from reaching the already parched Baja California.

Under a 1944 treaty, the U.S. must deliver to Mexico an average of 1.5 million acre-feet of water annually from the Colorado River. This represents a scant ten percent of the river's historical natural flow which nourished the delta region before the Colorado was dammed. Although the river basins are geographically unrelated, the same treaty

requires Mexico to deliver to the U.S. an average of 350,000 acre-feet of water a year from the Rio Conchos Basin and other tributaries. Due to an extraordinary drought in the state of Chihuahua, Mexico has fallen behind on its deliveries for two consecutive five-year cycles.

The Colorado River water currently delivered to Mexico is used for irrigation in Baja California and for the densely populated city of Mexicali. What little water is left, to support the environment and the many threatened species of the delta, comes mostly from agricultural runoff, or excess "spills" from U.S. reservoirs during years with above-average runoff. This is an unlikely occurrence considering the current drought cycle.

Gordon Hill, general manager of Bayview Irrigation District in south Texas, said recently, "When I suggested blocking the Colorado more than three years ago nobody—the Clinton administration, the State Department, the IBWC—would look at it. Now, finally, we have come full circle."

The threat has received support from both Texas Agriculture, Secretary Susan Combs, and Texas Commission on Environmental Quality, Chairman Robert Huston. Secretary Combs has called on the Bush administration not only to withhold Colorado River water from Mexico but also to cut economic aid.

Living Rivers Currents 12/23/02

Colorado Riverkeeper Off and Floating

When the Waterkeeper Alliance approved Living Rivers' Colorado Riverkeeper program in October, we quickly discovered that many Colorado River boaters are very eager to advocate for watershed protection and to share that knowledge with the boating public.

By combining environmental advocacy with river running, three patrol trips involving 25 people have already plied 335 miles of the Colorado watershed to spread the protection message by engaging the people they meet on the river, and by monitoring the river reaches for environmental degradation.

The first launch occurred in Grand Canyon National Park and was led by Tom Martin of River Runners for Wilderness. The second Patrol was led by the Colorado Riverkeeper coordinator, John Weisheit, which launched on the Green River above Canyonlands National Park and included the Colorado River through Cataract Canyon. The third trip was led by Susette DeCoster, of Colorado Plateau River Guides, and launched directly below Hoover Dam. These three river trips were completed in areas managed by the National Park Service, where the natural ecology has been heavily impacted by the two largest concrete dams on the Colorado River—Glen Canyon and Hoover Dams.

The Grand Canyon trip began below Glen Canyon Dam, with unnaturally crystal clear and cold water flowing past sediment-starved beaches which, like the river's endangered fish, are barely hanging on to existence.

Where was the missing sediment? In Lake Powell, where the Cataract Canyon patrol ended. These boaters had to endure 30 miles of massive sediment deposits revealed by the lowering of Lake Powell reservoir during the driest period on record for the Colorado River. Their final night was spent on a vast plug of sediment (moist sand/clay topped by tumbleweeds) that rightly belonged in Grand Canyon, 200 miles downstream. Upon arriving at their final destination, Lake Powell's Hite Marina, they found the boat ramp closed due to sediment and the low reservoir level. The alternate ramp had a warning sign that exclaimed, "Use at your own risk."

DeCoster's patrol below Hoover Dam was marked by incredible amounts of pollution, including trash, toilet paper, human feces and odors of human urine, which impacted the camping areas and the natural hot springs for which this river corridor is famous. Additionally, Homeland Security helicopter overflights kept a close eye on all river visitors.

The Colorado Riverkeeper will continue to document the violations they encounter on their patrols and to engage in outreach activities whenever possible. Our next patrols will occur in the coming Spring on the Green and San Juan Rivers. Contact Living Rivers if you would like to take part.

Canyon Outfitters Saying No to River Wilderness

Representatives of Grand Canyon National Park's \$30 million commercial river outfitting industry are discussing a bill for Congress that would exclude the Canyon's river corridor from wilderness designation. If enacted, this would be a significant blow to efforts to restore the Colorado River in Grand Canyon National Park.

At issue is the use of outboard motors by the majority of Grand Canyon river outfitters. Motorized pontoon boats can accommodate 32 people and whisk them through the Canyon. The designation of wilderness would likely lead to a phase-out of motors, forcing the companies to revert back to smaller oar-powered rafts and traveling at river pace.

This is a major issue now being addressed by Grand Canyon National Park through a revision of its Colorado River Management Plan. Concerned that the outcome of this process might cause their motors to be destined for the scrap heap, the outfitters are considering help from Congress. The Grand Canyon River Outfitters Association is discussing a wilderness bill that only includes the terrestrial portion of Grand Canyon.

"This is a hollow bill which has nothing to do with protecting Grand Canyon and everything to do with preserving profits," says Jo Johnson of River Runners for Wilderness, a project of Living Rivers. Johnson's group and the Grand Canyon Wilderness Alliance, of which they are a part, is concerned that should such a wilderness bill pass, neither the Park Service nor Congress will be willing to challenge outfitters and pursue protection of the river corridor in the future.

"It's unimaginable that the soul of the Canyon would be excluded," says Roderick Nash, author of *Wilderness and the American Mind*. "This wild corridor of deep time, unique on this planet, deserves the most wilderness-conscious regulation our political system is capable of providing." Certainly the biggest loser would be the Canyon's unique native ecology. According to Kim Crumbo, former wilderness coordinator for Grand Canyon National Park and now with the Arizona Wilderness Coalition, "Designation of wilderness would give the National Park Service a much stronger legal mandate to restore the river corridor back to its pre-Glen Canyon Dam state."

Although Glen Canyon Dam has caused extensive impacts to the river, this in no way precludes the river corridor from wilderness designation, as the criteria for inclusion into the wilderness system is a much lower standard than the criteria for how wilderness is managed once designated. In 1978 Grand Canyon National Park recommended the river corridor as potential wilderness, but it has yet to seek designation, largely due to pressure from outfitters.

According to the Wilderness Act, wilderness designation would compel the Park Service to work toward managing the river corridor in an "unimpaired state," and, "seek to sustain the natural distribution, numbers, population composition, and interaction of indigenous species." Such a mandate would allow the National Park Service to challenge the Bureau of Reclamation to go much further in its efforts to mitigate the impacts of Glen Canyon Dam on Grand Canyon. With four of the Canyon's eight native fish gone, and three more just hanging on, such designation, "would be a welcome tool," adds Crumbo.

One conservation group, the Grand Canyon Trust, feels it's inappropriate to pursue wilderness in the river corridor at this time. "We must first work to get the outfitters on our side, then work for wilderness on the river," stated the Trust's president, Geoff Barnard, at a meeting of Grand Canyon activists in November. But according to Johnson and Crumbo, this will never happen. "The outfitters will only get stronger and more set in their motorized ways if we continue to let them off the hook," says Johnson.

Big Straw Colorado's Pipe Dream

A \$500,000 study is being considered by the state of Colorado to determine the feasibility of a project to pump water from the Colorado River, at the Utah border, to the suburbs of Denver. Although officially known as the Colorado Aqueduct Return Project (CARP), it's nickname has become "The Big Straw." Early this month, Living Rivers voiced its opposition to the 600,000 acre-feet diversion at a public meeting held in Grand Junction.

With the federal government now forcing California to start reducing its take from the Colorado River, the state of Colorado is aggressively seeking ways to develop its unused water allocation. Initial costs for the Big Straw have been estimated to be \$5 billion. This projection does not include the operation costs, such as the energy necessary to pump the water uphill, nor the costs to mitigate the environmental damage. Pat Mulhern, a civil engineer speaking at the meeting stated "I'm not yet convinced that this project is economically or environmentally feasible and suggest that the proposed study focus on these two fundamental questions." Electricity costs alone have been estimated to be \$165 million annually. Matt Sura, director of the Western Colorado Congress said, "Isn't this the fatal flaw of the project? Why is a study even required?"

Water quality was one of the biggest issues raised by the public. Al Pfister of the U.S. Fish and Wildlife Service mentioned that selenium in the Colorado River at the Utah border "exceeds the current state standard 85 percent of the time. Poor water quality could affect numerous fish and wildlife species in the rivers and streams where the water is delivered."

The boosters refuse to look at conservation policies that would increase water yields by reducing consumption. Representing agriculture, Harry Talbott recommended a way to increase water yields by removing "guzzling plants, such as Tamarisk." Nic Korte of the Grand Valley Audubon Society noted that, "drip irrigation for agriculture can reduce water use by 30 -70 percent and increase crop yields 20-90 percent."

RRFW Riverwire - EXPERT PANEL AND STAKEHOLDER WORKSHOP DATES SET

The dates, times and locations for the next step in the Colorado River Management Plan have been announced. This step will involve stakeholder workshops and expert panels. The stakeholder workshops will cover the noncommercial trip permit system, and the spectrum of services to be provided to the public. Certain designated attributes (e.g. flexibility, simplicity, fairness, etc.) of a permit system and types of services will be rated against each other to understand what different segments of stakeholders consider to be important considerations. The Park and its CRMP contractor, SWCA, will use this expanded information in addition to scoping comments already received to craft the new CRMP.

The original concept included 10 designated stakeholder groups. Each group was to be comprised of 4 stakeholder representatives. These representatives would then participate in each of the interactive workshops. Some of the 10 stakeholder groups identified for inclusion were: non-commercial boaters, river outfitters, commercial clients, outfitting guides, wilderness groups, scientists, Native American Tribes, and ecological groups.

River Runners for Wilderness (RRFW), the Grand Canyon Wilderness Alliance, business interests and other stakeholders have voiced concerns about a lack in depth of the representation of the non commercial segment at the stakeholder workshops. While commercial boating stakeholder groups include river concessioners, commercial passengers, and river guides for a total of 12 stakeholder seats, non commercial boaters who include permit holders, passengers, non-commercial river running advocate groups and non-commercial support services all vied for a total of 4 stakeholder seats. Mary Orton, the contractor arranging these meetings, has acknowledged the noncommercial community may be underrepresented and is exploring options to address this concern raised by RRFW.

The expert panels' topics will cover allocation of user days among user groups--sure to be a lively topic--as one, and physical, social and ecological carrying capacity, group size and seasonality of recreational use of the river for the other discussion. All expert panels and stakeholder workshops will be held at the Arizona State Capitol building in the Governor's Protocol Room, 1700 West Washington, in downtown Phoenix, and video-conferenced to a room--as yet unspecified--at Northern Arizona University in Flagstaff.

Expert Panel #1 will be held on Wednesday, January 29, 2003 from 2:00pm to 5:00pm and 6:00pm to 9:00pm. The two Stakeholder Workshops will be held Thursday, January 30, 2003 at times to be announced. The second Expert panel will held on Friday, January 31, 2003, and be from 8:00am to 11:00am and 1:00pm to 4:00pm. In addition,

the sessions will be videotaped and made available to interested persons not able to attend the Arizona meetings.

All events will be open to the public, and the Expert Panels will allow for questions by the audience. More information will be coming your way as it is made available.

RIVERWIRE is a free service to the boating community from River Runners for Wilderness. Membership is FREE! Send your e-mail address to riverwire@rrfw.org and we'll add you to the RRFW RIVERWIRE e-mail list.

Take Action 01/22/03

Join Living Rivers to Save Grand Canyon Fish, January 28-29

The Glen Canyon Dam Adaptive Management Program (AMP) will be holding its next meeting Tuesday, January, 28 and Wednesday, January 29 in downtown Phoenix. For the past year, Living Rivers has been encouraging the AMP to be more aggressive in its efforts to bring about the recovery of endangered native fish in Grand Canyon National Park. Unfortunately, the AMP continues to drag its heels, so the plight of native fish in the Canyon continues to worsen. Humpback Chub populations have declined 80 percent to just 2,000 adult fish. Razorback Suckers have now joined the Bonytail, Roundtail Cub and Colorado Pikeminnows on the extinction list. Take some time to lend your voice to call for more urgent action!

RRFW Riverwire – GRAND CANYON RELEASES AIRCRAFT NOISE STUDY

The National Park Service at Grand Canyon has released a report titled, Aircraft Noise Model Validation Study, dated January 2003. The report completes a study to determine which of four computer models best calculates tour aircraft audibility in the Grand Canyon. The results of the study are important because computer models are the only practical means to assess progress in meeting the requirements of Public Law 100-91 to substantially restore natural quiet at Grand Canyon National Park. Audibility is the measurement used to define substantial restoration of natural quiet. The report was prepared by Harris Miller Miller & Hanson Inc., a leading acoustics consulting firm, for the National Park Service.

In the report, which can be found on the park's website at www.nps.gov/grca, and its attached appendices, the reader will find a detailed step-by-step description of all methods, data, and results of the study. This is a highly technical scientific report prepared by experts primarily for experts. Readers are strongly encouraged to start with the Executive Summary and Study Summary at the beginning of the report.

As detailed in the report, the study methodology was developed by consultant firms with comments, advice, and review by staff from federal agencies and a team of recognized experts in acoustics, statistics and scientific methods. In the Acknowledgements section, however, the authors carefully point out that the final interpretations and words in the report are those of the authors, Harris Miller Miller & Hanson Inc., and not those of any of the other study participants.

For additional information regarding this report, please contact Dr. Kenneth Weber, Grand Canyon Science Center, at (928) 638-7753 or Maureen Oltrogge, Public Affairs Officer, at (928) 638-7779.

LR in the News 01/27/03

Canyon's Recovery Must Rest on Science

The Arizona Republic OpEd

The Republic's January 19 editorial "Fish fight: saving chub must be more than just killing trout" is a good introduction to the plight of our state's most valuable natural

wonder, the Grand Canyon. However, continuing to allow the Glen Canyon Dam Adaptive Management Program (AMP) to control the Grand Canyon's fate, as the Republic recommends, will only speed the current death spiral of the canyon's native ecosystems.

From its inception, the AMP has opposed implementing U.S. Fish and Wildlife Service recommendations to mimic the Colorado River's natural flow regime, thereby propping up the Grand Canyon ecosystem. Ninety-five percent of the vital sediment and nutrients that would be deposited by a free-flowing river system are now trapped behind Glen Canyon Dam. Without sediment deposition, species go extinct and beaches for mammals, native vegetation and human recreation erode away. Four native fish species have already disappeared, along with river otters, muskrats and every single native insect species that formed the base of the food chain. Yet the AMP has proposed no viable plan for moving the necessary amounts of this sediment into the Grand Canyon.

Instead, AMP has undertaken a handful of experiments to try to build beaches by moving around the meager sediment that deposits downstream of the dam. The result of AMP's efforts to date is a precipitous eighty percent decline in the humpback chub population--the principle endangered fish species AMP is supposed to be recovering.

Because of these declines the AMP is now considering stocking the Grand Canyon with hatchery fish. This is not recovery. This is a zoo. Recovery implies self-reproducing native populations, not manufactured fish which cannot reproduce and which must be constantly restocked as they die off in their unnatural and inhospitable habitat.

Had the AMP been dominated by science as was presumably intended, it might have been a worthy process, capable even of achieving its objective. The AMP boasts stellar scientists producing good ideas for restoring the Canyon. Scientists, however, have taken a backseat to AMP politics, restricting recommendations to those that are politically acceptable, else risk having AMP's funding cut.

Dominated as it has become by state water engineers, industrial irrigators, and hydroelectric merchants, the AMP has been unwilling to support the changes in Glen Canyon Dam operations necessary to reverse Grand Canyon's ecological decline. The AMP players that are truly concerned with environmental restoration are simply politically outmuscled by those who wish to retain the status quo of abusing the Colorado River system for water and energy profits.

While society has an array of technologies to meet water and energy needs, we have only one Grand Canyon. If this natural wonder is going to be protected, the AMP must be replaced with a purely scientifically-based advisory panel. Its first task must be to produce an Environmental Impact Statement considering a full range of alternatives for Glen Canyon Dam operations, including those which will be truly effective in recovering Grand Canyon's native habitats. Only through such unbiased research and recovery programs driven by scientists rather than politicians will Grand Canyon's ecosystem have any hope of salvation.

The AMP participants convene here in Phoenix this week. At the January 2002 AMP meeting, the environmental group Living Rivers exercised their right to become involved in this taxpayer-funded process by presenting a document requesting some specific definitive actions on behalf of the collapsing Grand Canyon ecosystems. A full year later AMP leaders have still not replied. Arizonans, this is our Canyon, our tax dollars and our opportunity to demand results. Attend the AMP meeting this year and insist on real protection for the Grand Canyon.

Lisa Force, Program Director, Living Rivers For more information on the AMP meeting: www.livingrivers2.org

River News 01/28/03

RRFW Riverwire – COMMENT ON PWC USE IN GLEN CANYON NRA

This is a second comment opportunity on proposed PWC use in Powell Reservoir. The Bush Administration has proposed a rule which allows personal watercraft (PWC) operation on nearly all of Glen Canyon NRA. The ruling was published on January 17th. The administration made this decision despite the fact that the NPS' recent environmental review of PWC use at Glen Canyon found that the thrillcraft damage park resources and wildlife.

Also, there is a disproportionate acreage of the NRA open to PWC use, which is simply unfair to the majority of visitors who come to the recreation area to enjoy more contemplative forms of recreation like swimming, hiking, fishing, canoeing, kayaking, and wildlife viewing. The ruling comes despite continued overwhelming comments against personal watercraft (Jetski®) use at the National Seashore and various Parks, including Glen Canyon National Recreation Area.

PWC recreation causes significant damage to air and water quality, visitor enjoyment, public health and safety, natural soundscapes, and wildlife. At Cape Hatteras, PWC operation was the number one source of visitor complaints before the machines were finally banned there. In some instances, PWC activity and its proven threat to personal safety pushes other forms of recreation such as swimming or bird watching off a waterbody.

This is discriminatory. If you feel a full ban on PWCs in Glen Canyon NRA is the only appropriate action, please send your comments to Kitty Roberts, Superintendent of Glen Canyon National Recreation Area, and tell her that you support protecting the irreplaceable resources and wildlife of Glen Canyon from personal watercraft.

Letters should be sent to glca_pwc@nps.gov or to the address below. Superintendent Kitty Roberts Glen Canyon NRA PWC Rule-Making Box 1507 Page, Arizona 86040 RE:

RIN 1024-AC90, Comments on Draft PWC Special Regulations Had a close call or negative experience with PWCs after an otherwise idyllic Cataract Canyon trip? Include that in your letter to Supt. Roberts, along with other personal observations.

RRFW Riverwire - LAKE POWELL DRAINED 50%

LAKE POWELL DRAINED 50%--FOUR YEARS TO GO! MARINAS LEFT HIGH AND DRY, CONCESSIONAIRES CONTEMPLATE PULLING OUT

Lake Powell reservoir is down 86 feet from normal, equating to a reservoir that is half full. The National Park Service, which manages marina facilities at Lake Powell, is busy trying to make adjustments with the hope that they can still accommodate visitors at some locations. Meanwhile, the recently approved \$70 million Antelope Point Marina project is in jeopardy of never being used.

Now in the fourth year of an anticipated sustained drought, Lake Powell reservoir will soon be empty. Forecasters have informed the Park Service that the reservoir levels will only be getting lower. The reservoir is dropping faster than it can be replenished. Even when the snow begins to melt this spring, the reservoir is not expected to rise any higher than where it is right now. By July, the reservoir will again start dropping.

The United States Geological Survey 2002 report on Southwest climate change predicted that the Colorado Plateau would be heading into a 30-year period of below average river flows. Previous estimates by forecasters, on the impacts of such a sustained drought, calculated that Lake Powell would be drained within eight years. It's right on schedule. In July 1999, Lake Powell was at 90 percent. As of February 1, 2003, it was at 50 percent.

If the present drought does not relent, Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam. According to a model that was published in October of 1995 in the Water Resources Bulletin, if a severe and sustained drought similar to the drought of the late 16th century appears, Lake Powell could stay drained for eight years.

"We're witnessing the end of Lake Powell right now," says Living Rivers' Conservation Director John Weisheit. "This was predicted, and nothing the National Park Service or the marina operators can do will change this."

o At present three of the concrete boat ramps have been closed: Antelope Point, Stateline and Hite Marina. For Stateline, the concrete ends where the wet sand and mud begins; it was officially closed on February 3. For Hite Marina, river sediment closed the concrete ramp and an alternative ramp on gravel began in the autumn of 2002. This alternative ramp too is now closed due to sediment fill from the Colorado

River. Antelope Point's ramp was the first ramp to close last year, just three years after construction in 1999.

o A \$3 million emergency appropriation was made in January to extend boat ramps at Bullfrog, Hall's Crossing and Wahweap marinas. It is unclear, however, how far these ramps will be extended, or if additional funding will be sought to extend them all the way to the bottom as levels continue to drop.

LR Press Release 02/04/03

Living Rivers Welcomes New Outreach Coordinator

High-Profile Environmental Group Hires Outreach Coordinator To Target Colorado River Delta Issues as Drought Situation Worsens

As declining reservoir levels and water scarcity concerns multiply across the state and into Mexico, Living Rivers is pleased to announce the arrival of Michelle Pulich Stewart to the Arizona office, based in Scottsdale.

Before joining Living Rivers, Ms. Pulich served in a variety of non-profit, academic and government roles pertaining to resource management and habitat restoration, including: Lady Bird Johnson Wildflower Center, Texas Parks and Wildlife Dept, Maricopa Community Colleges, Sierra Club, Center for Biological Diversity and Sierra Madre Alliance.

"I'm pleased to be bringing both my research and on-the-ground organizing experience to the mounting ecological crises and restoration needs of the Colorado River here in Arizona and across the border into Mexico," says Ms. Pulich. "Even should drought conditions persist, there is more than enough water to meet the state's human and ecological needs, but the public has not been exposed to the river management options available to achieve such a balance. I look forward to helping make that happen," adds Ms. Pulich.

Her formal education includes both a B.A. from Rice University and a Master's degree in Environmental Resource Management from Southwest Texas State University, although she has found, streambeds, canyons, prairies, and prescribed burns to be striking repositories of knowledge.

"We are certainly excited about adding Michelle to our team," says Lisa Force, Living Rivers' Program Director. "Her teaching experience and activism history will be valuable assets to our efforts to bring about sustainable Colorado River management here in Arizona as well as delta restoration."

Ms. Pulich also enjoys backpacking, yoga, gardening, and of course, floating down rivers. Ms. Pulich will be married to Alex Stewart in late May of this year.

Living Rivers works to mobilize people to protect and restore the integrity of rivers and watersheds.

The National Park Service, which manages marina facilities at Lake Powell, is busy trying to make adjustments with the hope that they can still accommodate visitors at some locations. Meanwhile, the recently approved \$70 million Antelope Point Marina project is in jeopardy of never being used.

Now in the fourth year of an anticipated sustained drought, Lake Powell reservoir will soon be empty. Forecasters have informed the Park Service that the reservoir levels will only be getting lower. The reservoir is dropping faster than it can be replenished. Even when the snow begins to melt this spring, the reservoir is not expected to rise any higher than where it is right now. By July, the reservoir will again start dropping.

The United States Geological Survey 2002 report on Southwest climate change predicted that the Colorado Plateau would be heading into a 30-year period of below average river flows. Previous estimates by forecasters, on the impacts of such a sustained drought, calculated that Lake Powell would be drained within eight years. It's right on schedule. In July 1999, Lake Powell was at 90 percent. As of February 1, 2003, it was at 50 percent.

If the present drought does not relent, Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam. According to a model that was published in October of 1995 in the Water Resources Bulletin, if a severe and sustained drought similar to the drought of the late 16th century appears, Lake Powell could stay drained for eight years.

"We're witnessing the end of Lake Powell right now," says Living Rivers' Conservation Director John Weisheit. "This was predicted, and nothing the National Park Service or the marina operators can do will change this."

- At present three of the concrete boat ramps have been closed: Antelope Point, Stateline and Hite Marina. For Stateline, the concrete ends where the wet sand and mud begins; it was officially closed on February 3. For Hite Marina, river sediment closed the concrete ramp and an alternative ramp on gravel began in

the autumn of 2002. This alternative ramp too is now closed due to sediment fill from the Colorado River. Antelope Point's ramp was the first ramp to close last year, just three years after construction in 1999.

- A \$3 million emergency appropriation was made in January to extend boat ramps at Bullfrog, Hall's Crossing and Wahweap marinas. It is unclear, however, how far these ramps will be extended, or if additional funding will be sought to extend them all the way to the bottom as levels continue to drop.
- Potable water is becoming a problem at Hite Marina. The site draws its drinking water directly from the reservoir, treats it and then stores it in tanks for consumption. But the intake buoy is about to go aground and needs to be extended into deeper water. Besides being expensive to modify the intake, there is no assurance that deep water can be maintained as Lake Powell's delta continues to advance beyond the bay at Hite.
- The planned marina at Antelope Point will find a 500-foot cliff being exposed where the second launch ramp is proposed. Calls to Antelope Point Holdings and their engineers, revealed no comment to the feasibility of the project. According to the National Park Service, construction was supposed to begin in March, but it has now been delayed to at least May.
- The problems at Hite Marina are causing the concessionaire, Aramark, to question whether they should shut their Hite operation down altogether. To preserve the marina may require moving it, a cost Aramark may not wish to incur. No decision has yet been taken. With visitation through Glen Canyon National Recreation Area dropping by 10 percent per year, Aramark may be looking to pull out of the other marinas as well.
- The fate of the white-water rafting industry, which concludes trips at the top of Lake Powell, is also a major question. With sediment and mud clogging the marina and boat ramp at Hite, rafters will have a very difficult time getting off the water.

"As the drought persists, it is going to be very difficult, if not impossible, to conduct business as normal with the river and reservoir users. This includes the Grand Canyon river runners who will lose the large Glen Canyon Dam releases they need to run their large motorized boats through the canyon only to arrive at the sediment-choked Lake Mead," adds Weisheit.

Lake Powell is not the only problem. The entire Colorado River storage system has dropped from 92 to 60 percent over the past 40 months. "Lack of access to flat water recreation is the least of our worries," concludes Weisheit. "The Southwest plumbing system is headed for complete catastrophe, and the Bureau of Reclamation and the seven states that use Colorado River water have no disaster preparedness."

RRFW Riverwire – NO WILDERNESS BILL WITHOUT THE RIVER

WILDERNESS COALITION DISCOURAGES LEGISLATION By Brad Fuqua Grand Canyon News Editor Sunday, February 02, 2003

As the next phase of the Colorado River Management Plan process gets ready to begin today in Phoenix, the Arizona Wilderness Coalition believes there could be something happening behind the scenes in Washington. Kim Crumbo, Grand Canyon regional coordinator for the Arizona Wilderness Coalition and former National Park Service river guide, said the federal agency's congressional liaison office in Washington has wilderness designation legislation on its docket, although "not signed off."

"The only way a wilderness bill would pass this Congress is to eliminate the river from wilderness consideration or grandfather in motorize use," Crumbo said Thursday. "All this should take place in the planning process ... why the Park Service is considering wilderness legislation at this time makes us suspicious. We're asking them to just pull it; let's wait until the appropriate time."

Grand Canyon National Park sources, including CRMP planning leader Rick Ernenwein, said they were not aware of any legislative activity in Washington. Therefore, they could not comment on AWC's information.

In a press release dated Jan. 22, the AWC claims the potential legislation "could blindsides the American people with a 1.1-million-acre wilderness proposal that removes the Colorado River from wilderness protection, thereby ensuring continued ecological damage from large crowds and pollution from motors." "We just want all that to stop until the public involvement process is completed," Crumbo said. "It's inappropriate to be pursuing this before the public process runs its course."

The AWC supports recommendations to not decrease use on the river, but spread it out over a longer time period while eliminating motors. At the same time, Crumbo said commercial allocations could remain the same while the cost of a river trip could become more affordable and available to more people.

River outfitters have a different set of recommendations on the issue to support their beliefs and Crumbo said they "have the best arguments." "We'll see what transpires,"

Crumbo said. "It should go on for another full year." In the meantime, the AWC planned to encourage people to attend this week's expert panels and workshops in Phoenix and Flagstaff.

RRFW Riverwire – LAWSUIT FILED TO START DESCHUTES COMMON POOL

A group of Deschutes River users filed suit Thursday, February 13th against Oregon's Department of Parks and Recreation (OPRD) and director Mike Carrier. The suit contends that the OPRD has violated Oregon law with its current role and stance in delaying implementation of a "common pool" permit system, that provides equal access to all, as called for in the Lower Deschutes River Management Plan (LDRMP). The motion was filed by the Northwest Rafters Association (NWRA), and Mark Shuholm representing the general public. This action is also being supported by National Organization for Rivers (NORS), River Runners for Wilderness, and the American Canoe Association (ACA).

The Plaintiff's position is that full implementation of the LDRMP will insure the greatest level of access to the Deschutes River by the general public for generations to come. A failure to immediately implement the LDRMP, as currently written and required by Oregon Law, jeopardizes future access by the general public to this public resource.

Under the guidelines of Oregon State Statue ORS 390.934, the LDRMP and its supplement were developed over several years with input from the OPRD, BLM, The Confederate Tribes of the Warm Springs Reservation, other government agencies – as well as the general public. The Lower Deschutes River Management Plan was finished in 1993 and the supplement in 1997. Both the LDRMP and the supplement were adopted by the OPRD under administrative rule OAR 736-040-0070. The LDRMP and its supplement call for implementation of a limited access "common pool" permit system once certain trigger levels of use have been reached for various segments of the river. A "common pool" system offers equal access to all parties – without preference given for any specific group or interest. If and once these trigger levels of use are reached for any year, then a "common pool" permit system is to be implemented the following year. Levels of use that would trigger implementation of the "common pool" permit system were reached in 1997, 1998, 1999, 2000, 2001, and 2002. Although the LDRMP has therefore called for implementation in each of the years 1998, 1999, 2000, 2001, 2002, and 2003, the OPRD has not taken the legally required action relating to implementation of the system.

Further, the OPRD is currently promoting an agenda counter to that outlined by the LDRMP. At a November 14th meeting of managers from the various agencies, the OPRD proposed a 3 year further delay in implementation of the "common pool" permit

system - as well as re-introducing the topic of a "split allocation" permit system - a system that would guarantee access to commercial interests by limiting access to the general public.

The Suit asks that the OPRD be found to have unlawfully refused to act and unreasonably delayed taking action in implementation of the LDRMP - and that the OPRD be compelled to implement the "common pool" permit system for the 2003 season.

**From panic to denial on water:
Reactions to crisis disparate in Four
Corners states' plans**

By Michael Booth

Denver Post Staff Writer
Sunday, February 16, 2003 - The multiyear drought in the Four Corners states has brought sacrifice to some cities and recreation areas, and a mere shrug of the shoulders from others.

From Salt Lake City to Aurora, and Albuquerque to Phoenix, water managers and their constituencies react to the absence of snow with the full range from panic to denial. Some scramble to prop up reservoir levels at all costs; others argue the definition of "reservoir" is a bank of water that gets drawn to zero in dry times.

Phoenix will exhaust its local reserves this summer.

Yet Rocky Mountain snowmelt coming down the Colorado River means the largest city in the Southwest has no lawn-watering curbs. Well-soaked residents even plant a winter variety of seed over their dormant summer bluegrass to ensure green color all year.

At half-full Lake Powell, the water playground for millions of Westerners, boaters this summer might want a taxi to get from the marina to the fast-receding Colorado River water. But the lucrative tourist season looms, and National Park Service officials contemplate blowing up a rock formation uncovered by the drought at the Arizona end so this summer's demanding boat traffic can avoid a 7-mile detour.

The Southwestern approach to drought is "definitely head-in-the-sand," said Owen Lammers of Utah-based environmental group Living Rivers, which is sharply critical of how federal dams and what it calls greedy cities rearrange Western water flows. "We're characterizing this as the Enron of water management. The government keeps saying lake levels will get better, and the reality is that things are going down, down, down."

The wide variance in public water restrictions can deflate conservation efforts by prompting complaints of unfair treatment and downstream waste, water experts said. And even if downstream draws from the Colorado River are legal, they may injure streams or lakes in a way that everybody has to pay for in the future.

"The river that many of these states depend on is being overtaxed, so despite what your rights are, there are reasons here to be concerned," said Bart Miller, water projects director for Land and Water Fund of the Rockies. "It strikes the average citizen as unfair or strange when others are using much, much more water."

Cities with looser water policies defend the lack of rules as a benefit of well-secured supplies.

"All these decades of planning for water resources and storage have paid off," said Ken Kroski, spokesman for the Phoenix water supply, where the main reservoir for the perpetual boom city is down to 14 percent of capacity. As Aurora tells people they can't plant a single flower this spring, and Denver ponders a year-round shut-off of lawn sprinkling, Phoenix is still in Stage 1 of its drought plan, asking for voluntary 5 percent cutbacks in home water use with no rules for what days to water.

Knowing there will be no water available from Arizona snowmelt or rain this summer, Phoenix is confident its share of Colorado River water coming down the cement channels of the Central Arizona Project will be more than enough for city lawns in 2003.

Checking in with other cities shows just how disjointed Western water policy can be - while Denver, Phoenix and Salt Lake City watch their reservoirs drain, Albuquerque will switch from more predictable well water to a new reservoir system over the next three years.

Santa Fe drivers can't drive through a car wash more than once a month. Tourists to the high-desert jewel won't get their hotel sheets changed until their fourth day.

Currently in Albuquerque, "when it's dry, we just pump more from the aquifer," Mayor Marty Chavez said. "But we're depleting the aquifer. We can get away with it for a summer or two, but not in the long term."

Realizing the underground supply may be used far faster than it is recharged by runoff, Albuquerque sought voluntary water savings last summer - of only 3 percent to 5 percent, a far cry from Denver's goal of cutting use from a normal year by 30 percent.

Around the Four Corners, these cities and recreation areas hope for snow with varying degrees of fervency:

Phoenix: Open taps in the desert

Phoenix has some of the lowest water rates in the West, and the only mandatory cut in effect right now is a 5 percent slice from government use.

"A lot of people automatically and incorrectly associate the desert with no water," Kroski said.

But the free-flow philosophy permeating Arizona does frustrate some water officials, including Phoenix's conservation coordinator, Tom Babcock.

"There really hasn't been a debate on more restrictions," he said. "It's ludicrous when you consider we're in the Sonoran Desert."

Phoenix did try a stair-stepped system for water rates, raising the fee per 1,000 gallons every time homeowners reached certain benchmarks. (Denver operates under that system, with drought surcharges added on top.) It didn't work for Phoenix, Babcock said, putting a disproportionate burden of the rates on lower-income residents with large families "and the crummiest plumbing."

The city is now back to a seasonal rate, charging more in summer for water than the winter base rate.

Even without water dribbling down from Arizona sources, Phoenix claims it has plenty of supply in the next few years because it draws a major allocation from Colorado River dams under federal interstate compacts. Siphoned off from Lake Havasu at the Central Arizona aqueduct project, most of the water for Phoenix this year will be Colorado snowmelt.

Salt Lake City: Bracing for the worst

Salt Lake City ends up with some water from the Colorado River basin, pumped across the Wasatch mountain range, but relies most heavily on snowfall in its famous ski areas to melt and flow down Deer Creek. Until late last year, Salt Lake had avoided the more severe droughts seen in neighboring states.

Now the city is preparing for the worst, water spokeswoman Stephanie Doerr said. Last year, it made up for shortfalls in its own basin through water purchases from the Central Utah Project, which brings Colorado River basin water under the Wasatch mountains. "That water just isn't available this year, because no one else has water, either," Doerr said.

Preparing for a hot summer, Salt Lake expanded the months for its higher summer water rates, recognizing what Denver saw last year in people watering heavily from May through October. The city also wants a stepped rate structure this summer, charging more for higher use, and will also start water meters "from the first gallon" rather than allowing a free minimum on each bill.

"We're nowhere near cracking this drought," Doerr said. "There is no winter. It's just not happening."

Lake Powell: Scrambling to stay afloat

Lake Powell has fallen to levels the massive Utah and Arizona reservoir hasn't seen since it was still filling up in May 1973. Last year, for the first time, Lake Powell did not

rise at all in the spring: Because the reservoir had to keep releasing water downstream to satisfy calls in California and Arizona, snowmelt running in added nothing to the pool. The same is likely to happen this spring, meaning the recreation pool starts low and will get lower.

Lake Powell is shutting some boat launch ramps and extending others with gravel, while considering what to do with entire marinas left too high and dry. At the southern end, the Castle Rock cut allowing boaters from the Wahweap marina to save 7 miles of travel now juts up above water, and the Park Service is debating whether earthmovers or explosives should be used to reopen the channel.

Environmentalists heckle the idea of going hard-rock mining to find more water, calling it typical of the way governments have deformed Western waterways in catering to jet skis and lawn sprinklers.

"In the name of emergencies, they'll do that kind of thing and ask questions later," said Lammers of Living Rivers. "Given the climatic conditions, we're going to be looking at a major crisis very soon."

Other cities need to think twice, though, before pointing fingers at Phoenix or Lake Powell management, said Barry Worth of the U.S. Bureau of Reclamation's Glen Canyon Dam office. If it weren't for water-banking systems such as Powell and Mead, upper Colorado River states such as Colorado and Utah would have to let far more river water go by their land this summer to satisfy compacts guaranteeing flows to California, Arizona and Mexico.

"Sometimes people will say, why does somebody in Colorado or Wyoming care about Lake Powell, because it's long gone from our state," Worth said. "It just happens to be where their insurance account resides."

Santa Fe: Cracking down on users

Santa Fe got serious about drought response before many Southwestern cities knew they had a problem, implementing its current severe stage of curbs on April 10.

Restrictions there include no new plantings of perennials and flowers, delaying hotel sheet changes, no washing of cars at home and only once a month at a commercial wash, one-day-a-week lawn watering and heavy surcharges. While Denver charges \$1.90 on each 1,000 gallons of water over 20,000, Santa Fe charges \$25.

Also in Santa Fe, water caught fleeing the scene of a crime - a leaky or misdirected lawn sprinkler - is officially dubbed "fugitive water" and can cost the homeowner a hefty ticket.

City reservoirs are 29 percent full, compared with 65 percent in the comparable season of an average year, spokesman Juan Rios said.

A major portion of Santa Fe water comes from wells mining the aquifers connected to the Rio Grande, but depleting those is a major concern, Rios said. Two more months of

drought will force the City Council to consider a complete watering ban or even a building moratorium, he said.

"We started out the winter very well. But it seems El Nino dried us up and left us hanging," Rios said.

Albuquerque: Switching philosophies

Albuquerque is overhauling both its physical and cultural approaches to water.

Over the next three years, the city will switch from well water to surface water, captured in reservoirs near the New Mexico-Colorado border and brought down the Chama-Rio Grande river systems. That means Albuquerque residents will be praying just as hard for Colorado snowfall as the residents of Denver do, Mayor Chavez said.

Environmental groups, however, question the new draws from the Rio Grande because they may further endanger the silvery minnow and other river life.

The cultural overhaul will take longer, Chavez added. "For years our building codes required X minimum amount of grass. We've changed that, but the cultural shift has been a little slow. It's hard to tell businesses to plant grass, then two years later say, take out your grass. Getting there takes time," Chavez said.

Las Vegas: Light on the restrictions

Las Vegas doesn't fall under the Four Corners moniker, but draws 88 percent of its water from the all-important Colorado River system through Lake Mead.

But one river doesn't make one uniform policy - under current drought restrictions, Las Vegas homeowners can water lawns every other day this coming summer, even though natural rainfall at 4 inches a year is less than one-third of Denver's.

The Las Vegas conservation program focuses on stopping water waste although a citizens advisory committee is considering small drought surcharges for this summer's water rates, said spokeswoman Tracy Bower.

Denver Post staff writer Michael Booth can be reached at mbooth@denverpost.com or 303-820-1686.

Hear the Echo...

50th Anniversary Yampa & Green River Trip, June 2-6, 2003

In June, 1953 Living Rivers' co-founder, the late David R. Brower, launched the modern-day river advocacy movement with a trip down the Yampa and Green Rivers in Dinosaur

National Monument. His objective, which was achieved, was to raise awareness to defeat the proposed Echo Park Dam and to save the Monument from inundation.

Join Living Rivers and the Colorado Riverkeeper, in association with Holiday River Expeditions and other leading Colorado watershed advocates, as we relive this historic trip and launch a new initiative to save Dinosaur from the much slower death caused by Flaming Gorge Dam upstream. The trip is limited to 25 people, so act quickly. The cost is \$1,000.

Participants in this river trip will include activists and naturalists who will openly share their river knowledge with you and your friends. We will discuss the river campaigns of the past and the present, and keep our river ecosystems healthy and our national parks protected. These respected members of the river community include:

Dr. Roderick Nash, who wrote the conservation classic *"Wilderness and the American Mind,"* will row his beautiful wood dory through the towering sandstone cliffs of the Yampa River. The most remarkable cliff face is called Tiger Wall, where tapestries of desert varnish color the surface like the fur of a Bengal tiger.

Jeff Ingram was hired by David Brower when he was the executive director of the Sierra Club, and specifically to help him with the campaign to keep dams out of the Grand Canyon. Mr. Ingram is currently writing a book about this successful campaign and will share this knowledge around the evening campfires after a satisfying dinner.

Dee and Sue Holladay founded Holiday River Expeditions in 1965 and have completed hundreds of river trips in Dinosaur NM. They will share their intimate knowledge of the human and natural history of Dinosaur National Monument as we hike to places of interest.

Kim Crumbo is a famous Colorado River boatman and professional river guide. He is also a passionate advocate of wilderness protection for the river corridors of the Colorado River basin. He is also a respected historian and naturalist, and the author of an excellent river guide that focuses on the human history of the Grand Canyon.

John Weisheit is the trip leader of this expedition and another long-time river guide of the Colorado, and a strong advocate for a free-flowing Green River. He has co-authored a book about the Colorado River in Canyonlands National Park, which will be issued

soon by the University of California at Berkeley. The Waterkeeper Alliance recently designated John as the Colorado Riverkeeper for his dedication to protect this endangered watershed.

For more information contact [John Weisheit](#) at (435)259-1063.

The History of the Echo Park Dam Controversy and the Birth of the River Protection Movement

The Bureau of Reclamation (the Bureau) became a very bold bureaucracy after the completion of Hoover Dam on the lower Colorado River. With the construction of that high dam, the Bureau was transformed into a government-owned business that provided electricity for the consumer market, which was a deviance from its original mission to provide irrigation water for farmers. This set a precedent for the United States government, because it could now compete with private industries and with its infrastructure subsidized by the US taxpayer.

In later years that boldness took another step, just like an expanding corporation, in the form of a search for new dam sites and with the assistance of western, pork barrel politicians. The Bureau tested the waters, so to speak, by proposing that a dam be

built in Glacier National Park, which, as all national parks are, protected by the Organic Act of 1916. That cornerstone Act mandates that park values be forever left "unimpaired by man." That plan rightfully met stiff opposition and the Bureau immediately acquiesced, but did not relent. They decided to try their luck with Dinosaur National Monument, which is protected under the Antiquities Act of 1906.

A certain professor at Harvard University, who had received the Pulitzer Prize for a history novel, steamed under his collar when he heard about the Bureau's continued aggression on our national treasures. His name was Bernard DeVoto, born and bred in Ogden, Utah, and he wrote a scathing article in 1950 for the *Saturday Evening Post* and sparked a movement to save river ecosystems that continues to this day.

In 1952 the Sierra Club hired its first executive director, David Brower, from Berkeley, California. Brower went to work immediately to further build the grassroots campaign that DeVoto started. He formed a coalition of conservation groups that included the Wilderness Society and the Issac Walton League. He involved another professor and Pulitzer Prize winning author from Stanford University, Wallace Stegner, to edit a book called *This is Dinosaur*, that would eventually end up in the hands of every member in Congress. Brower also organized week-long river trips to show Sierra Club members and supporters what was to be destroyed should the Bureau's dam be built. The campaign was successful by using all these organizing components and, by 1956, a vexed Congress killed the authorization to build Echo Park Dam.

Undaunted, the Bureau continued in their relentless campaign to build dams and power plants at the sacrifice of river ecosystems and taxpayers. In 1959 Floyd Dominy, from Wyoming, was appointed as the Bureau's commissioner and would match the organizing skills of David Brower, but in a contrary, top-down fashion. Audaciously, he envisioned building dams in the Grand Canyon, the most sublime canyon on the planet. Since dams could not be built in lands protected by the National Park Service, Floyd would build them above and below these protected lands. At that time Grand Canyon was a smaller national park, centered at Grand Canyon Village near the south rim.

Brower didn't waste any time and countered Dominy at every turn to successfully stop these two dams from being built and by using the same grassroots organizing skills as before. But a new twist was added to the campaign, which included a full-page ad in the *New York Times* and the *San Francisco Chronicle*. The ad's headline said, "Should we also flood the Sistine Chapel so tourists can get closer to the ceiling?" In 1975, Grand Canyon Park was enlarged and brought under the protection of the Organic Act.

Unfortunately, Brower was not successful in stopping the construction of Glen Canyon Dam. Before he died, in November of 2000, he launched yet another grassroots campaign to decommission this dam before its scheduled 100-year life span is completed; when sediment reaches the intakes of the emergency bypass tubes. On March 14, 2000, on the third "International Day of Action Against Dams, and for Rivers, Water and Life" held at Glen Canyon Dam, Brower, participants and 60 other environmental groups signed the "Glen Canyon Declaration." This document promises to restore the Colorado River in Glen and Grand Canyons to their full natural heritage by means of a grassroots campaign, that includes doing river trips.

Please consider your attendance on our Yampa River expedition, June 2 – 6, 2003, to commemorate a fantastic and exciting future for river restoration.

John Weisheit
Colorado Riverkeeper

Take Action 02/26/03

Living Rivers Director Runs for Sierra Club Board

Living Rivers and the Sierra Club have long shared some common goals, primary among them the restoration of Glen Canyon and the preservation of the currently threatened Grand Canyon ecosystems. So when the Sierra Club's nominating committee asked our own Lisa Force to run for a seat on the Club's national board of directors, it seemed a natural fit.

Ms. Force accepted the honor and is on the ballot for the 2003 Sierra Club Board of Directors. She is running with four other candidates on a slate which promotes an aggressive conservation agenda. The five candidates on Ms. Force's slate will be running against eleven other candidates for the five open board seats.

The other candidates on the slate are: Connie Hanson Gordon LaBedz Nancy Rauch Don Young

Please watch for your ballot statement from the Sierra Club, via mail or email, in the first week of March, and vote to save the planet!

Ms. Force's ballot statement is below. To access the statements of the other four candidates, please see www.johnmuirlives.org.

Sierra Club Ballot Statement:

LISA B. FORCE

Residence: Scottsdale, Arizona

Occupation: Program Director, Living Rivers

Contact: 480-990-7839; LForce@LivingRivers.org

Current Member since: 1998

Background:

Originally from Colorado, I've lived in Arizona for 15 years where I've worked for two leading environmental organizations, fighting for protection of endangered species and restoration of the Grand Canyon, Glen Canyon and the Southwest's wild rivers.

- Previously, owned a successful management consulting business for 8 years
- Longtime Sierra Club activist on sprawl, wilderness, energy and water issues
- Led grassroots activists in anti-logging campaigns
- Defeated state anti-wildlife referendums
- Successfully negotiated with government agencies for river and wildlands restoration
- Launched a Western Grazing Reform program

- Featured in National Geographic and BBC documentaries highlighting US/Mexico environmental issues
- Education: MBA; Bachelor of Science.

Endorsements include current Board members Marcia Hanscom, and Ed Dobson – who says: "Lisa Force is the fastest rising star in the Sierra Club's firmament. She has the skills, passion, and tact to excel at the most demanding of Club positions. We are blessed that she is ready and willing to serve."

Statement: My success in grassroots activism, plus strong business experience, will be assets to the Board. I need and appreciate your vote! Key committees in the new Congress are now chaired by stalwart allies of polluting industries, taking deadly aim at our forests, the Arctic, Yellowstone and more of our last wild places. We must unite now to stop Bush's attack on the environment. We must recruit more Sierra Club members, strengthen our legal tactics and promote aggressive on-the-ground activism. I'll champion Club efforts to defend hard-earned achievements, while creating and taking advantage of new advocacy opportunities at Chapter and National levels.

I'll help the Club achieve a groundswell of action to awaken and motivate the American people to:

- Aggressively protect our parks and wilderness areas;
- Uphold and strengthen environmental legislation;
- Protect public lands from development;
- Promote sustainable agriculture; and
- Create livable, sprawl-free communities.

I'll use my environmental advocacy skills, extensive fundraising background and experience as a successful businesswoman to promote a national agenda that will make the Sierra Club an even more powerful force by:

- Making sure Chapters and Groups get the resources they need. We must use every dollar more efficiently.
- Mobilizing all environmentally concerned citizens to support Club efforts, through expanded grassroots activism and media campaigns.
- Maintaining our strong Outings Program.
- Listening and responding to our members.

I want to hear from you how I can help make the Club work for you. Please contact me!

The Lake Effect

by Christopher Smart
The Salt Lake Tribune

BULLFROG -- Tourism promoters as well as environmentalists who despise Utah's largest reservoir agree on one thing: This is the year to visit Lake Powell.

Thanks to record-low lake levels, new beaches and eye-popping sandstone formations hidden underwater for years have surfaced.

The Lake Powell recreational experience, tourism promoters boast, is as breathtaking as ever. And this year promises to be the best bass-fishing year since 1996 along the reservoir's 2,000 miles of shoreline, say state fisheries biologists.

Meanwhile, environmentalists who favor decommissioning Glen Canyon Dam and draining the Colorado River water it impounds say chances to visit Powell are dwindling. If the drought continues for four more years, they contend, there will not be a Lake Powell. So those wishing to visit the lake should not wait any longer.

Boat ramps at Bullfrog in Utah and at Wahweap in Arizona have been lengthened to reach the receding waters. Now at a record low of 3,612 feet above sea level (equivalent to the low mark set 10 years ago), Lake Powell still provides excellent boating and fishing and superlatives still cannot describe its natural wonders.

However, the lake does not snake up its many narrow canyons as far as it did last summer, according to Morris Christensen, Bullfrog boat-rental manager. In the past, boaters navigating Forgotten Canyon could dock just below the Anasazi ruin known as Defiance House. This year visitors must hike a half-mile up the canyon to reach the ruin.

"It's so weird to come to a place where you were swimming last summer and now there's no water," Christensen says.

In the creek bed below Defiance House, green grass stands in bright contrast to the red rock walls and the 86-foot-high whitish bathtub ring that defines the drought and the diminished waters.

At Hite, where the Colorado River enters the reservoir, acres of mucky silt have sprouted weeds. The boat ramp has been moved several times, but the National Park Service and Lake Powell marina operator ARAMARK are just about out of moves until the water rises. In addition, pumps that supply the Hite community with culinary water from the lake must be moved before the silt clogs them. Boat ramps at Stateline and Antelope Point are closed.

But Dan Resmondo, the director of operations for ARAMARK's North Lake Powell marinas, says it is business as usual. "It's normal operation for us to follow the lake up and down," he says. "We're seeing the same levels we saw in February 1993."

"From a recreation standpoint, it gives a different perspective," Resmondo says. "The canyons look different. If you haven't been here for a while, it will look quite different and provide a new experience." Certainly Bullfrog does not look like it did four years ago, when the lake was at a record high of 3,698 feet. What once was a narrow waterway between Bullfrog and Halls Creek now appears as a hill. Four years ago, the dock was

not far from the marina store. Now, it's a quarter-mile away and looks to be sitting in an empty redrock basin surrounded by dusty buoys.

The Lake Is Open: The National Park Service will spend about \$2 million refurbishing and lengthening boat ramps at Bullfrog, Wahweap and Halls Crossing, says spokeswoman Char Obergh.

"We want people to know the lake is open," she says. "There may be some delays in launching, but we're doing everything we can to make it a good experience."

Lake Powell consistently ranks as the second- or third-most-popular Utah tourist attraction. Last year visitation dipped to 2.1 million from 2.3 million in 2001, says Jon Kemp, Utah Travel Council research analyst. He blamed the downturn on the aftermath of 9-11, as well as a perception that the lower water level hinders boating and the scenic experience.

However, the 200,000-visitor drop did little damage to the state's \$4 billion tourist economy, Kemp explained. "It's almost impossible to quantify any economic impact" from the 9 percent drop in Powell visitors.

All that could change, argues John Weisheit of Living Rivers, an environmental organization that favors draining Lake Powell. If the severe drought persists for four more years, he notes, the reservoir will effectively be drained -- dam or no dam.

"It's going to continue to drop. And it's going to drop dramatically. The boat ramps are going to run out of topography," he says.

That may sound like a wild claim, but it is not out of the question, concedes Andrew Gilmore, hydraulic engineer for the U.S. Bureau of Reclamation. "It's conceivable that we could run out of water at Lake Powell. If we had another four years [of drought], we'd be awfully close," he says.

According to bureau calculations, the lake level will fall until the spring snow runoff, when the water will begin to rise, Gilmore says. "Our current inflow forecast has Lake Powell dropping another seven feet until April, when it will begin to fill up."

But unlike 10 years ago -- when the lake level jumped by 60 feet during a spring with substantial snowpack across the Colorado River drainage system -- this year's melt will be modest. "The snowpack is fairly meager across the whole basin," Gilmore says. "Our forecast is for 58 percent [of normal] runoff."

Periods of low precipitation are the reason Glen Canyon Dam was built, Gilmore says. "We look at it like it's performing its job. In a drought, Lake Powell is doing its job," he says of its water-storage capabilities.

At 53 percent full, Lake Powell now holds about 13 million acre-feet of water, Gilmore says. The forecast calls for the reservoir to gain about 4 million acre-feet in runoff. But under the Colorado River Compact signed by the seven states in the Colorado River drainage, Lake Powell must deliver annually 8.23 million acre-feet of water downstream, where it is impounded at Lake Mead.

"In these drought years, more goes out than comes in," Gilmore says.

No one is sure whether the drought will continue. But a study in the Feb. 11 edition of Geophysical Research Letters tracking ocean temperatures and tree rings anticipates the drought will linger, according to one of its authors, Julio Betancourt.

A research scientist for the U.S. Geological Survey and an adjunct professor at the University of Arizona, Betancourt explains that the last time the South Pacific was as cold as it is now and the North Atlantic was as warm, the Colorado River drainage experienced the drought of the 1950s, which lasted 25 to 30 years in some places. "We are now in a megadrought," Betancourt says, "in that it stretches from Montana to New Mexico and involves several seasons."

Good for the Fish: Analysis of tree rings during a 750-year period in the region revealed that dry and wet patterns do not occur at regular intervals. "You can't predict drought by time. The tree rings show that droughts don't occur cyclically," he says.

Whether Lake Powell eventually turns into a mud puddle remains the stuff of conjecture. But in the short term, the drought is good for the warm-water fishery, according to Wayne Gustaveson, a biologist with the state Division of Wildlife Resources.

"We need these low periods to re-establish habitat and nutrients,"

LR Press Release 03/03/03

Living Rivers to Target Mill Creek Revival on March 14

We've seen it every summer: a dried-up creek along our beautiful Mill Creek Parkway, the most blatant example of the growing ecological crisis occurring along this much appreciated drainage. Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted. As drought and water demands persist, it's unlikely this situation is going to change without community support to bring our beloved Mill Creek back to life. Living Rivers will be kicking-off a new campaign to aid in the Creek's defense on Friday, March 14, the Sixth Annual International Day of Action Against Dams, and for Rivers, Water and Life.

The festivities begin with a noon rally and picnic on the lawn at the County Courthouse. Longtime environmental musician Peter Neils will help set a festive mood while a host of concerned citizens present information on how and why we need Mill Creek's flow. A set of recommendations for the County Council consideration will also be presented, along with ways in which the community can become involved in promoting them.

That evening, beginning about 9:00 P.M., Living Rivers will be hosting the "Mill Creek Revival & Colorado River Fiesta" at the MARC (100 North and 100 East). This free party will emphasize a revival spirit with dancing, costumes and games. There is no

admission charge and refreshments are free. Also at the MARC that evening, beginning at 7:00 P.M., is a free film "U.S. Foreign Policy: The War Against the Third World" sponsored by Moab Citizen's for Peace and Global Justice.

Mill Creek's ecology is being devastated. Native fish, such as the flannelmouth and bluehead suckers, depend on a flowing Mill Creek. Other critters, like beavers and muskrats, need Mill Creek too. The most critical habitat of Mill Creek is near the mouth, which provides a refuge and food source for the endangered and threatened fish species of the Colorado River.

"What's happening here in Grand County is emblematic of the larger problem affecting the entire Colorado River watershed," says John Weisheit, Living Rivers conservation director. "Despite nature's warnings that we are using far too much water, we continue to focus on getting more and not on conservation."

Last month the Grand County Water Conservancy District asked the Bureau of Land Management for permission to reduce by half the amount of water it leaves in Mill Creek below the diversion for Ken's Lake. This request will likely be denied. But the search for water continues as an expensive proposal to pump Colorado River water into Ken's Lake moves forward.

Evaporation and seepage losses to Ken's Lake alone amount to 30 to 70 percent of the water diverted from Mill Creek. Increasing this storage efficiency could go a long way towards helping to get water back into the creek.

Additionally, many of those irrigating with Mill Creek water are given no incentive to conserve. Their water rights are often based on what is known as a "use it or lose it" principle. If irrigators do not use the amount of water the state of Utah believes is necessary for them to grow their particular crops, they can lose their right to this water. Some farmers have stated that they would be glad to leave some water in the creek, if a system could be put in place to allow this to occur. For example, The Nature Conservancy has received approval to transfer water rights to the Utah Division of Wildlife Resources for increasing stream flow.

Most of the water diverted from Mill Creek is used for alfalfa, which, if not irrigated efficiently, can be a very water intensive crop. However, no help is available for those who are potentially interested in making the transition to more water efficient, higher value crops. For example, alfalfa can require four times as much water as grapes, and provides the farmer with a crop that yields only \$100 per acre-foot of water, whereas good quality grapes can yield \$7,500 per acre-foot. Implemented properly, such programs could not only aid in improving Mill Creek, but also increase the economic output of the community. It has also been documented that home values increase when they are associated with a functioning and attractive riparian ecosystem.

LR Letter 03/07/03
YDP Comments to the Bureau

March 6, 2003

Mr. Robert Johnson Regional Director Lower Colorado River Region U.S. Bureau of Reclamation PO Box 61470 Boulder City, Nevada 89006-1470

By fax: (702) 293-8614

Dear Mr. Johnson:

Thank you for presenting the Bureau's most recent draft of Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act (CRBSCA) (Public Law 93-320) on February 25, 2003. We write in response to that presentation and to reiterate our opposition to the Bureau's plan to request appropriations to upgrade and prepare the Yuma Desalting Plant (Desalter) for operations. We further emphasize our concern with the Bureau's failure to respond to Congress' request in the draft report presented this week.

The current version of the report to Congress includes a number of fallacies, inconsistencies and highly unlikely assumptions that overstate the economic feasibility of operating the Desalter and understate the feasibility of alternative measures for replacing the bypass flow. We again remind the Bureau that this report subjects the Secretary of Interior to a reprimand from Congress, which has legislated that:

The Secretary is authorized to provide for modifications of the projects ... to the extent he determines appropriate for purposes of meeting the international settlement objective of this subchapter at the lowest overall cost to the United States. 43 U.S.C. § 1574 (emphasis added).

Further, the Bureau has failed to produce the information requested by Congress concerning alternatives to operating the Desalter. Congress specifically requested a "report on alternatives to meeting Treaty requirements without the YDP, and actions the Bureau of Reclamation can take to reduce the high annual operation and maintenance costs." S. Rep No. 58, 106th Cong. 1st Sess. 80 (1999) (emphasis added).

We appreciate your correction of the estimated low-end cost of acquiring short-term leases of water, referred to in this draft as forbearance agreements, as well as the inclusion of the cost comparison table. However, to reiterate the other questions raised in our November 22 letter would be to virtually rewrite the entire letter. Therefore we refer you to our previous letter and again request answers to the questions and concerns therein.

In addition to the concerns already expressed, we request corrections to the current report and answers to additional questions as outlined in this letter.

Environmental Review

A complete environmental review of the impacts of re-operation of the Desalter or other alternatives must be completed prior to any implementation of actions to further the recommendations included in the report, including seeking congressional appropriations. We are concerned that the Bureau has already begun to channel funds towards preparation for reoperation without the benefit of environmental review, and without the benefit of analysis of fully developed alternatives.

The Bureau has also not yet secured a discharge permit for product water from the Arizona Department of Environmental Quality. Proceeding with appropriations requests and funding of Desalter readying activities without the appropriate environmental reviews would be pre-decisional.

Furthermore, we wish to point out that the language included in the current report and the cover letter from the Secretary which talks about assuring the operation of the YDP is pre-decisional in that it precludes a No Action alternative. Such language must be eliminated from the report and cover letter before transmittal to Congress.

Discussion of the Cienega de Santa Clara is incomplete, serves only to mask the importance of the wetlands to wildlife and humans, and retreats from the enhanced description in the previous draft. The Cienega de Santa Clara (not once referred to in full) provides habitat not only for migratory waterfowl and shorebirds, but also for threatened and endangered species. What is more, these species -- including the desert pupfish, Yuma clapper rail, and black rail -- have been listed pursuant to the U.S.'s and Mexico's endangered species statutes. Deletion of endangered species sustained by the Cienega does not eliminate the Bureau's obligations to endangered species, and what is more, the Bureau has glossed over a significant piece of information that we are sure Congress would appreciate having when weighing the costs and benefits of operating the Desalter.

Likewise, the reduced volume of water coupled with increased salinity of water reaching the salinity will degrade the ecosystem. This ecosystem is part of a Biosphere Reserve as designated by Mexico, is a major link in the Pacific Flyway and supports the vast majority of the Yuma clapper rail population. To claim that these effects "may" happen (p. 4) is deceptive and underestimates the impact to the environment that will most certainly occur as a result of operating the Desalter. Again, costs in the form of adverse impacts to the environment have been missed.

We also suggest you refrain from qualifying the Cienega as an "isolated" wetland. It is not, and this is a blatant attempt to minimize the size and importance of this wetland complex.

Economic Analysis

There are several fallacies and assumptions included in the economic analysis of operating the Desalter and implementing the alternatives. Many of the assumptions do not withstand the test of simple mathematical principles. Others are so optimistic as to be deceptive. In modeling projections, assumptions are necessary and in providing a

cost estimate range, optimistic assumptions can be utilized in predicting the low-end cost. If such assumptions are employed, however, equally pessimistic assumptions must be used in predicting the upper-end of cost ranges. This is not at all the case in the Bureau's analysis.

Without performing a full analysis of our own as yet, we cannot divine every fallacy in the Bureau's analysis. However, some of the more obvious are as follows:

- Including the Desalter ready-reserve maintenance expenditures in the cost of obtaining forbearance agreements is misleading and completely unacceptable. Including it in this analysis is an insult to Congress and to the public. Desalter maintenance and pursuit of forbearance agreements are completely unrelated processes; either can quite obviously exist without the other. Linking them for the purposes of economic analysis in this report falsely inflates the costs of alternatives to operating the Desalter.
- Including \$2.4 million in research in the \$5.1 million annual cost of keeping the Desalter in ready-reserve mode is erroneous. The Desalter could be kept in ready-reserve without doing extraneous research. This is at best poor math and at worst a blatant effort to delude Congress. It needs to be backed out of the equation.
- While the analysis includes extraneous unrelated costs to estimate forbearance costs, it fails to include estimates of environmental mitigation costs for Desalter operations. The Bureau fails to note that operation of the Desalter would degrade the Cienega de Santa Clara but references studies with these conclusions (p.16); it is therefore appropriate to include the potential costs of avoiding, minimizing, and mitigating such impacts within the total projected cost of Desalter operation.
- Even using the Bureau's unrealistic assumptions, the analysis does not provide the accurate cost of operating the Desalter in its five-year and ten-year scenarios. By the Bureau's estimates, the Desalter would have to operate at one-third to two-third capacity for four years. Yet the analysis calculates cost of product water using the admittedly impossible assumption of full capacity. Operations at one-third and two-thirds capacity produce water not at the stated cost of \$305/acre foot, but at an estimated cost of \$689/acre foot and \$325/acre foot respectively. The Bureau should revise the report to accurately reflect the increased costs associated with necessary maintenance and system downtime. Assuming two years of operations at one-third capacity and two years at two-thirds capacity, as suggested in the Bureau's Gantt Chart (per HJA Consulting) product water in the five-year scenario averages \$466/acre foot.
- The low-end estimate of \$32/MWh for power costs to operate the plant is unrealistic. The best price available for a strip of power (four quarters averaged) on the bulk power market today on the southwest grid is approximately \$44/MWh, even assuming the plant will be operating during less expensive shoulder hours. While the bulk power market is arguably volatile, this is not a liquid market. The Forward Curve for the market does not predict excesses of supply over demand, and with build-out time for power plants of five to ten years, the Curve tends to be accurate. The low-end estimate used in

this analysis is unlikely to be available for a long-term contract in the massive quantity needed for full capacity Desalter operations.

- The report fails to analyze a one-time cost of decommissioning the Desalter as an action the Bureau of Reclamation can take to reduce the high annual operation and maintenance costs of the Desalter. This alternative should be compared against keeping the Desalter in ready-reserve mode and/or operation of the Desalter at various partial or full capacity levels.

Operations Decision Criteria

The Bureau stated in its presentation that decisions on the percentage of capacity at which the Desalter would be operated would be made annually. Yet the Bureau was unable to adequately answer our question concerning what the decision criteria will be. Please answer the following questions regarding operating capacity and decision criteria: · What are all the elements of the decision criteria? · What will be the timing of determining percentage of capacity for operations? · Who beside the Bureau will participate in developing and applying the criteria? · Will the development of these criteria be subject to public review? We have similar concerns and questions regarding the replacement criteria (p.20).

Scientific Debate The report states that "Operation of the YDP would decrease the volume and increase the salinity of bypass water reaching the Cienega and may degrade its ecological value. Operation of YDP would be met with substantial controversy, and additional scientific debate." (page 5) The phrase "additional scientific debate" has not appeared in previous drafts: why was it included in this draft? The disruption of bypass flows to the Cienega in 1993, due to flood damage and subsequent repairs of the bypass canal, significantly degraded the Cienega. These impacts are clearly documented in the scientific literature. If, as we suspect, the Bureau is unable to document any "debate" about the expected degradation of the Cienega due to Desalter operation, then all references to "scientific debate" should be expunged from the report.

Federal Obligation Previously, we disputed the Bureau's apparent claim that the "interim period," in which the United States received credit for the Coachella Canal Lining Program, had ended. Given the Secretary's decision to reduce California water orders to 4.4 million acre-feet for calendar year 2003, we believe that this "interim period" has ended. Given that the Secretary authorized the delivery of some 200,000 acre-feet of additional Colorado River water to California's agricultural contractors last November – despite the existence of extraordinary drought throughout the basin – it is quite clear that the interim period was in effect through 2002. Further given that the Coachella Canal Lining Program salvages some 132,000 acre-feet per year, 24,000 acre-feet per year more than flows to Mexico via the Bypass Drain, and that there has not been a flood release from Hoover Dam since 1999, it is reasonable to assume that the United States has accumulated 72,000 acre-feet of bypass-flow credits, that can be applied to the current year's obligation. This federal credit should be noted in the report.

Water Supplies and Needs While we understand the concerns surrounding tightening water supplies, particularly those of Arizona contract holders, we do not trust in the

rationale that operation of the Desalter seeks to address those concerns (p.14). Were the Bureau truly interested in alleviating the pressures on Lake Mead storage and lower priority water users, this interest would be reflected in other Bureau proposals and policies – unfortunately, it is not. For example, in the FEIS for the Inadvertent Overrun and Payback Policy, the Bureau would allow any and all debt to be forgiven in the event of a flood control release. If the Bureau were aiming to maximize water storage, the agency would require full payback of all debt.

Thank you for the opportunity to comment. We hope these concerns will be accommodated in a new draft report. However, should you continue to include the elements that we find objectionable, we insist that you adjust the language of the report under “Consultation with Affected and Interested Parties” to remove any implication that we concur with the report as written. This could be effected by changing the last sentence at the end of that section to read, “This report of the Secretary of the Interior reflects the views and proposals of the Department after consideration of the comments and suggestions received in that review process. It does not reflect a consensus of the parties with which the Bureau of Reclamation consulted, nor does it represent a compromise between the different views expressed.” Should this report go forward with elements that we find objectionable and an implication that we concur with those elements, we certainly would not hesitate to contact members of Congress on our own to expose the deception being waged by the Department.

Please don’t hesitate to contact us if you have questions. Thank you.

Sincerely,

Writers on the Range: Lake Powell--Going, going, gone?
by John Weisheit

Who would have believed it? Water levels at Lake Powell have dropped to 50 percent for the first time since it filled in 1980. This draining is likely to continue to the point where the reservoir could vanish in the next three-to-four years.

With snowpacks below 25 percent of normal, and continued warnings from the U.S. Geological Survey, EPA and others that a severe and sustained drought should be anticipated, Lake Powell's days may be numbered. A 1995 study published by the American Water Resources Association predicted that a severe drought would lead to Lake Powell's draining within eight years. Things are right on schedule.

Now that Lake Powell is down by some 87 feet, three boat ramps have been closed: Antelope Point, Stateline and Hite. The National Park Service is working with a \$3 million emergency appropriation to extend other ramps as the reservoir continues to decline. But construction of the recently approved \$70 million Antelope Point marina complex is in limbo, because boats can't be launched from what has been revealed by drought to be a cliff.

Once Lake Powell drops an additional 28 percent, it will no longer generate hydroelectricity because Glen Canyon Dam's penstocks will be exposed, and water will no longer be able to turn the generators. There's also a problem with sediment, since fluctuating river flows that occur during low reservoir levels will speed the movement of sediment toward Glen Canyon Dam.

The U.S. Geological Survey says that major droughts of the past, such as the years from 1942 to 1977, went largely unnoticed. We notice this drought because the West has four times the population and we've been mining our groundwater.

Federal scientists have also informed us that the previous century was 20 percent wetter than normal. That means our ability to put water to work was helped by luck as much as it was by massive engineering projects. Even at those inflated levels, Colorado River water allocations are 20 percent above what the river delivered.

We've managed to avoid crises in the past because not all the Colorado River Basin states used their full allocations. Even so, the river reached the sea only twice in the past two decades. Add to all this a drought cycle that is predicted to last 25 years, and Lake Powell, along with every other reservoir in the upper Colorado River storage system, won't have water to store.

Vanishing bodies of water in the Western United States shouldn't surprise us: It's part of our legacy. In 1890, the Geological Survey's first professional paper discussed the principles of global climate change. The publication analyzed how a body of water that was once 800 feet deep -- Lake Bonneville -- had reduced itself into the briny and shallow Great Salt Lake.

In the 19th century, the physical geography of the planet provided undeniable evidence that humans can become victims of climate change. In the 20th century, we gained new tools, such as tree-ring data, that allowed us to reconstruct the climate of the last 400 years. This reaffirmed that the Earth's climate varies dramatically. Whether these changes result from the effects of greenhouse gases or from natural cycles, the results are the same.

Scientists have given us ample warning, but our water-management experts don't listen. At a recent gathering in Moab, Utah, John Keys, Commissioner of the Bureau of Reclamation, worked to calm the fears of those concerned that the Colorado River may soon be unable to provide for the 25 million people plumbed into his system.

"They (the reservoirs) are doing exactly what they were designed to do," he said. But when it was pointed out that these reservoirs are declining over 10 percent per year, and thus could empty in another five to six years, he had no plan for how the federal government would handle the shortages.

Certainly many of us will be pleased to see the uncovering of Glen Canyon. It will be nature's way of reminding us that we are not in control.

It would be truly unfortunate, however, if the warnings these declining levels represent are not heeded, and all those presently reliant on the overuse of Colorado River water get plunged into a crisis with no plan of action.

John Weisheit is a contributor to Writers on the Range, a service of High Country News in Paonia, Colorado (hcn.org). He is conservation director of the nonprofit group, Living Rivers, in Moab, Utah.

Take Action 03/07/03

Cienega de Santa Clara Needs Your Support!

Please read and respond to our summary of the Bureau of Reclamation's Draft 28 Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act. If the proposal put forth in the BuRec document were to be accepted, the already imperiled Cienega de Santa Clara in the Colorado River Delta could be decimated.

Background: Under the Colorado River Basin Salinity Control Act of 1974 (PL 93-320) (CRBSCA), the United States has had to bypass the highly saline agricultural drainage from the Wellton-Mohawk district through the MODE canal, in order to meet the salinity requirements of the Act. The discharge inadvertently revived the Cienega de Santa

Clara, a rich 14,000-acre wetlands, home to several endangered species and an important stop for migrating birds on the Pacific flyway. The Cienega and 90% of the delta region in which it exists was destroyed when water diversions from the Colorado River by the United States and Mexico left nothing but unscheduled reservoir "spills" to water the formerly two million acre biologically diverse region.

The CRBSCA authorized building the Yuma Desalting Plant (YDP) to desalinize the agricultural drainage. But the plant was never operated at more than one-third capacity and for more than a few months because it was not economically viable. Water produced by the YDP would come at an estimated cost of \$400 - \$900 per acre foot. By comparison, farmers in the Yuma area pay an average of \$12 per acre foot.

Summary:

The draft report, Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act, sets out the Bureau of Reclamation's (BuRec) case for operating the YDP, thereby reducing bypass flow to the Cienega de Santa Clara. At full operating capacity, the Cienega would receive only the intensely saline brine from the YDP process, which would completely destroy the wetlands.

The BuRec views the bypass flow to the Cienega as lost water because it does not count as part of the U.S. obligation of water delivery to Mexico. The amount of bypass flow is ~108,000 acre-feet per year and this bypass water has an average salinity on the order of 2800 ppm.. The YDP operations would treat Wellton-Mohawk agricultural drainage water and return it to the Colorado basin where it could be included as part of treaty obligation to Mexico at the Northern International Boundary.

The draft report exists as the basis from which BuRec can make funding requests to support forbearance agreements and request funds to ready YDP to operate at full capacity. The draft report states that the Cienega de Santa Clara has been created, but does not detail the Cienega's history of having been a component of the pre-dam wetland complex along the Colorado delta. As well, it offers no plan for supporting existence of the Cienega. The report states that the bypass drainage to the Cienega has been at the discretion of the U.S.

The next step for the BuRec after submitting this proposal to Congress is to "move forward with the expenditure of funds to implement" their proposed measures. In truth, BuRec has already increased its funding for the YDP in 2003, and is working to correct six areas of plant deficiencies by the end of the year. Further appropriations appear to have been requested and included in the 2004 appropriations draft.

The proposal finds its justification in this reasoning: "Because the drainage water in the bypass is not desalted and returned to the River, the [current] method of operation results in the release from Lake Mead of comparable quantities of water, which otherwise would not be needed if the bypassed water was delivered to Mexico as part of the U.S. Treaty delivery obligation." The Bureau argues that this aggravated water shortages in the Colorado reservoirs. The report notes that "tightening water supplies and increased demands has raised important concerns" especially from Central

Arizonan Water Conservation District, which operates the Central Arizona Project (CAP).

The 108,000 acre-feet bypass flow to Cienega represents less than one percent of the average annual flow of the Colorado River's 12 million to 15 million acre feet. The Cienega is an incredible wetland with a diverse vegetation structure that supports an equally diverse population of birds and animals including the federally listed endangered Yuma clapper rail and the desert pupfish. The result of operating the YDP would be to cutoff flows to the Cienega so that 108,000 acre feet more of the U.S. excess water reserves could stay in its impoundments, much of it to evaporate.

The draft report explains that a "thorough environmental review of the original EIS (which dates from 1975)" would be undertaken. However, the environmental review with regard to the effects on the Cienega is largely irrelevant since the Cienega is located in Mexico. In response to a lawsuit brought by Environmental Defense against the BuRec concerning Colorado River delta species, the agency claims it is not responsible for the impact its operations have on endangered species that exist across the international border. In addition to an environmental review, the draft report states that under Section 402 of the Clean Water Act, a discharge permit must be obtained to transfer desalted product water to the Colorado River.

The report includes a section on Environmental considerations relative to the bypass flow and discusses the Cienega and its Biosphere Reserve status (p.14). The document states that "reduction of current bypass flows will be met with substantial controversy." However the document says an environmental review will be conducted but makes no proposal for sustaining the Cienega. The reader is forced to assume that if this proposal is allowed to go forth, the Cienega's outstanding ecological value will be severely compromised. Biodiversity will receive a crippling blow.

In the report section subtitled "Potential Sources of Replacement Water to meet Title I objectives" (p.17) it stated that replacement supply for bypass flow to the Cienega must come from inside the Colorado River Basin. "The primary source of replacement water for flows in the Bypass Drain is expected to be from the Lower Basin agricultural water users, and recovery and return of Colorado River water that would otherwise be lost to Mexico as groundwater. About 4.9 million acre-feet per year of Colorado River water is used in the Lower Basin for agricultural purposes...(p.17)" The report states that this fact should yield "opportunity for the program and water agencies to acquire additional water."

The alternative most fully explored is forbearance, essentially short-term leases of water from area agricultural interests. The cost of forbearance agreements is estimated to be \$60 to \$309 per acre foot. Living Rivers research has shown the least valuable production of crops in the area to be worth \$53 per acre foot of water. The BuRec estimate of \$60 per acre foot is realistic. However, in order to make the YDP operations appear economically feasible compared to the environmentally responsible alternative of leasing water, the agency had to include a highly exaggerated higher cost estimate. In order to reach the \$309 per acre foot estimate, the agency included the cost of keeping the YDP in "ready reserve."

Since 1992, the YDP has been maintained on standby - or ready-reserve - at an annual cost of ~\$5.1 million. This cost includes \$2.4 million of general research concerning desalting plants. Keeping the plant in ready-reserve mode obviously has nothing to do with seeking water leases. Including the cost in alternatives to operating the YDP is a blatant lie.

The report mentions the alternatives of "extraordinary conservation" such as upgraded irrigation systems for farmers in the lower basin. It does not however develop these alternatives nor does it state even an estimated cost for these alternatives.

The draft report explains that the YDP operation would cost \$26-34 million yearly. The other effect the report mentions is that water flowing to the Cienega would be decreased to reject brine. According to report predictions, the flows would be reduced to 30,000 acre feet yearly with an average salinity of ~9000ppm . The annual amount of water the YDP is predicted to process is 60,700 acre-feet to 75,400 acre-feet. Then the BuRec would blend that product water with 10,000 acre-feet per year of untreated agricultural drainage water (p.15) yielding a complete return to the Colorado (when YDP is operating at full capacity) of 70,700 to 85,400 acre-feet.

The BuRec predicts that desalted product water from the YDP at full capacity operation will cost between \$305 and \$480 per acre-foot. The estimates are based on completely unrealistic assumptions including insanely low power costs, and do not take into account that the plant cannot operate at full capacity for at least four years. At one third capacity, even the BuRec's unreasonably optimistic estimates show a cost of \$689 per acre foot of product water.

The report concludes that BuRec intends to follow a two-pronged strategy of pursuing forbearance agreements and readying the YDP for operations.

Living Rivers and a network of other environmental groups in the US and Mexico do not intend to allow a thriving wetland to die. Nor should the phenomenal cost of operating the YDP be imposed upon taxpayers particularly in a time of national economic distress. We will be preparing comments to the BuRec report as well as our own report to Congress about the real economics of operating the YDP versus pursuing lower-cost and environmentally responsible options.

Please send the BuRec a message that their report to Congress is irresponsible and unacceptable in the fallacies it includes as well as in its erroneous conclusion. Send comments by March 31, 2003 to:

Letter to LR 03/14/03

To Gale Norton Demanding Immediate Action on Colorado River Drought

Honorable Gale Norton
Secretary, United States Department of Interior
1849 C Street, NW
Washington DC, 20240
Dear Secretary Norton,

We are writing to seek your cooperation in averting the emerging social, economic and ecological crises related to Colorado River water availability. Although snow packs in the basin are improving, river flows are again predicted to be below normal for the fifth straight year. According to the National Oceanographic and Atmospheric Administration, the current El Niño event has, "reached its mature stage and is expected to weaken." Basin-wide storage is at an all-time low. With federal water allocations continuing to exceed natural deliveries, the region is quickly nearing the halfway point to catastrophe. It is vital that federal, state, Indian tribes and private groups begin developing a framework for revisiting Colorado River water allocations and the laws which govern them.

We fully appreciate the political, economic and legal complexities associated with re-opening discussions pertaining to the Colorado River Compact and the Law of the River. However, the warning signs of system collapse are apparent. Storage in reservoirs is less than 60 percent of capacity and declining at a rate of more than ten percent per year. The Geological Survey cautioned last year that Western water managers should be prepared for below average precipitation over the next several decades. They caution that "a repeat of the 1942 to 1977 drought could be catastrophic" given the Colorado Basin's increased population growth.

If precautionary mechanisms are not put in place shortly, a crisis of unquantifiable proportions could easily unfold. Ten percent of the nation's population relies on

Colorado River water, including the metropolitan areas of Los Angeles, Phoenix, Las Vegas, Salt Lake City, Albuquerque, San Diego and Denver. A \$1.5 billion agricultural industry and 4200 megawatts of the Southwest's energy supply could be severely impacted. Yet, Bureau of Reclamation Commissioner John Keys stated on February 13 that his agency has no plan for how to allocate water once major shortages occur.

Such complacency will not only burden the Southwest's economy, but the federal treasury and judiciary as well. Emergency funds will be sought to compensate irrigators who shift their water to municipal users. Major lawsuits will materialize as Western states and water users battle the federal government over control of water rights. Further compromises regarding in-stream flows will burden federal courts with additional environmental complaints. Unless timely, pro-active measures are taken, an extensive amount of federal, state and local resources will unnecessarily be poured into crisis management.

Such an atmosphere will exacerbate tensions amongst competing interests and further complicate efforts to establish realistic long-term Colorado River management strategies. Given the present allocation system, it is not a matter of if, but rather of when, the Colorado River storage system will be unable to meet demand. Scientists have determined that the actual average flow of the Colorado River at Lee's Ferry is 20 percent below the original Compact allocations. The data also reflects that the Colorado River flow during the current drought cycle has been 15 percent lower than during the first four years of the 1942-1977 drought. Additional reservoirs will not solve the problem; new strategies for water allocation and use must be developed as soon as possible. We seek your commitment toward helping to establish a dialogue amongst the basin states, water users and environmental groups in order to begin tackling this critical problem.

The federal government has primacy over Colorado River management; you are the basin's legally designated Water Master. The Colorado River is held in trust for the benefit of the public, and it has become obvious that its management can no longer be relegated solely to the basin states. Uniform leadership, authority and policy development must come from the Department of the Interior. Your action at the end of last year to limit California and Nevada's deliveries to their prescribed allocations was a positive first step. We now encourage you to begin a thorough overhaul of the Colorado River Compact--one that realistically reflects present use patterns and anticipated river flows. At a minimum, water allocations need to be reduced to reflect actual historical river flows.

Bringing the basin's water use into balance with natural flows will be much easier, far more efficient and certainly less costly than the monumental engineering works of the past have been. In fact, as was calculated by the late Walter B. Langbein, the Colorado River Basin's reservoirs' evaporation and seepage losses far exceed the benefits of the additional water storage they provide.

In order for the Department of the Interior to realize a reduction in water allocation, a top priority should be the establishment of water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80

percent of Colorado River water not destined for Mexico; programs should be established to aid irrigators in replacing water-intensive feed crops, such as alfalfa, with produce crops that use significantly less water per acre. Such measures could reduce irrigation consumption in the Colorado River Basin by half, thereby freeing up more water than is presently being used by all the municipalities currently plumbed into the Colorado River system.

The historical theory underlying Colorado River law and management is that in years of below-average river flow the sixty million acre-feet of storage built into the system will act as an insurance policy against the effects of cyclical drought. But we are becoming increasingly aware that such insurance is not limitless. Increasing water use within the basin and changing climatic conditions are driving the system to the breaking point. This need not occur. A vast amount of additional water management understanding and experience has been accumulated since the Colorado River Compact was first crafted. The Colorado River can accommodate the future needs of the Basin states, Indian tribes and Mexico as well as the natural environment. This important goal will most effectively be accomplished when the Department of the Interior takes the lead in the evolution of management policies which recognize the Colorado River's inevitable constraints.

Thank you for your attention to the matter, and we look forward to your reply (transcribed below).

Sincerely,

Owen T. Lammers
Executive Director

cc: John Keys, Commissioner, Bureau of Reclamation

Commissioner Keys responds to LR letter United States Department of the Interior
Bureau of Reclamation
Washington, D. C. 20240
In Reply Refer To:
W-6333 June 17, 2003
ADM-13.00

Mr. Owen T. Lammers
Executive Director, Living Waters [Rivers]
P.O. Box 466
Moab, Utah 84532

Dear Mr. Lammers:

Thank you for your letter to Secretary of the Interior Gale A. Norton dated March 14, 2003, regarding Colorado River issues. The Secretary has asked that I respond to you

on her behalf. Similar to other Western rivers, the Colorado River Basin has experienced four dry years, some of which having been among the driest on record. With such a significant part of the nation dependent on water supplies from the Colorado River, it is truly fortunate that we continue to enjoy the benefits of our existing water supply facilities that help to mitigate to make up for these tough years of insufficient moisture.

As you point out in your letter, these issues are complex and sometimes contentious, and it gives me a perfect opportunity to mention the Secretary's new initiative, entitled Water 2025: Preventing Crises and Conflict in the West. Water 2025 recognizes the realities we face in dealing with water issues, such as explosive population growth, increasing needs for water for environmental and recreational uses, and the national importance of food and fiber production from Western irrigated agriculture. Water 2025 sets forth a strategic plan to facilitate a vigorous and educated public discussion in key Western communities, including those that rely on the Colorado River, where the likelihood for conflict and crises over water exists or can be predicted to occur by the year 2025. I invite you to attend and participate in any of the eight regional consulting sessions hosted by the Bureau of Reclamation. The information on these sessions is located on our website, www.doi.gov/water2025.

Again, thank you for your comments and concerns about Colorado River issues. The Colorado River has been and will continue to be a top priority for our agency, and I look forward to working with you and your organization in the constructive and positive manner set forth in Water 2025.

Sincerely,

John W. Keys, III
Commissioner

**El Niño provides no Drought Relief
Colorado River Storage at lowest levels in history
"Drought Watch" Campaign demands Federal Action to Avoid Catastrophe**

The National Oceanographic and Atmospheric Administration reported on March 3, 2003 that the current El Niño event has, "reached its mature stage and is expected to

weaken." What was hoped to provide a break from several years of below average precipitation, has only brought snow packs to 80 percent of normal. The result: water use in the Colorado watershed will again outpace river deliveries, causing reservoir levels to decline for the fifth year in row.

As of today, levels in the Colorado watershed's primary reservoirs are at an all time low of 59 percent, declining at a rate of ten percent per year. Abundant historical evidence reveals that the present drought is far from unprecedented, and warnings from the United States Geological Survey one year ago urged water managers to be prepared for several decades of below average precipitation. They cautioned that "a repeat of the 1942 to 1977 drought could be catastrophic," given the Colorado Basin's increased population growth and water use. River flow during the current drought cycle has been 15 percent lower than those at the beginning of the 1942-1977 drought.

However, on February 14 Commissioner John Keys of the Bureau of Reclamation stated that his agency had "no plan" for how the federal government would handle water shortage once reservoirs began running dry. The Bureau of Reclamation has merely continuously revised its over-optimistic hydrologic forecasts for river flows. The most recent, on March 3, was a 25 percent downward revision for flows into Lake Powell, the principle figure for determining water availability for California, Arizona and Nevada. In October, 2002 BuRec predicted flows would be 10.14 million acre-feet in the water year of 2003. Now they are predicting only 7.44 million acre-feet, 62 percent of normal.

"This is nothing more than the beginning of an Enron event for the 25 million people reliant on the Colorado River water," said Owen Lammers, executive director of Living Rivers, the Colorado River's principal advocacy organization. "The Bureau of Reclamation puts out inflated projections to give the public a false sense of security, meanwhile the Basin's bank accounts are going down, down, down."

In a letter sent today to Secretary of Interior Gale Norton, on the occasion of the sixth International Day of Action Against Dams, and for Rivers Water and Life, Living Rivers demanded urgent action by the Colorado River's legally designated Water Master. As an initial step, Living Rivers is seeking the Secretary's commitment toward helping to establish a dialogue amongst the basin states, Indian tribes, water users and environmental groups, to begin tackling this critical problem.

The letter outlines two key challenges that need to be addressed.

- Bringing the basin's water use into balance with natural flows by re-negotiating the water allocations established in the Colorado River Compact. These allocations are 20 percent above what the river deliver in years of average flow.
- Establish water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80 percent of Colorado River water, much of it for water intensive and low value crops, such as alfalfa and other feed crops for livestock.

"The Colorado River can accommodate the future needs of the Basin states and Mexico as well as the natural environment. This important goal will most effectively be accomplished when the Department of the Interior takes the lead in the evolution of management policies which recognize the Colorado River's inevitable constraints," the letter from Living Rivers states.

Living Rivers has established "Drought Watch" as an urgent campaign focus to provide the public with accurate information about the decline in water availability in the Colorado River watershed, and opportunities for the region's water users to alter their consumption patterns without jeopardizing the meeting of human needs, the economy or the environment.

Conservationists Bemoan Diversion of Water From Moab's Mill Creek

SALT LAKE TRIBUNE
BY LISA CHURCH

MOAB -- Grand County's water policies are destroying a sensitive riparian area and threaten to further damage the Colorado River watershed, water conservation activists say.

About 80 rallied Friday in Moab to protest those policies, an event that coincided with the sixth annual International Day of Action Against Dams and for Rivers, Water & Life.

Speakers at the rally, sponsored by Living Rivers, a Moab-based nonprofit group, accused the county of "putting greed before the welfare of the community." The activists contend the Grand County Water Conservancy District diverts too much water from Mill Creek, a stream that originates with runoff from the La Sal Mountains and flows more than 25 miles through Moab, emptying into the Colorado River. The water winds up in Ken's Lake reservoir, the main source of irrigation water for about 125 farmers and ranchers in the county's southern reaches.

"Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted," said John Weisheit, conservation director for Living Rivers. "Mill Creek's ecology is being destroyed."

Last month, the district petitioned the federal Bureau of Land Management for permission to reduce by half the amount of water it leaves in the stream below Ken's Lake, a move Weisheit said would devastate Mill Creek's native plants and fish. The BLM denied the request. Meantime, the Grand Water and Sewer Service Agency, of which the district is a part, has approved a feasibility study on the cost of diverting Colorado River water to Ken's Lake. The agency owns rights to 10 cubic feet per second of water but has never exercised them because it had no way to get the water to the reservoir.

Increasing Mill Creek's flow is essential to maintaining a healthy riparian area, said Lee Goodman, of Moab.

"Mill Creek is everything people create in their myths as an idyllic place. When you've got something as gorgeous and as important to the human spirit, one shouldn't have to argue over how much water it can have," Goodman said.

Agency manager Dale Pierson said Friday that Grand County water districts encourage conservation. In recent years, he said, district users have reduced water consumption by 25 percent, the state water conservation standard, and last year water use was down by 28 percent from 2001.

"We're doing pretty well, but we can do better," Pierson said. "We want all our customers to be conscious of water use, and to conserve as much as possible."

He said the proposed \$20 million Colorado River plan would add additional water to Ken's Lake that the district would use to establish a separate valley-wide irrigation system. That way, customers who now use water from the culinary system to water lawns and gardens could save money and help the agency cut back on the amount drawn from its aquifer.

However, he said, "We won't build it if it isn't feasible for water customers."

Troubled Delta: Help Save What's Left

For the past year, Living Rivers has been working to stop the Bureau of Reclamation (BuRec) from destroying the most functional piece of Colorado River delta habitat, the Cienega de Santa Clara. BuRec is preparing to submit a report to Congress that recommends the diversion of Cienega water to BuRec's Yuma Desalting Plant. Public input is needed now to help influence this report before it is finalized, as well as letters to Congress once it is submitted.

This rich 14,000-acre biosphere reserve in Mexico receives the only constant flows in the entire two-million-acre delta region. As such, it provides critical habitat for a number of endangered species, and especially for waterfowl traveling the Pacific Flyway between Alaska and South America. The Cienega and 90 percent of the surrounding delta region was destroyed when water diversions from the Colorado River by the United States and Mexico began taking every drop. The Cienega has been revitalized, however, as a result of irrigation drainage from southwestern Arizona that has been diverted into Mexico. BuRec now wishes to capture all this drainage water, and divert it through its mothballed desalting plant in Yuma, Arizona.

BuRec's motive is to add an additional 108,000 acre-feet of water back into the Colorado River, so that a similar amount could be used by farmers upstream. Finally completed in 1992 at a cost of \$253 million, the Yuma Desalting Plant was slated to treat irrigation drainage water and to ensure that water delivered to Mexico met agreed upon water quality standards. However, given the plant's operation costs of \$36 million annually, it has been more economical to obtain the 108,000 acre-feet of water from California, and allow the drainage water to flow on down to the Cienega. Starting up the plant will have the reverse effect—an ecological disaster for the Cienega, and an unnecessary economic burden for US taxpayers.

On March 7, Living Rivers, Defenders of Wildlife, Pacific Institute, Sierra Club, Environmental Defense and Southwest Rivers jointly submitted a critique of BuRec's most recent draft report to Congress. Among the most blatant omissions were hardly any reference to the Cienega and the ecological impacts associated with the loss of its only water source. There was also no mention of the federally listed endangered species that would be affected by taking this water, including the Yuma clapper rail, desert pupfish and black rail.

To improve the economic picture, BuRec overestimated the desalting plant's output, causing the average price per acre-foot of water produced to be 33 percent lower than what would actually occur. A similar error was made in calculating the plant's primary operating costs: electricity. BuRec used a price of \$32 per megawatt hour, when the actual price is \$44. BuRec hopes that such faulty analysis will not be questioned by Congress, nor that Congress will ask for alternative methods of achieving the required water quality standards.

In fact, the draft report did not address long-term alternatives at all. Living Rivers' analysis reveals that water rights could be purchased or leased from Arizona irrigators at a cost of 75 to 85 percent less than the cost of desalting the drainage water via the Yuma plant. By not relying on the operation of the plant, it can be permanently decommissioned, saving tax payers an additional \$5.1 million annually.

Please join Living Rivers in demanding that a more thorough economic and alternatives analysis be undertaken by BuRec before they submit their report to Congress. Write to: Robert Johnson, Regional Director; Lower Colorado River Region, U.S. Bureau of Reclamation; PO Box 61470; Boulder City, NV 89006-1470; Fax: (702) 293-8614; Email: BJohnson@lc.usbr.gov.

Living Rivers Currents 03/19/03

Mill Creek: Microcosm of the Colorado River

In conjunction with the sixth International Day of Action Against Dams, and for Rivers, Water and Life, Living Rivers initiated a campaign to help revive a small tributary of the Colorado River running just 300 yards from its Moab offices. About 80 people turned out for the noon time rally on March 14.

Mill Creek drops 7,000 feet from the La Sal mountains to its confluence with the Colorado River, 25 miles away. Just like the Colorado, Mill Creek runs dry before reaching its final destination; can no longer support endangered native fish; sees most of its water diverted for taxpayer-subsidized alfalfa irrigation; and receives limited public involvement in decisions affecting its future.

Living Rivers' objective is the return of year-round stream flow by mobilizing public support to reduce the need for extensive diversions. On any given year, from 15 to 40 percent of the water diverted from Mill Creek is lost to leakage in the system's principal

reservoir, Ken's Lake. Additionally, the agency responsible for managing this facility often takes more water from the creek than is allowed by their water right. Merely correcting these problems would go a long way toward reviving Mill Creek.

More important are the implementation of programs to help farmers who are potentially interested in making the transition to more water-efficient, higher-value crops. For example, alfalfa can require four times as much water as grapes, and provides the farmer with a crop that yields only \$100 per acre-foot of water, whereas good quality grapes can yield \$7,500 per acre-foot. Living Rivers is advocating similar alternatives for those who use Mill Creek water for water-intensive ornamental landscaping—promoting a switch to drought-tolerant native plants to keep more water in the creek.

Living Rivers Currents 03/19/03

Lake Powell: Running Out of Reservoir

Lake Powell reservoir is down 91 feet from normal; it is officially half empty. The last time it was at this level was 30 years ago when the reservoir was first filling. According to a report that was published in October 1995 by the American Water Resources Association, should a severe and sustained drought similar to past events occur, Lake Powell reservoir is likely to stay empty for approximately eight years.

The National Park Service, which oversees the marina facilities at Lake Powell, has had to make several adjustments to keep the facilities operational since last summer. Despite these adjustments, three boat ramps are presently closed and the ferry service between two other marinas is also shut down.

Additionally, the recently approved \$70-million Antelope Point Marina Resort is in jeopardy of being built but never used. To be operational, this facility is totally dependent on having a full reservoir. Right now, at Antelope Point, the reservoir is confined between the sheer vertical cliffs of the original Colorado River canyon and is inaccessible. When considering the demand for water in the lower basin states of California, Arizona and Nevada, compounded by the growing realization that a severe and sustained drought is already upon us, it is possible that the resort may not be useable for decades.

At the top of the reservoir, where the Colorado River enters, major sediment problems are surfacing. The sediment deposits of the last 40 years have built a substantial delta forcing boat ramp and campsite closures, and will eventually engulf the concession facilities and the culinary water intakes.

This situation is also causing extensive complications for white water rafters whose multi-day trips through Canyonlands National Park end at Lake Powell. Their primary facility for getting off the water, Hite Marina, is effectively shut down due to sediment. It's difficult for land vehicles to get close enough to the water without getting stuck. This

could be a major problem for the multi-million-dollar commercial rafting industry that relies on this stretch of the Colorado.

It has been anticipated that the upcoming snowmelt, and the consequent reservoir rise, might bring some relief for the facilities. But a current projection supplied by the Bureau of Reclamation does not support such a hope and indicates lowering will continue through the middle of summer. The snowmelt will actually serve to aggravate the situation because the increased river flows will erode and mobilize the suspended sediments upstream, and then redeposit them at Hite Marina where the Colorado River delta is currently expanding.

Decreased recreation is not the only potential impact of the lowering reservoir. If the present drought does not relent, within three years Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam.

This problem is not just indicative of Lake Powell. The entire Colorado River storage system has dropped from 92 to 59 percent over the past 40 months. In Arizona, a reservoir on the Verde River is completely empty. A reservoir on the Gila River is four percent full and Lake Roosevelt reservoir on the Salt River is 14 percent full. "Lack of access to flat water recreation is the least of our worries," says Owen Lammers, executive director of Living Rivers. "The Southwest plumbing system is headed for complete catastrophe and the Bureau of Reclamation, together with the seven states that use Colorado River water, have no disaster preparedness plan." For ongoing updates, visit "Drought Watch" at the Living Rivers web page.

Living Rivers Currents 03/19/03

Flaming Gorge: EIS to be Released

After nearly three years, the Bureau of Reclamation (BuRec) will soon be releasing its draft Environmental Impact Statement (EIS) for the reoperations of Flaming Gorge Dam. The purpose of this EIS is to recommend changes in dam operations to improve habitat for endangered fish along the Green River and in Dinosaur National Monument—the humpback chub, razorback sucker, bonytail chub and Colorado pikeminnow.

For a long time the operation of Flaming Gorge Dam has caused harm to native fish. The introduction of a successful fishery for non-native trout in the dam's tailwaters is a testament to the

conditions existing downstream of the dam that make the river inhospitable for native species, which require warmer water for successful spawning and survival. The reservoir traps vital sediments behind the dam, thereby inhibiting sandbar- and beach-building habitat necessary for protecting juvenile fish. The dam, which has no fish passage structure, forms a reservoir which is used and managed for a recreational sport fishery for several non-native species known to prey on endangered native fish. Conditions are marginal at best for endangered fish survival in the reservoir as well as downstream.

In 2000, Living Rivers formed a nationwide coalition to demand that BuRec fully consider the decommissioning of Flaming Gorge Dam as the most viable alternative to ensuring the recovery of native fish habitat in Dinosaur National Monument. Although a rather significant structure, Flaming Gorge Dam stores very little water, and generates an insignificant amount of hydroelectricity. Its decommissioning, along with that of the much smaller Fontenelle Dam upstream, would allow the Green River to again flow wild and free.

To obtain a copy of the draft EIS, write to: Beverly Heffernan; BuRec; 302 East 1860 South; Provo, UT 84606-7317; (801) 379-1161; Fax: (801) 379-1159; Email: bheffernan@uc.usbr.gov. Keep an eye on our web site for more detailed information once the draft EIS has been released.

Living Rivers Currents 03/19/03

Drought Watch! Demands Action to Avoid Crisis

Reservoir levels in the Colorado River watershed are at their lowest point in history. Over the past three years, they have been declining at a rate of ten percent per year and are now at 59 percent of capacity—an approximate three-year supply for the basin's 25 million residents and farmers. While historical evidence reveals that the present drought is not unprecedented and is likely to continue, the basin's water managers remain unconcerned.

The most recent sustained drought in the basin took place between 1942 and 1977. The regional climate was marked by less snow and fewer summer rains. No major crisis surfaced because Colorado River consumption was much lower than today. Last year the United States Geological Survey warned that a repeat of this drought could be "catastrophic." It is already shaping up to be much worse than the previous one. River flows during the first several years of the present drought are 15 percent below what they were when the 1942 drought began. Despite hopes that an El Niño event would

generate above-average precipitation this year, the most optimistic forecasts now call for snowpacks of 20 percent below normal.

When these issues were raised to Commissioner John Keys of the Bureau of Reclamation (BuRec) last month, he stated that his agency had "no plan" for how the federal government would handle water shortages once reservoirs began running dry. BuRec has merely continuously revised its over-optimistic hydrologic forecasts for river flows. Its most recent, on March 3, was a 25 percent downward revision for flows into Lake Powell. In October 2002, BuRec predicted flows would be 10.14 million acre-feet in the water year of 2003. Now BuRec is predicting only 7.44 million acre-feet—62 percent of normal.

According to Living Rivers' conservation director John Weisheit, BuRec is also overestimating the amount of available water in its reservoirs. "Their available water figures from Lake Mead and Lake Powell reservoirs do not fully account for the sediment which now occupies storage space. There are another two million acre-feet of storage losses, bringing the overall storage in the basin to 55 percent of capacity."

In a letter sent to Secretary of Interior Gale Norton on March 14, on the occasion of the sixth International Day of Action Against Dams, and for Rivers Water and Life, Living Rivers demanded urgent action by the Colorado River's legally designated Water Master. As an initial step, Living Rivers is seeking the Secretary's commitment toward helping to establish a dialogue amongst the basin states, Indian tribes, water users and environmental groups, to begin tackling this critical problem.

The letter outlines two key challenges that need to be addressed. First, bring the basin's water use into balance with natural flows by re-negotiating the water allocations established in the Colorado River Compact. These allocations are 20 percent above what the river delivers in years of average flow. Second, the federal government should establish water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80 percent of Colorado River water, much of it for water-intensive and low-value crops, such as alfalfa and other feed crops for livestock.

Mill Creek Rally organizers say Grand County water agency puts greed before welfare of land

Times-Independent by Lisa Church

Moab, UT - Grand County's water policies are destroying a sensitive riparian area and threaten to further damage the Colorado River watershed, water conservation activists said at a protest rally Friday.

The Moab event coincided with the 5th Annual International Day of Action Against Dams and for Rivers, Water & Life, and also commemorated the founding of Living Rivers, a

Moab-based non-profit group that promotes water conservation and restoration of Western rivers, officials said.

Speakers at the rally also accused the water agency of "putting greed before the welfare of the community."

Representatives from Living Rivers and other conservation groups say the Grand County Water Conservancy District annually diverts too much water from Mill Creek into the Ken's Lake Reservoir. Mill Creek originates with runoff from the La Sal Mountains and flows more than 25 miles through Moab, emptying into the Colorado River. It is the main source of irrigation water for about 125 farmers and ranchers in the county's southernmost reaches.

"Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted," said John Weisheit, conservation director for Living Rivers. "Mill Creek's ecology is being destroyed."

Last month, the district petitioned the U.S. Bureau of Land Management for permission to reduce by half the amount of water it leaves in the stream below Ken's Lake, a move Weisheit said would devastate Mill Creek's native plants and fish. The BLM recently denied the request, but activists point to it as an example of the agency's greed.

About 80 people gathered on the Grand County courthouse lawn to protest that request and a feasibility study approved by the Grand Water and Sewer Service Agency - the district's umbrella agency - to examine the cost of diverting Colorado River water to Ken's Lake. The agency owns rights to 10 cubic feet per second of water but has never exercised the right because it had no way to get the water to its reservoir.

Increasing Mill Creek's flow - the stream drops 8,000 feet through the mountains before reaching the Moab Valley - is essential to maintaining a healthy riparian area that is important to the community, said Moab resident Lee Goodman.

"Mill Creek is everything people create in their myths as an idyllic place. When you've got something as gorgeous and as important to the human spirit, one shouldn't have to argue over how much water it can have," Goodman said. "If you see your child being tortured right in front of you, it's important to stand up, to complain."

Agency manager Dale Pierson said Friday that Grand County water districts encourage conservation, and have been successful in promoting lower water use. In recent years, district users have reduced water consumption by 25 percent - the state water conservation standard - and last year, water use was down by 28 percent from 2001, he said.

"I think we're doing pretty well, but we can do better," Pierson said. "We want all our customers to be conscious of water use, and to conserve as much as possible."

He said diverting water from the Colorado River represents another step in reducing the amount of culinary water used by residents. The \$20 million plus project would add

additional water to Ken's Lake that the district would use to establish a separate valley-wide irrigation system.

"If this pipeline were built, customers who currently must use water from the culinary system to water lawns and gardens, could save money and help us cut back on the amount water drawn from our underground aquifer," Pierson said. "We won't build it if it isn't feasible for water customers."

Activists hope the public protest will promote dialogue between Grand County residents and water officials.

"We want to work within the community to create responsible water use and conservation with a goal of maintaining our rivers, streams, and ecosystems. But we must also look regionally to restore the balance because we share this area with Native Americans and their values, which are older than ours and more important actually," Weisheit said. "If we continue this way like other hydro-societies, we will lose it all."

LR Letter 03/20/03

Fossil Creek Restoration Threatened

March 20, 2003

Phil Smithers

Senior Designer

APS / Generation Engineering

P.O. Box 53933, m/s 3190

Phoenix, Arizona 85210

Dear Mr. Smithers:

RE: Concerns regarding the restoration of Fossil Creek as agreed upon in the Childs Irving Hydroelectric Project Settlement Agreement and Removal and Restoration Plan between Arizona Public Service and the Intervenor, dated September 11, 2000.

Thank you for submitting the "Childs-Irving Hydroelectric Decommissioning Update" dated February 03, 2003. We commend you for your work to support the decommissioning of the plants as agreed upon in the Offer of Settlement, Childs/Irving Hydroelectric Project, Project No. 2069 between the intervenors and Arizona Public Service, submitted September 15, 2000 and the Settlement Agreement (Agreement), dated September 11, 2000.

Your February 3, 2003 Update includes an item under "Ongoing issues related to decommissioning" which is of concern. It reads "Historical – The R & R plan for this project describes removal of the surge tank at the top of the Childs penstock and the removal of contents from the Childs powerhouse. SHPO has raised issues with both. We support leaving the majority of contents in the Childs powerhouse for historical purposes and never intended to gut the building. These are the only issues SHPO has at this time."

First, this is not an ongoing issue as the Agreement includes a Removal and Restoration Plan (Exhibit M) which was negotiated at length between the intervenors and APS, and for which input was received from the US Forest Service, SHPO and other agencies with a stake in the Proceedings. The Removal and Restoration Plan clearly states:

"The standpipe (30x30') shall be removed" (page 30); and "The Childs powerhouse shall remain as historical feature. All equipment, electrical, mechanical and maintenance will be removed" (page 31).

We will address the surge tank issue first. Leaving the surge tank in place is unacceptable.

Removal of the tank has already been negotiated and agreed upon as is stated in the Offer of Settlement (Offer) between APS and the Intervenor. SHPO and the USFS were both included in those discussions, as stated in the Offer (page 3), with the conclusion that the participants agreed to the Removal and Restoration Plan:

"These negotiations were designed to address the concerns of all interested parties, whether Intervenor in the relicensing proceeding or not. In fact, the settlement negotiations involved several additional parties that did not intervene in the relicensing proceeding, including ...the USFS,...State Historic Preservation Office...

"As a result of the collaboration discussed above, APS, the Intervenor and the Non-Intervenor have reached agreement for the surrender of the Project license and removal of the Project works, as described in the Childs/Irving Hydroelectric Plants Removal and Restoration Plan..."

The Agreement, Section 1.1 reads "The Participants have entered into this Agreement for the purpose of ...(b) approving the Removal and Restoration Plan..." (section 1.1) "The Participants agree that Project removal, under the terms and conditions of this Agreement, constitutes a reasonable resolution to the dispute between them..." (section 2.1)

Because the Agreement is in place and has been for more than two years, no further discussion of these items should be necessary. However, we will reiterate briefly, for the record why leaving the surge tank in place is unacceptable

The value of preserving the tank for historical interpretation is questionable. The surge tank is a simple symmetrical 30-foot by 30-foot pipe made of concrete. It includes no innovative design, no natural native materials and is of little visual interest or appeal. While a surge tank was important to the production of hydropower at this facility, the need to preserve the tank itself is highly questionable. The tank is physically located well away from the Childs plant where the bulk of historical information will likely be sought. The tank's design and purpose are easily depicted in photos, drawings or verbiage. Removing the tank will have no impact on historical depictions.

SHPO's record for preserving Native American sites is dismal, and it continues to ignore the requests of Native American stakeholders in this proceeding. The Yavapai-Apache,

stewards and residents of Fossil Creek long before the appearance of Euro-American settlers, have asked that the surge tank be removed. Yet SHPO continues to ignore them.

As stated by Vincent Randall, Tribal Chairman for the Yavapai-Apache Nation during the proceedings to FERC, September 21, 1999:

“Five-hundred years of stewardship on the land should serve as good cause for us to be acknowledged as real life stakeholders at the table. We believe the Nations voice should have official status along with the other participants when decisions are being made about such a traditionally significant place.”

In a letter of June 5, 2000, Vincent Randall stated:

“As we stated in the letter Chris presented on our behalf in May the Yavapai-Apache Nation was initially drawn to the process by the concept of full restoration for Fossil Creek....

“We believe the idea of full restoration is a noble one. Is the surge tank really intrinsic to the Euro-American experience in the west? ... The Yavapai-Apache Nation is pro preservation, but we see it as a matter of strict triage. Can the APS story be told without the actual surge tank? Yes, we believe it can. Will the touring public be diminished if the surge tank is removed? No, we believe it will not. Is the concept of returning the landscape to as close to the pre APS condition as possible a noble one? Yes, indeed it is. Is the skylined surge tank part of that condition? No it is not.”

Over and over, in the state of Arizona, ancient Native American sites have been photographed, at best, and then bulldozed with SHPO's blessing in the name of development. Now, the Yavapai-Apache are requesting one small concession from SHPO in this historical opportunity to restore a site that holds cultural and spiritual significance for their Nation.

We find SHPO's insistence on preserving the concrete tank, against the express wishes of the Yavapai-Apache Nation, shameful and appalling. We would hope that no admonition to the USFS concerning respect for the Nation in this matter is necessary.

The goal of the restoration plan is to return the area to its natural state as much as possible. The Introduction of the Removal and Restoration Plan reads, "The following plan is based on limiting damage to the surrounding environment while returning the environment as close as practicable to its native state." The native state did not include a three-story concrete tank. Moreover, the tank is a visual scar on the landscape and interferes with the enjoyment of a "natural" area.

The surge tank will be an obvious target for graffiti and will increase maintenance costs. With restoration, Fossil Creek will become a more desirable recreation destination, drawing larger crowds, and with potential historical signage regarding the surge tank, drawing them specifically to the tank. The USFS and SHPO should consider whether it has the funds to continuously remove graffiti and trash from the tank. Should the tank

be left in place, we will seek designation regarding who will patrol the tank area and how often the maintenance work will be performed.

The tank represents a liability The USFS and SHPO , as well as APS, should consider the safety and legal issues they may encounter given that the tank represents an "attractive nuisance". Again leaving the tank in place and perhaps including signage drawing people to the tank is irresponsible. Putting a fence around the tank will only add to the nuisance factor and certainly does not constitute "removal and restoration."

The next issue at hand is APS' request to leave the electrical, mechanical and other equipment in place in the Child powerhouse. We recognize that APS has and will continue to incur substantial costs in complying with the terms of the Agreement and with the Federal Energy Regulatory Commission's requests for information to support APS' Surrender application. We also appreciate the contention that the contents of the powerhouse may be helpful as a means of interpreting the historical production of hydroelectric power at the plants. As such, we do not intend at this time to object to leaving the majority of the contents in the Childs powerhouse.

Sincerely,

Lisa Force
Program Director

Water and Sewer Board irked by questions raised in letters and rally

Times-Independent by Lisa Church

Moab, UT - Recent protests and letters to The Times-Independent questioning the business practices and the fairness of the Grand Water and Sewer Service Agency (GWSSA) board structure prompted one board member to ask agency employees to develop charts and literature explaining how the agency is organized and operates.

Rex Tanner, a member of the agency operating committee, took issue with statements and statistics disseminated by Living Rivers - a Moab-based non-profit group that promotes water conservation and restoration of Western rivers - in news releases and at a rally two weeks ago protesting the agency's water management practices. Tanner

characterized as "outrageous" statements made by the group, and said a letter to the editor in the March 20 issue of The Times. The letter writer called the agency to task for holding "secret meetings" in reference to legally-allowed executive session discussions held by the board, clearly show that area residents do not understand the workings of the agency and the laws governing public boards.

"There's just so much misinformation floating around out there. The newspaper should not be telling people in this county what this agency is doing. The agency should be doing that," Tanner said.

But James L. Walker, a member of the Grand County Water Conservancy District Board, disagreed. Walker said groups like Living Rivers, and others in the community will choose to misinterpret the agency's actions in order to push their own agendas.

"Every time you give them more information they still interpret it however they want," Walker said. "All you do by giving them more information is to give them more ammunition to use against us."

Agency board president Gary Wilson questioned whether developing informational literature for the public is the best use of staff time. State and federal law require all public agencies to provide certain documents and information upon request by citizens, and Wilson said the agency always complies even though doing so often constitutes a drain on staff.

"It takes a tremendous amount of the staff's time to provide this information," Wilson said. "But we do it because we have to."

RRFW Riverwire PEARCE FERRY RAPID UPDATE

The normally tranquil waters of the Colorado River are beginning to become turbulent at two points near Pearce Ferry, Arizona just past the western boundary of Grand Canyon National Park. This reach of the Colorado River is controlled by the water level of Lake Mead. When the lake is near full pool, a large lake with no current greets river runners departing the end of Grand Canyon. But with the 4th year of drought continuing, the unusually low level of Lake Mead has caused the Colorado River to entrench into the sediment deposited in the upper reaches of the lake. The river is flowing with strong current at the Ferry. The river no longer follows its historic channel and is now flowing over low gravel hills approximately one mile north of Pearce Ferry. Two new riffles have formed in this area.

The upper riffle, at approximately river mile 280, is a series of small standing waves stretching almost all the way across the river, which is about 150 feet wide at this point.

A fast channel has developed on the river right side of the riffle. The lower riffle is forming where the river is cutting through a saddle between two small hills.

At this time, these riffles pose no difficulty to river travelers, but have the potential to upset articles laid out on watercraft decks. Night floating through this area is not recommended. This area has the potential to form serious rapids as Lake Mead is projected to drop 12 to 15 feet in the next 4 months.

Photographs of these two riffles are at www.vishnutemplepress.com/pearceferry.html

West's water at risk as Utah lake shrinks

By Stuart Leavenworth Sacramento Bee Staff Writer Monday, March 31, 2003

LAKE POWELL, Utah -- When John Wesley Powell embarked on his historic trip down the Colorado River in 1869, he described a raging, foaming torrent of water, rapids "that reel and roll and boil ... making a wild music."

It is doubtful Powell would recognize the Colorado River now. As it enters the lake that bears his name, the river looks more like a creek than a cataclysm. Starved by four years of drought, the nation's second-largest man-made lake has dropped to its lowest point in three decades. It is the Amazing Shrinking Reservoir, and its rapid downsizing is sending ripples across the West, even up to Northern California.

Unsure about supplies from the Colorado, Southern California is buying water from Sacramento Valley rice farmers. Las Vegas also is scrounging for supplies. Environmentalists are saying "we told you so," and Lake Powell's major industry -- houseboating -- isn't floating like it once was.

On a recent weekend, boat owners Rob and Darcy Yates drove to the upper tip of Lake Powell and stood stunned by the miles of sunbaked mud flats before them.

"The environmentalists have wanted to drain Lake Powell for years," said Darcy Yates, a flight attendant from Lehi, Utah. "It looks like they will finally get their wish."

Normally holding 7.8 trillion gallons of water and stretching 180 miles into two states, Lake Powell is dropping a foot a week, slowly exposing the sinuous canyons that federal engineers flooded when they built Glen Canyon Dam in the early 1960s.

If the dry spell continues, officials of the U.S. Bureau of Reclamation will have to prepare for the unthinkable. Eventually, they say, the lake could drop so low it will stop feeding the hydroelectric penstocks that generate \$70 million in power yearly for 1.7 million people throughout the Southwest. At that point, the water supply of 25 million people in California, Nevada and Arizona would also be in jeopardy.

"We could witness the draining of Lake Powell in our generation," said John Weisheit, conservation director of Living Rivers, an environmental group based in Moab, Utah. "When a big drought comes on the Colorado, no amount of reservoirs will help."

Even federal officials, who rarely acknowledge their projects are vulnerable to nature's whims, say the next few years could be crucial.

"It is never too early to start getting a little concerned," said Rusty Gattis, deputy manager of Glen Canyon Dam. "You never know what the next day may bring."

Seen from the air, Lake Powell looks like a giant blue Rorschach blotch splattered across the red-rock moonscape of southeastern Utah. When full, the reservoir holds enough water to cover Pennsylvania a foot deep. Now, it has dropped to half its volume, leaving behind a white ring of calcified rock on its vast, 1,960-mile shoreline.

Scientists disagree on what is happening to Lake Powell and other depleted reservoirs of the Colorado basin.

Some say the watershed is experiencing a normal boom-and-bust cycle -- illustrated by the huge snowstorm that walloped the Rockies two weeks ago. Others say the region is undergoing a climatic shift that could lead to multiyear droughts unseen during this century.

Nowhere are the stakes higher than in Page, Ariz., a town of 9,000 near the Utah border that is entirely dependent on Lake Powell. Some 2.5 million people visit Page and the Glen Canyon National Recreation Area each year, spending an estimated \$400 million on houseboat and Jet Ski rentals, motel rooms, fishing gear, boat tours and countless gallons of sunblock.

Business leaders say despite the low water, Lake Powell is still the floating party it once was.

"The press keeps putting out the message that the lake is gone, or half-empty," said Joan Nevills Stavelly, director of the Page-Lake Powell Chamber of Commerce. "We like to say that the lake is half-full."

Even so, the drought has created some challenges, as Stavelly readily acknowledges. Already, three boat ramps are unusable because of the low water. The National Park Service is spending \$2.5 million to extend the boat ramps before the tourist season starts in May.

The drought also has complicated the task of reaching popular destinations, such as Rainbow Bridge, the world's largest natural rock arch.

Four years ago, tourists could boat within eyesight of Rainbow Bridge. Now, they must dock a half-mile away and walk along a floating gangplank and trail to the sweeping, 290-foot-high arch.

Velma Stoss, an Arizona native who now lives in Seattle, returned to Rainbow Bridge two weeks ago and was taken aback as she hiked up the trail.

"When you think about the amount of water that has been lost, it is staggering," said Stoss, gazing at the dried-up side canyon beneath Rainbow Bridge. "I guess it is going to California."

Stoss is partly right. Although Lake Powell provides recreation and hydropower, its main function is to convey water from the upper Colorado basin to states downstream. Under the 1922 Colorado River Compact, the four states of the upper basin -- Utah, Colorado, Wyoming and New Mexico -- must release 8.2 million acre-feet (or 2.6 trillion gallons) from Powell each year, no matter how much flows into the lake.

About half of that goes to Southern California.

In effect, Lake Powell serves as a massive security blanket for the upper basin states, which might otherwise have to tap their own reservoirs to send water downstream. But it hasn't come without a cost.

As Lake Powell filled Glen Canyon, it drowned miles of fern-lined canyons, Anasazi Indian ruins, petroglyphs and mysterious rock arches and chambers like the Music Temple and Cathedral of the Desert. The casual loss of this natural heritage angered artists and environmentalists, some of whom cling to a hope that Glen Canyon Dam will one day be decommissioned and the canyon eventually restored.

One of these is Rich Ingebretsen, a Salt Lake City emergency room doctor and an unlikely activist. A descendent of Brigham Young, Ingebretsen spent his youth rafting down the upper Colorado River. When Lake Powell started to submerge some of his favorite rapids, Ingebretsen saw his calling in life and founded the Glen Canyon Institute, one of several groups committed to draining the lake.

Wearing a cap that reads "Damn Dam," Ingebretsen recently rented a motorboat and went in search of some of Glen Canyon's lost wonders.

Heading south from Hall's Crossing marina, Ingebretsen rounded one sheer cliff after another, then turned right into the Escalante arm of Lake Powell, then left at a side canyon. Soon the boat was entering an increasingly narrow, curved chamber, wide at the bottom with a slender parabola of sunlight descending from above.

"This is the entrance to one of the most famous places in Glen Canyon," pronounced Ingebretsen as he entered a cavern called the Cathedral in the Desert. "We are going to see something people haven't seen in years."

A favorite haunt of early canyon explorers, the Cathedral has been called a masterwork of natural architecture. During its heyday, a slim waterfall fell from the lower part of the cavern; now the cascade is submerged. The bottom walls are discolored from years of high water, but still the Cathedral is an ethereal place, a water-carved amphitheater of streaked sandstone, shifting light and reverberating echoes.

For seven years, Ingebretsen has been trying to rally people around the idea of bringing back these jewels by draining Lake Powell. Some say his quest is quixotic. Others call him crazy.

Not surprisingly, Ingebretsen isn't a popular figure in Page, a town whose founders helped build Glen Canyon dam. The town stopped welcoming environmentalists in 1981, when a group of Earth First! activists climbed onto the dam and unfurled a banner that depicted a giant crack down the side.

Water managers in California and Arizona also scoff at the idea of draining Powell.

Dennis Underwood, a former Bureau of Reclamation commissioner, says the drought would be far more serious if the reservoir wasn't there. Without Lake Powell, he said, lower basin states would be close to exhausting the Colorado's downstream reservoirs, such as Lake Mead, backed up by Hoover Dam. "You'd have trouble meeting the needs of the lower basin," said Underwood, who now works for the Metropolitan Water District of Southern California.

Even with Lake Powell, the region's water prospects are hardly secure.

According to the U.S. Census Bureau, the combined cities of Phoenix, Las Vegas and Los Angeles are adding about 350,000 people every year. Las Vegas in particular is a major water consumer, using 307 gallons per person daily -- about twice as much as residents in Los Angeles.

In recent months, Las Vegas officials have started restricting the water pumped to golf courses, raising the ire of resort owners. The city is mulling other conservation measures, although critics such as Weisheit, of the environmental group Living Rivers, say the measures are mostly window dressing.

For several years, various California agencies have been haggling over a proposed water sale between the Imperial Valley and San Diego, aimed at securing Southern California's access to surplus water from the Colorado River.

Now, however, federal officials are unsure if there will be much surplus water in coming years. As a result, the Metropolitan Water District has been lining up backup supplies, such as the water it is purchasing from Sacramento Valley rice farmers.

Even the recent storm in the Rocky Mountains -- which dumped several feet of snow -- didn't help prospects much.

As it melts, much of that snow is expected to soak into the parched soil of the region, leaving little for reservoirs, said Barry Wirth, a spokesman for the Bureau of Reclamation. Lake Powell as a whole is expected to drop for a few more weeks, level off with spring runoff, rise a few feet and then starting dropping again this fall.

Ultimately, many water analysts say, the western United States will have to confront some root causes of the water crunch in the Colorado basin. When they divided up water supplies in 1922, the basin states overestimated the average yield of the river and went on to develop cities, farms and reservoirs based on an unrealistic estimate of nature's bounty.

Now, say Reclamation officials, the upper basin is struggling to send water downstream as a historic drought collides with a historic population boom.

"Everything is really tight," said Wirth, who works out of Salt Lake City. "As every year goes by, and another moving van moves into Grand Junction and Salt Lake, it gets a little harder."

Colorado blizzard not helping drought

Kansas City Star
JUDITH KOHLER
Associated Press

DENVER - Colorado's worst blizzard in nearly a century fell on the wrong side of the Continental Divide for much of the drought-parched West.

The mountain snowpack that feeds river basins serving eastern Colorado rose to more than 100 percent of average levels after the storm. But the snowpack feeding the Colorado River basin, which provides water to seven Western states, rose only slightly.

Most states plan to keep in place voluntary or mandatory water restrictions and conservation measures, saying it is too early to tell what the summer will bring.

"There's not any meaningful change," said Wayne Cook, executive director of the Upper Colorado River Commission, based in Salt Lake City. "Maybe next time you could send (the snow) over in a truck or something, dump it over the top, let it run down this side of the hill."

A 1922 agreement allocates Colorado River water among the states. Colorado, Wyoming, Utah and New Mexico get water from the upper part of the basin and California, Nevada and Arizona get water from the lower basin.

Water agencies from Las Vegas to Santa Fe, N.M, closely track storms in the Colorado mountains, where snowpack is even more critical in drought years.

"What impacts us is snow in the Colorado Rockies," said Vince Alberta, spokesman for the Southern Nevada Water Authority, which serves Las Vegas.

The blizzard dumped up to 8 feet of snow in a 500-mile swath in Colorado and southeastern Wyoming the week of March 17, primarily falling on the east side of the Continental Divide.

In river basins serving eastern Colorado, the storm increased projected snowpack runoff from 61 percent of the historical average to 65 percent this year. That is up from the 14 percent recorded at the end of the spring melt last year.

The blizzard barely registered in the Colorado River's lower basin, where the projected runoff remained at about 62 percent, said Colleen Dwyer, spokeswoman for the U.S. Bureau of Reclamation in Boulder City, Nev.

The snowpack percentage is measured against a 30-year average. Melting snow contributes about 80 percent of the water in rivers, streams, lakes and reservoirs, which comprise much of Colorado's water supply.

The blizzard was encouraging but one good season won't wipe out four years of below-average snowpack, Alberta said. His water authority will maintain limits on outdoor watering and types of lawns and water recycling.

In Wyoming, the snow will help parched grasslands in the southeastern region where ranchers have struggled to keep their cattle fed. The rest of the state will benefit little, state climatologist Jan Curtis said.

"Having been in a drought for three to four years now, we are probably so far behind so far as moisture deficit that it would probably take seven of these types of storms to get back to normal," she said.

In the Denver area, paralyzed for days by hip-deep snow, initial glee about the storm's impact on the drought has turned into measured enthusiasm.

"How wonderful! This is really going to help us out," Peter Binney, utilities chief in the Denver suburb of Aurora, said when heavy snow started March 18. Reservoirs that feed Aurora are so low that there's a ban on new lawns and planting vegetables and new flowers.

A week later, Binney was still optimistic, but cautious. "I'd like to see a couple more of these in the next couple weeks," he said.

More snow and rain were predicted for the mountains and foothills, where spring can be the wettest time of the year. El Nino is credited with breaking the region's dry cycle this year.

Vivienne Fink still plans to tear out her Kentucky bluegrass lawn and replace it with ornamental grasses, boulders and native plants.

"I just really don't want to have to pay for watering a lawn that probably shouldn't be there in the first place," she said.

The moisture will allow farmers to delay irrigating for a couple weeks, but "it certainly doesn't end the drought crisis," said Bob Sakata, one of Colorado's largest vegetable producers.

Colorado's blizzard won't do much to relieve the drought in the West, said John Weisheit of the environmental group Living Rivers in Moab, Utah.

He said he is concerned that a wet spring will lead people to ease up on conservation. The Colorado River can't meet the area's growing demand even in good years because the water is overallocated, he said.

Wetter-than-normal seasons in the 1980s and 1990s helped mask that fact, Weisheit said.

"We've been lucky, is what we've been," he said. "Now our luck's run out."

RRFW Riverwire

RIVER PLAN DRAFT NOW SET FOR OCTOBER RELEASE

Grand Canyon National Park planners have pushed back the release of the release of the Draft Management Plan for the Colorado River Management Plan to the fall of this year. RRFW has learned that the NPS is now looking for release of the Draft River Management Plan for no later than October 31, 2003.

RRFW has also learned that the reason for the delay is to allow Grand Canyon National Park planners to include advice from a National Park Advisory Board subcommittee made up of concessioners, nonprofit groups and others. RRFW has not yet discovered how this group will be formed, however we do know that among those pushing for the formation of this Advisory Board subgroup are Grand Canyon River Outfitters Association Executive Director Mark Grisham and GCROA consultant Destry Jarvis.

Besides releasing a Preferred Alternative, Grand Canyon National Park planners expect to have 5 to 6 other alternatives in the draft. One of the alternatives will be a motor-free alternative. Park planners are still looking to have a Final CRMP by December 31, 2004, so that river concessions contracts can be renewed in 2005. All 16 of the river concession contracts will terminate if not renewed on December 31, 2005.

River News 04/07/03

RRFW RIVERWIRE - CONCESSIONAIRES HIRE DC LOBBYIST

T. Destry Jarvis has recently been hired to lobby for the Grand Canyon River Outfitters Association, a trade association established to protect the economic interests of 16 Grand Canyon river concessionaires. Mr. Jarvis will be influencing the CRMP to benefit his employers, especially in Washington D.C., where he lives. Mr. Jarvis recently noted that powerboats on the Colorado River in Grand Canyon are "necessary for the future good condition of the park and the provision of high quality visitor river experience there." He also stated in a recent article for the Boatman's Quarterly Review (Spring, 2003), that "...all concerned should come to realize that the river experience is enhanced, and the park's resources are better conserved, with motors, while both the experience and the resource are diminished without."

Jarvis' position is that the exceptions to the Wilderness Act that have allowed motors shape the real application of it more than the Act's actual language. This is relevant since his various interpretations of the Wilderness Act appear to hinge on where his paycheck comes from. While employed as Federal Policy Director at National Parks Conservation Association, Jarvis wrote a letter defending the 1980 CRMP's proposed phase-out of motors in Grand Canyon National Park to NPS Director Russell E. Dickenson.

"...the decisions to ban motors in the Grand Canyon...were not made lightly, but only after years of discussion, study and consideration." he admonishes the Director. Mr. Jarvis went on to say, "The Service can not afford to allow additional years of contentious debate on these issues, if progress is to be made in any other of the many problem areas deserving your attention. NPCA urges you to stand firm on these important principles."

"What changed his mind? There have been no amendments to the Wilderness Act, no changes in the underlying spirit, values and principles of Wilderness. The intent of Zahniser and wilderness advocates and contemporaries Olaus Murie, Aldo Leopold, Supreme Court Justice William O. Douglas and Bob Marshall is clear. Time and again they wrote that motorized transportation is antithetical to Wilderness." notes Jo Johnson, co-director of River Runners for Wilderness.

Johnson went on to observe "If Jarvis is so sure powerboats are fine in Wilderness, why is it necessary for him to lobby legislators for a Grand Canyon Wilderness Bill that leaves its heart--the Colorado River--out? Why not just allow Congress to designate the entire Grand Canyon, with the River, Wilderness? Is it possible he isn't convinced and therefore must hedge his, or rather, GCROA's, bets?"

"Now more than ever, we need the peace and solace of motor free Wildernesses in Grand Canyon and elsewhere. The meaning of Wilderness was clear in 1964, it was clear at the time of Mr. Jarvis' 1980 impassioned plea to get rid of motors, and it remains clear now. If there is any place on Earth that deserves to be free of motors, it has to be Grand Canyon." Johnson remarked.

Regional News 04/10/03

Trying to make sense of current water controversy (part one)

Times-Independent

Moab, UT

by Lisa Church

contributing writer

Ask a dozen people in Grand County to explain how the Grand Water and Sewer Service Agency works, and you're likely to get a dozen different answers. Factor in the three individual water districts that have pooled their resources under the GWSSA umbrella and the confusion deepens to bewilderment.

In the West, where control of water wields considerable power, it is not surprising, then, that this complex organizational structure devised to manage and distribute culinary and irrigation water in Spanish Valley and throughout Grand County has become a lightning rod for critics who contend that too much water in the valley is now controlled by governing bodies representing the interests of too few county residents. Conversely, staunch defenders of the system maintain that the agency serves the interests of the public by protecting and preserving the valley's valuable water resources.

This great divide in public thinking is deeply rooted in the history of modern water development in Grand County and the chain of events that led to the creation of GWSSA in 1998.

First there was a dam: Creation of the Grand County Water Conservancy District

In the early 1970s, most water rights in Grand County were still privately owned, or were vested in the Moab Irrigation Company, a private corporation made up of individuals who elected to convert their water rights into shares of stock in the larger company. Because growth in any modern community is intrinsically tied to that community's ability to provide its residents with adequate water and sewer services, Grand County officials during this time recognized the need to begin developing a stable water system within the valley.

Their solution: form a water conservancy district that could acquire water rights, build infrastructure including a dam, storage and delivery system, and offer water services to farmers, ranchers and residents in Spanish Valley.

Under state law, water conservancy districts are formed by district courts, and are considered state, not county, agencies. The governor appoints the district's five board members, although the county may recommend names for appointment. However, state law requires a petition, signed by at least 20 percent of landholders within the district, be presented to the court requesting the court to create the conservancy district.

Like all state water conservancy districts, the Grand County Water Conservancy District, created by the 7th District Court in 1971, has the right to hold water rights, and to provide irrigation and culinary water service to customers within the service district. GCWCD's district includes all of Grand County, and 370 adjacent acres in the San Juan County portion of Spanish Valley.

When GCWCD was formed, the district immediately began work to develop the Mill Creek Project – a water storage system that includes constructing a dam to divert water from Mill Creek into a reservoir at Ken's Lake, and the lake's delivery system that now provides irrigation water to shareholders within the district.

To accomplish this massive project, the district needed financing. The State of Utah's Division of Water Resources agreed to provide a low-interest loan to pay for the project, but in order to receive financing, the GCWCD first had to acquire water rights, which

they purchased from the Moab Irrigation Company, to be held by the state as partial collateral for the loan.

The district's initial 1979 agreement with the state estimated the cost of the Mill Creek Project at about \$3.7 million, but construction delays, and the county's economic downturn in the early 1980s –largely a result of the demise of the uranium business – forced the district to seek an additional \$900,000 in funding over a period of several years.

To recoup part of the cost, the district elected to sell irrigation shares to valley farmers and ranchers. Today, about 125 individuals and corporations purchase irrigation water shares in Ken's Lake water, and the annual proceeds from the sale of those shares helps cover the annual loan payment to the state.

The district initially believed it could also generated revenue through the sale of industrial water to mining and other business entities. But as the mining industry went bust, those hopes dried up, said James Walker, president of the Moab Irrigation Company, and a current member of the GCWCD board.

Unfortunately, the water shares owned by GCWCD were strictly irrigation water, so in 1979, the district entered into an exchange agreement with local farmer George White that provided the district with a minimum of 625 acre feet of culinary quality water from White's numerous wells, in exchange for an equal amount of irrigation water from Ken's Lake. The district set about constructing a storage system and pipes to transport the water from White's wells to a storage tank that would eventually provide culinary water to Spanish Valley residents.

Delivering Culinary Water and Sewer Services: The creation of Spanish Valley Water and Sewer Improvement District

Because state law prohibits water conservancy districts from operating a sanitary sewer system, the county commission, in 1974, created the Spanish Valley Water and Sewer Improvement District. The district's boundaries were tightly drawn to encompass only Spanish Valley, and then, only that portion of the valley located within Grand County.

SVWSID is charged with the responsibility of building and operating a culinary water distribution system, storm drainage, and a sewer collection system to service Spanish Valley residents.

The district's five-member board, appointed by the Grand County Council, consists of individuals residing within the district's boundaries.

Since its formation, SVWSID has systematically built infrastructure to deliver culinary water, and sanitary sewer services to Spanish Valley, including the recent \$5.4 million expansion project that extended those services to outlying areas of the valley and created additional culinary water storage tanks that will hold water generated from new wells recently approved for partial development by the state.

Under the original agreement, SVWSID purchased culinary water at wholesale prices from GCWCD, then provided the water at retail cost to customers. Rather than incur the expense of building and maintaining a sewer treatment plant, SVWSID contracts with the city of Moab for sewer treatment, and recoups the cost through user fees.

Currently, SVWSID revenues pay a portion of three separate bonds incurred to cover costs of water delivery systems and development of culinary water and sewer services.

Financing: Creating the Grand County Special Service Water District

Developing water services and storage facilities is an expensive business. In Grand County, financing the host of projects dating to the original Mill Creek Project was a challenge that, like many other Utah counties, commissioners resolved by proposing creation of a special service water district. The Grand County Special Service Water District, approved by Grand County voters in 1977, possesses specific powers to raise funds through taxes and bonds – powers not bestowed upon GCWCD and SVWSID. The GCSSWD may also raise funds through various federal and state granting agencies.

The creation of GCSSWD enabled Grand County to acquire additional funding – through taxes and bonds – needed for the construction of the Mill Creek Project, as well as monies required for building a culinary water and sewer delivery system in Spanish Valley. The agency is an independent district but is governed by Grand County, which appoints the district's five board members.

Primarily a financing agency, GWSSA works in tandem with the Grand County Water Conservancy District, and with Spanish Valley Water and Sewer Improvement District, to secure funding and make payment on outstanding loans and bonds for Grand County water and sewer projects, said Grand County water planning administrator, Lance Christie.

Combining Resources: Creation of the Grand Water and Sewer Service Agency

As all three water-related agencies worked to develop their joint and individual projects, the issue of managing Grand County's water systems surfaced as a significant problem. From the beginning, the boards of GCWCD and GCSSWD met jointly and shared the same chairman and vice-chairman. The two districts were bound by an agreement, signed in 1979, that gave GCSSWD authority to act as the conservancy district's agent for construction of the Mill Creek Project, and making payments on the project loans.

In 1980, SVWSID and GCWCD agreed to share staff and office space. The conservancy district hired staff, and SVWSID paid a percentage of staff salaries and benefits through reimbursements to GCWCD. These districts were also bound through an agreement by which GCWCD leased culinary water and storage to SVWSID, which then distributed the water to Spanish Valley customers.

These confusing arrangements were, perhaps, not ideal, but as Christie points out, they were likely necessary.

"This complicated mess of agencies was required because of the limitations and powers in the Utah State Code which are extended to Water Conservancy Districts, Special Service Districts, and Water and Sewer Improvement Districts," Christie has said. "It may be a mess, but it's the best mess we could come up with."

In an effort to simplify matters, the three districts agreed in 1998 to create one management agency that would oversee the daily operations and ongoing financial management of Grand County's water projects.

The Grand Water and Sewer Service Agency has, perhaps, become the most contentious part of the county water puzzle. Many find the agency's organization difficult to understand, and some question whether it gives each individual district equal representation at the table.

But the agency's structure is fairly simple. The GWSSA board consists of all members of each of the individual district boards, and board members have equal voting power. However, the agency also has a seven-member operating committee, charged with overseeing the agency's day-to-day business. That committee, consisting of three members each from the boards of the GCWCD and SVWSID, and one member from the GCSSWD board, has no power to set budgets, and may not conduct elections, but the committee is empowered to approve agency expenditures up to \$10,000. The operating committee appears to hold no clear power over the agency's full board because any member of the agency's full board may vote on issues brought before the operating committee.

GWSSA manager Dale Pierson is empowered through the interlocal agreement signed by all three districts, to "perform and carry out the functions, activities, and responsibilities of improvement districts," and to act as the financial agent, disbursing debt payments and collecting annual revenues for the individual districts. Under the agreement, the individual districts retain ownership of all property, and resources, and they also remain responsible for any outstanding district debts.

Is GWSSA Here to Stay?

Those who support the GWSSA structure say it saves all the districts money by streamlining staff and operations, and has improved communications between districts that sometimes in the past appeared to be working at cross purposes.

But critics charge that GWSSA staff, originally hired by GCWCD, rarely has the interests of SVWSID users at heart. To illustrate, SVWSID board member Barb Morra points to the fact that the titles to culinary water rights purchased through the agency are always held by the conservancy district. Spanish Valley Improvement District, she said, has never been offered the chance to own water rights even though it has the largest and only culinary water customer base.

Resolving these issues may be the greatest challenge confronting GWSSA staff, and the boards of Grand County's individual water districts. In the next several weeks, the

Times-Independent will examine in-depth the inner-workings of GWSSA, and water issues facing Grand County's water districts.

Editor's Note: This is the first detailed installment of a series, a heavily researched series on how things operate in Spanish Valley's complex water and sewer agencies. The situation is critical to the future of Grand County, and needs to be understood. Though controversial, we believe it is essential.

Regional News 04/17/03

Umbrella agency may be causing confusion, conflict (part two)

Times-Independent
Moab, UT
by Lisa Church
contributing writer

When Grand County's three water districts agreed in 1998 to create an umbrella agency to oversee operations and management of culinary and irrigation water systems the plan was touted as a cost-saving measure for all water users in Spanish Valley.

Today, some Spanish Valley water users believe the arrangement has created an unwieldy financial structure that forces culinary water users to unfairly subsidize about 125 irrigation water users.

The plan to combine the districts seemed logical at the time, past board members have said. The three districts – Spanish Valley Water and Sewer Improvement District (SVWSID), Grand County Water Conservancy District (GCWCD), and Grand County Special Service Water District (GCSSWD) – already shared staff and office space, and the culinary and irrigation systems were dependent on one another because the Conservancy District, which built the Mill Creek Project and Ken's Lake Reservoir, owned the culinary water rights, storage tank and tank delivery systems and sold culinary water to the Improvement District, which provided drinking water to Spanish Valley customers but did not own substantial culinary water rights or storage facilities. The Conservancy District paid staff, then billed the Improvement District for the time staff logged working on Improvement District projects.

By creating the agency, many argued, districts had little to lose and everything to gain. Districts would still own all their property and resources, but revenues, except those from property taxes, would be billed by and paid directly to the Grand Water and Sewer Service Agency (GWSSA), and the agency, in turn, would issue payments for outstanding revenue bonds and other ongoing agency expenses. GWSSA staff would continue to oversee the daily operations of the culinary water and sewer system, and the Ken's Lake irrigation system, but could focus all their attention on work rather than spending valuable time tracking daily hours by project so the Improvement District could be billed separately.

"Some days I felt like I was spending more time writing down what I was doing that I actually spent doing the work," GWSSA manager Dale Pierson said. "Now, we can focus completely on our jobs."

Improvement District board member Barb Morra is not convinced.

"We don't know how their time is spent now. The Improvement District contributes four times the revenue of the Conservancy District, but are we getting four times the work? I don't know. And [agency staff] has no documentation," Morra said.

Pierson said the staff "probably spends that much more time" doing work for the Improvement District because maintaining culinary water and sanitary sewer systems is far more costly, both in time and money, than maintaining the Conservancy's irrigation system. In addition, he said, the Improvement District has grown, and the agency employs a staff member whose time is largely spent handling monthly billing for water and sewer service customers.

"The Improvement District is our primary focus," Pierson said. "There's health and human welfare involved there. If we have two jobs to do, and one is irrigation and the other is drinking water or sewer, the drinking water or sewer job takes top priority. It's that simple."

For critics, on-site staff accountability is but one of several problems with the agency arrangement. Morra says. In 2002, the Improvement District contributed more than \$1 million in revenues to the agency, compared to \$362,000 contributed by the Conservancy District. The agency budget shows that Improvement District Costs totaled \$910,000 – a gross profit of about \$100,000 – while the Conservancy District had \$360,000 in expenses.

"The whole thing about the agency is every time you try to figure out something fiscal, it's like trying to hit a moving target," Morra said. "We're contributing 90 percent to the agency while the other districts are contributing 10 percent. Where is our money going? I'd like to know specifically."

Spanish Valley resident Bill Love believes he knows. The agency, he charges, is using Improvement District revenues to "subsidize" the 125 irrigators who annually purchase Ken's Lake water.

In a detailed written statement to the Times-Independent, Love argues that the agency regularly uses Improvement District revenues to pay for work and maintenance of the irrigation water system and Ken's Lake Reservoir.

Love rightly points out that state-backed loans for the Mill Creek Project which created Ken's Lake are annually paid through property taxes charged to all Grand County taxpayers. That bond was approved by taxpayers in 1980, and will be completely paid in 2018. Love argues that through those property taxes, all Grand County residents are "subsidizing" the irrigation water users of Ken's Lake.

And it is true that the lake would likely not exist without the tax revenues. But Pierson points out that voters approved the bond, in part, because Ken's Lake is also a recreation area that is open to the public.

"A lot of people use Ken's Lake every year. A lot of people here see it as an amenity," Pierson said. "The lake isn't just for irrigators."

Love also believes recent water fees from Spanish Valley customers are being used by the agency to pay Conservancy District expenses.

"The fees from the culinary users and irrigation users are co-mingled to pay expenses of \$490,477 for the operations and maintenance of the irrigation system, the culinary water system, and debts. GWSSA claims that they are unable to identify which fee is used to pay which bill without extensive analysis," Love wrote.

And he charges that the water rate structure of Spanish Valley – a conservation-oriented structure that charges increased fees for higher water consumption – are unfair, compared to the rate structure for irrigation customers whose fees per acre-foot of water decrease with higher consumption. Irrigators pay between \$21 and about \$35 per acre foot, depending on use, Pierson said.

"The culinary water users are now completely unprotected from GWSSA using their fees to subsidize the 125 irrigation Ken Lake and the golf course," Love said.

Pierson said the rate structure for irrigation users is "typical" for Utah.

"There are a very few number of irrigation customers who actually try to make a living from farming," Pierson said. "We don't want the water to be so expensive we put them out of business."

Lance Christie, the water planning administrator for Grand County, said it is not uncommon in the West for drinking water customers to subsidize irrigators. But in many parts of the state, he said, the culinary water users pay much higher fees.

"It's a common practice. But from my research, the people in Spanish Valley are subsidizing at a much lower rate than in most other places," Christie said.

A 2001 report by the state's Division of Drinking Water backs up Christie's claim. According to that report, culinary water agencies in Utah charge, on average, \$1.39 per 1,000 gallons of water. In Spanish Valley, customers pay between \$.50 and \$1.25 per 1,000 gallons depending on how much water they use. The state report shows that the average Utah home customer pays \$33.89 per month for drinking water. Bills in Spanish Valley average about \$24 per month, GWSSA staff said. Sewer charges are billed separately.

For critics of GWSSA, the monthly cost of water is less important than whether the agency is properly managing the financial resources of the Spanish Valley Improvement District. Agency staff now view revenues from all districts – except tax revenues, which are kept in separate accounts – as agency revenues, not separate revenues from

individual districts. And supporters of the agency say the arrangement works to the advantage of all districts because all three are interconnected through the complex network of culinary and irrigation water supply lines and storage facilities.

"It may not be perfect, but things work a lot better now," said Conservancy District board member James L. Walker. "The idea here is for all the districts to work together. We all have the best interests of Grand County at heart."

Pierson puts it another way. "One district wouldn't exist without the other," he said. "It's that simple." Morra believes otherwise.

"I think the Improvement District would be better off as a separate district," Morra said. "The agency isn't doing us any favors."

Next week, this Times-Independent series will examine arguments for and against an agency plan to purchase wells and property that they currently lease, and which district should own the water rights if the purchase is completed.

How district got culinary water rights (part three)

Moab Times Independent by Lisa Church contributing writer

From their inception in the 1970s, Grand County's two main water districts have struggled with a serious dilemma – both had authority to provide culinary water to Spanish Valley, but neither district owned any culinary water rights.

Because the state had placed a moratorium on further water exploration in the valley more than a decade before, the county could only secure culinary water by purchasing or leasing existing water rights. In 1979, the Grand Water Conservancy District solved this massive problem by striking a deal with local rancher George White. In exchange for a maximum of 625 acre feet of irrigation water from Ken's Lake, White agreed to provide the district with an equal amount of culinary water from his wells.

That 50-year agreement between White and the Conservancy District enabled the district to provide wholesale culinary water to the Spanish Valley Water and Sewer Improvement District, which delivered the water at retail prices to customers in Spanish Valley. For some, the pact also marks the beginning of a water monopoly in the valley.

In recent years, district and county officials have mulled, with increasing concern, the county's prospects for securing culinary water rights beyond 2029 when the exchange agreement with White is set to expire. So when a pair of those wells came up for sale, board members of the Grand Water and Sewer Service Agency – an umbrella agency created by the districts in 1998 to oversee daily management of Grand County water projects – jumped at the chance to own them outright.

With the board's near unanimous blessing – two members opposed the purchase – GWSSA in February began efforts to secure a purchase agreement with White, and the financing needed to seal the deal. The sales price will remain undisclosed until final negotiations are completed, but Dale Pierson, GWSSA manager, has said the agency hopes to recoup much of the cost by selling land – about 130 acres – that is also included in the deal.

The plan approved by board members gives the agency staff authority to pursue the purchase, and places ownership of the White water rights and land in the hands of the Grand Water Conservancy District. That decision, some charge, gives the Conservancy District a monopoly on valley water, and forces Spanish Valley water users to remain forever dependent on the Conservancy District for its culinary water supply.

"There's no reason the [Spanish Valley Improvement] district should not own that water," said SVWSID board member Barb Morra. "If we purchase the water, we can become independent of the Conservancy District. But they don't want that to happen. Basically, we're allowing the Ken's Lake water users to control the agency, and that means they control where the water is going and how much Spanish Valley users pay."

For Spanish Valley resident Bill Love, the plan represents a "boondoggle" that gives the Conservancy District total control over Spanish Valley water users. Love said the agency should hold a public hearing before making a final decision about the purchase.

"This water is for the use of the culinary rate payers in Spanish Valley. The negotiations are controlled by the irrigators' board members," Love said in a letter to the Times-Independent. "The irrigators, per a June 6, 1979 agreement, can charge the culinary rate payers any fee they 'fixed from time to time' for the culinary water. If the new culinary water is given to the irrigators, they will have the ability to charge the culinary users any fee they decide is sufficient to pay all their expenses."

Morra points to the fact that agency board chairman, Gary Wilson, is “one of the largest users of irrigation water in the district,” as evidence that the members of the Conservancy District control the GWSSA board.

Wilson and other board members take issue with Morra’s characterization.

“To me, the whole purpose of this agency is for us all to work together,” Rex Tanner said at a recent meeting. Tanner, a Grand County Council member and a GCWCD board member, dismissed Morra’s allegations as “paranoia.”

“It’s not us against them here. It’s one pool that we’re working from,” Tanner said. “We started down this road to purchase this water because of the long-term goal to better serve the community. This seems like a good business deal to me, and I hope we go through with it.”

During several board meetings, Morra and Love have also repeatedly questioned why the Improvement District has not been given the option to purchase the White wells. Pierson said the decision is purely financial – banks view the Conservancy District as a “better risk” than the Improvement District because GCWCD has fewer outstanding debts.

Currently, SVWSID makes annual payments on eight outstanding revenue bonds totaling almost \$5 million– most associated with a recent system expansion – and one general obligation bond, paid through property taxes collected from Spanish Valley residents, totaling \$126,000 that will be paid off in 2006. The revenue bonds have payoff dates ranging from 2006 to 2040, depending on the specific bond, Pierson said.

The Conservancy District has one outstanding bond, Pierson said. That bond, a \$1.5 million general obligation bond paid through annual property taxes assessed all county property owners, will be paid off in 2018, he said.

“Either district could purchase the White property and wells. But from what our attorneys and the bank tell me, the Conservancy District is in a better position to borrow the funds,” Pierson said. “Banks want to be at or near the top as lien holders. In the case of the Improvement District, that just isn’t possible because they already have several outstanding revenue bonds.”

But Morra said that simply is not true.

“I’ve had conversations with the bank, and they’ve said we can buy the property,” she said. “I just don’t see what the problem is here.”

Pierson said bank representatives “prefer” making the loan to the Conservancy District for reasons stated earlier.

“The Improvement District may be able to secure financing, but it would be much more difficult, if it’s even possible,” Pierson said.

Some agency board members fear that the ongoing debate will derail the White purchase, leaving Grand County vulnerable in future years should the Whites sell the wells to someone else.

“Barb has some good points to make, but I think we need to move on this,” said James Walker, Conservancy District board member. “No one has ulterior motives with this purchase. But proven wells like this don’t come along often. We need to buy them while we can.”

The agency has yet to finalize a contract for the White well purchase, but Pierson said an agreement is “close.” So far, the board has not responded to Love’s call for a public hearing on the issue.

Next week, in the final installment of this series, the Times-Independent will explore the effectiveness of the GWSSA agreement, and examine arguments for and against dissolving the agency.

Letter to LR 05/02/03

Response from BuRec: Glen Canyon Dam's Adaptive Management

United States Department of the Interior
Bureau of Reclamation
Washington, D.C. 20240
In Reply Refer To: ADM - 2.00

Ms. Lisa Force
Program Director
Living Rivers
P.O. Box 1589
Scottsdale, AZ 85252

[Letter to Gabaldon \(January, 2002\)](#)

<http://www.livingrivers2.org/archives/article.cfm?NewsID=234>

Dear Ms. Force:

Thank you for your participation as a member of the public in meetings of the Glen Canyon Dam Adaptive Management Work Group (AMWG). The AMWG was formed as a Federal Advisory Committee to make recommendations to the Secretary of the Interior on the operation of Glen Canyon Dam and the use of other management authorities to achieve the resource protection objectives of the Grand Canyon Protection Act and the Glen Canyon Dam Environmental Impact Statement (GCDEIS) Record of Decision (ROD). You have raised concern for many of the important resources downstream of Glen Canyon Dam, and have encouraged the AMWG to take action to protect these resources. We have integrated your specific comments into the areas of endangered

species protection, sediment conservation, administrative activities, and public outreach.

Endangered Species

Protection of endangered species is one of the paramount mandates of all Federal agencies, and the AMWG strategic plan is framed from that perspective. Many recent discussions within the Adaptive Management Program (AMP) have addressed the apparent decline in juvenile recruitment and adult population estimates of the humpback chub. The cause of this decline is unknown, but may be related to non-native competition and predation, parasitic infestation, habitat conditions, or adverse effects from handling and sampling. It is the current opinion of the Grand Canyon Monitoring and Research Center (GCMRC) that negative effects from non-native fish predation and competition overshadow other factors.

Collecting and addressing this type of new information and hypotheses is one of the strengths of adaptive management. At its January 2002 meeting, the AMWG passed the following motion calling for the control of non-native fish:

"In support of goal 2 (of the Strategic Plan), the AMWG recommends the following actions subject to environmental compliance to include assessing recreational use, Endangered Species Act (ESA), in consultation with the tribes and other affected state agencies.

- 1 . evaluate methods to remove non-native fish, except rainbow trout, from Bright Angel Creek in 2002,
2. evaluate methods to remove non-native fish from the LCR in 2002,
3. gather public input and conduct public education and environmental compliance on long-term removals in #1 and 2 above,
4. establish a Technical Work Group (TWG) ad hoc committee to develop a 2002 - 2006 research monitoring and management work plan for meeting MO 2.5 and 2.6 of the August 17, 2001, Draft of the AMP Strategic Plan. The TWG will report back to the AMWG at the next meeting,
5. using data from #1 - 4 above to make recommendations on future removal."

Through a combination of National Park Service and Bureau of Reclamation funding, appropriate environmental compliance, and approval by the Secretary of the Interior, these nonnative fish control efforts began this year. The authority and responsibility for these non-native control actions rest with appropriate Federal and State agencies, the National Park Service for the Glen Canyon National Recreation Area and Grand Canyon National Park and the Arizona Game and Fish Department for the State of Arizona. Results from initial evaluations will guide future decisions about management actions and dam operations.

Testing experimental dam releases to benefit the humpback chub is also an important part of the Biological Opinion (BO) on the Operation of the GCDEIS. The BO discusses implementing these test releases in low release years of approximately 8.23 million acre-feet (maf). Reclamation has agreed to implement such experiments through the AMP. Several years ago, GCMRC coordinated the preparation of a program of experimental flows to address this requirement. The resultant work product called for the establishment of baseline conditions, followed by a steady release with moderately high spring flows and low flows the remainder of the year. In fiscal year 2000, we tested these steady spring and summer flows, even though the annual water year release was greater than 8.23 maf. In water years 2001 and 2002, the dam made releases according to the GCDEIS ROD, and baseline data was collected. This baseline data will be compared with data from future experiments, the nature of which is still evolving among native fish experts through the AMP.

As described in more detail below, GCMRC followed this initial experimental design with a 2003-2004 experiment designed to benefit humpback chub and conserve sediment inputs. In all these adaptive management actions, the U.S. Fish and Wildlife Service (Service) has actively participated, and Reclamation has continually discussed with the Service the resulting effects to ensure that sufficient progress is being made toward removing jeopardy from the humpback chub and achieving the recently published U.S. Fish and Wildlife Service Recovery Goals for the humpback chub.

Sediment Conservation

The 1996 Beach Habitat Building Flow (BHBF) was highly successful in depositing sand above the normal maximum discharge stage. Subsequent wind and water erosion of these deposits was expected, as was the need for periodic redeposition of sediment. Since that time, additional research has indicated that the previous assumption of interannual sediment conservation of tributary sediment inputs is likely incorrect, indicating a relatively short residence time for the finer fractions of tributary inputs. As a result, the AMWG passed the following motion at the January meeting relating to further testing of BHBFs:

"In concert with Reasonable Prudent Alternative flows for native fish, during 2002-2003 request that the GCMRC, in consultation with the TWG, design an experimental flow sequence that tests hypotheses for conservation of sediment. Report to AMWG in April 2002 on the proposed flow sequence."

In response to this motion, GCMRC proposed an integrated experiment in February 2002, addressing specific assumptions and hypotheses for the humpback chub and sediment conservation. To counter the short residence time of fall tributary sediment inputs, this experiment tests two strategies to preserve these inputs until high flow tests can be conducted the following January. The fall flows of these tests are hypothesized to benefit the humpback chub and would complement the results of the 2000 Low Steady Summer Flow experiment. Nonnative fish control efforts during 2003-2004 are also expected to reduce the deaths of humpback chub from predation and competition. This experiment is now underway. In addition, GCMRC and the AMWG are now working

to develop an overall program of experimentation that addresses the ecosystem as a whole, including all the resources considered by the AMP.

Administrative Actions

During the past 2 years, the AMP has succeeded in developing a strategic plan, the completion of which has represented a significant increase in the ability of stakeholders to work together on common goals. We recognize that some reject the concepts of collaboration and consensus, but we believe that these approaches will produce more effective resource protection results than litigation and conflict. In addition to completing the strategic plan, the AMP has sequenced the strategic plan research information needs, which will guide future scientific work.

Reclamation and the GCMRC have restructured their websites to facilitate public access of AMP documents such as the GCMRC State of the Natural and Cultural Resources in the Colorado River Ecosystem report and the annual report to Congress required by the Grand Canyon Protection Act. These reports include results from the monitoring and research activities conducted as part of the AMP. The AMWG meeting minutes also contain scientific presentations at technical and management meetings on the status of resources.

Public Outreach

Public involvement is a key part of the AMP. Stakeholder membership on the AMWG was carefully selected to provide representation of public interests. It is important to note that any AMWG recommendation to the Secretary of the Interior is implemented only after completing appropriate National Environmental Policy Act (NEPA) compliance with applicable federal law (e.g., NEPA), a step that ensures additional public participation. In addition to inviting the public to AMP meetings, we have attempted to keep all information about the program visible and accessible. We recognize that to date, few outside public comments have been given at our meetings, and that the AMWG's response to your comments has been less than you desired. In future meetings, we will encourage AMWG members to continue their discussion after public comments are received to ensure understanding, prior to voting on recommendations. It would also likely be more effective for public comments to be received prior to any meeting to allow AMWG members time to consider comments. Since most of the issues addressed during the AMWG meetings are first discussed by technical and ad hoc groups, we would encourage you to become involved in the technical presentations and discussions which form the basis for AMWG recommendations.

In conclusion, we believe the AMP is a successful example of a collaborative, multi-stakeholder process. Moreover, we believe that this critical program is fulfilling the role envisioned by the Grand Canyon Protection Act, the 1996 Glen Canyon Dam EIS, and the Federal Advisory Committee Act. The Department of the Interior is taking action to address resource concerns revealed by scientific monitoring and have enlisted prominent scientific advisors and other forms of peer review to enhance the quality of analysis in this process. We appreciate your comments and welcome your continued involvement in all our meetings.

Sincerely,

Michael R. Gabaldon

Lake Powell's 'new marina' another Park Service fumble

May 17, 2003 12:00 AM

Arizona Republic

Letter to the Editor

The May 5 article "New marina at Lake Powell 30 years in making" omitted two significant facts:

- Low reservoir levels make the marina unusable.
- The Diné will receive only low-level jobs, while profits go to non-Diné developers.

The Diné Medicinemens Association, along with Living Rivers and others, asked for a proper environmental impact statement. The concerns were disavowed by the National Park Service, which determined that this \$75 million project on virgin Diné land would have "no significant impact" on the human or natural environment.

The Diné leaders asked the Park Service to consider dedicating this spiritually significant site as a place for their people to be educated in the traditional ways of their cultural heritage. This alternative deserves a respectful response by the National Park Service.

The Park Service wants to provide economic opportunities for the Diné, yet it refused to study Living Rivers' proposal to allow the Diné to become the concessionaire at Wahweap Marina. Living Rivers also stressed that building another marina when visitation has been declining does indeed impact humans and the environment.

Antelope Point is perched on top of a canyon wall. To operate this facility the reservoir must be nearly full. Currently the reservoir is down 95 feet and the public boat ramp ends at the cliff's edge. Current high demands for an already over-allocated Colorado River, compounded by a present and future drought cycles, makes Antelope Point a boondoggle.

How can a facility that must face the hardships of natural topography and drought during a period of decreased visitation be considered without a study? The Park Service should be delighted to provide taxpayers with a thoughtful process, especially if it will demonstrate true benefit to the Diné.

LR Press Release 06/05/03

Secretary Gale Norton's 2025 Water Plan--propaganda to mask reality

Colorado River water users should prepare for the worst

Contact: Owen Lammers (435) 259-1063

On Friday, June 6, Denver will play host to Interior Secretary Gale Norton and one of the greatest public relations charades in the history of western river management. At a time when many Western states are experiencing major problems with water allocation, the Department of Interior is selling the public "band-aids for gun-shot wounds," says the Colorado River advocacy group Living Rivers.

Secretary Norton's initiative "Water 2025 Plan: Preventing Crisis and Conflict in the West," is little more than a repackaging of management strategies Interior is already implementing combined with a heightened push for desalinization technology. It contains no proposals for how to substantively address major water shortages, such as those looming in the Colorado River watershed.

"Minor efficiency gains and conservation measures as Secretary Norton prescribes will bring about some savings, but these are merely drops in the bucket given that the Colorado River is providing barely half the water the Department of Interior is contracted to deliver," says Owen Lammers, Executive Director of Living Rivers.

Abundant historical evidence reveals that the present drought in the Colorado watershed is far from unprecedented, and warnings from the United States Geological Survey one year ago urged water managers to be prepared for several decades of below average precipitation. Lammers notes, "Water 2025 demonstrates that the Department of Interior is ignoring this responsibility."

- The Plan emphasizes Interior's long-standing tradition of acquiescing to the states for resolving disputes. However, as eighty years of conflict reveals, cooperation is rare, even in the best of

times. Moreover, as California recently demonstrated, reaching agreement amongst Colorado River water users within states is problematic. This internal dispute forced federal action in January to reduce Colorado River flows into California.

- The Plan's market-driven water banks and transfers from farmers to municipalities during times of shortages are laudable on a small scale, but there is no discussion of what will happen when the real crisis hits. Certainly, the 25 million people reliant on Colorado River water will not be deprived, but what will it cost? Farmers are becoming increasingly reluctant to make water transfers, as San Diego has recently experienced. Without strict federal guidelines and policies, municipalities like Los Angeles, Phoenix, Los Vegas and Salt Lake City will be forced into a cost environment not unlike what California energy utilities faced three years ago.
- Crop substitutions, which represent the greatest opportunities for water savings are completely ignored by the Plan. Nearly half of Colorado River water is used to grow water-intensive alfalfa and other forms of cattle feed. Much of this water could be saved by growing crops for human consumption.
- The Plan relegates environmental stewardship as merely aspects of conflict, not as an integral part of what society now demands of its river managers. Despite the fact that all the water referred to in the Plan comes from rivers integral to this continent's natural heritage, the Plan does not even mention or use the word river, other than when using place names. In describing its "Five Realities" the Plan completely ignores the reality that the riverine ecology throughout the watershed, such as in Grand Canyon National Park, Dinosaur National Monument and the Colorado River delta, has been dramatically altered, while the public is becoming increasingly vocal about reversing the damage.
- The Plan advocates maintaining and enhancing existing infrastructure. However, much of this infrastructure is responsible for the loss of up to 20 percent of the Colorado River's flow due to evaporation and seepage amongst its reservoirs. The draining of Lake Powell reservoir, for example, will eliminate enough water loss to service the municipal water needs of the state of Arizona.
- Not until the 25-page report's last 100 words does the term "drought" receive much attention. This should be Interior's main focus at this time. Questions Interior needs to be asking include: outlining specific federal management tactics it may employ; how farmers will be enticed or forced to release their water to preserve municipal economies, and will Interior enforce strict conservation strategies and efficiency standards?

"This report is all about carrots with no federal stick," adds Lammers. "Interior must begin developing water use standards and practices, as well as allocation strategies to

be implemented as this drought situation worsens. Absent this, crisis is inevitable, despite Secretary Norton's report and marketing strategy titled to prevent it."

A River, Saved: Wild Yampa and Green nearly went the way of Glen Canyon

A River, Saved: Wild Yampa and Green nearly went the way of Glen Canyon
By Judy Fahys The Salt Lake Tribune
THE YAMPA RIVER, Colo. -- This wild place might have been entirely different were it not for a fateful boat trip a half-century ago. Fifty years ago this month, David Brower fell in love with the Yampa, and the Green and the Colorado rivers downstream. In the years that followed, a time before the word "environmentalist" existed, the activist rallied the nation against two dams planned for canyons just below the Yampa, dams that would have forever changed the landscape into vast lakes. This history was unknown to Salt Lake City resident Bob Hausser when he signed up for a white-water rafting adventure this month. In fact, the retired Kennecott engineer wore his "Lake Powell" T-shirt as Brower's one-time aides talked about the significance of Brower's fight for wild rivers and urged listeners to follow the example of his spirit.

Hausser's trip leader was John Weisheit, who sipped all day from a plastic coffee mug that proclaims, "Just Drain It!" referring, of course, to the same Lake Powell beloved by Hausser. Weisheit is director of the Moab-based environmental

group Living Rivers, which through its Colorado Riverkeeper project organized the 50-year anniversary raft trip.

"We have things to do," Weisheit said at the outset. "We're going to get going again."

"Going," in this case, means reviving the broad-based conservation ethic that made it possible for activists such as Brower to help shape the modern West.

Brower, who died in 2000, took his trip in the U.S. Bureau of Reclamation's heyday, when it had more than 140 dams on its project list. And, after he drifted through Dinosaur National Monument's scenic redrock canyons, he made a career of harnessing American outrage over the destruction of national treasures for water and electricity intended to profit the bureau alone.

Two of the proposed dams would have braced against canyon walls visited on this month's Riverkeeper trip.

The bureau proposed one for below Echo Park, at the confluence of the Yampa and the Green. The other would have been more than 20 miles below at Split Mountain on the Green. If they had been built, the dams would have inundated 140 miles of canyon, up to Flaming Gorge on the Green and to Deerlodge Park on the Yampa.

"What happened here 50 years ago changed the world," said Rod Nash, the noted wilderness historian who joined the Brower commemorative trip in his dory, Canyon Dancer.

Brower fought dams with statistics that showed they would not conserve as much water, nor provide as much power, as the Bureau of Reclamation projected. When the bureau had finished building its Colorado River Basin dams, the two Dinosaur dams were not among them. "We have a living river here -- the Yampa is undammed," Nash told the 20 commemorative trip clients in one after-dinner talk. "It's a miracle in the American West." The guide: What might have been lost can be seen by anyone floating the rivers with Dee Holiday. He has been guiding for about 42 years, much of it with his wife, Sue, co-owner of their Holiday Expeditions, which hosted the commemorative trip.

Tall and wiry, Holiday probably knows the Yampa as well as a human can after spending roughly 2,000 days of his life on it.

He is the naturalist who can point out a chokecherry forest on the trail and tell about a woman named Josie whose chokecherry wine was the county's best. He is the oarsman who can pull a fast-moving raft away from the dangerous waves and dips of a rapid.

He is the historian who knows the story behind Pat Lynch, the hermit whose initials are chipped into canyon and cave walls. He can point out an unusual wild, desert orchid, rare spawning grounds for endangered fish and secret sea fossils captured in canyon stone.

Holiday is also the hiking guide who asks visitors to be respectful inside a cavern that holds ancient American Indian ruins.

"It's a real special place to me," he says, nearly whispering. "But it's sacred to the Native Americans."

The song and feel of rivers has always gripped Holiday, and its hold has only tightened with time.

"When you are younger, you do rivers for the experience," he said. "The longer you do it -- that's when I started to love the river." Slack water: To the activists, loving Western rivers means, in many cases, trying to undo the damage wrought by mankind. Where dam advocates point to the electricity Colorado Basin dams provide to 9 million people and the water they deliver to 30 million people, the activists see environmental havoc.

Wherever dams have been constructed, the surrounding ecology has fundamentally changed, usually harming the plants and animals around it. A good example is Glen Canyon, which was filled with water behind a dam built just outside the boundaries of Grand Canyon National Park, a dam Brower didn't fight but always wished he had.

Its riverbed spawning grounds for endangered fish species have been ruined by the dam flow's unnatural currents. And the trophy trout planted in the cold water below the dam are blamed for making meals of the federally protected humpback chub, flannelmouth sucker and the bluehead sucker.

More recently, the Bureau of Reclamation's renewed efforts to desalt the lower Colorado River have environmentalists worried about the fate of species-rich wetlands near the river's end, in Mexico and California.

Meanwhile, a near-war continues between the Grand Canyon's commercial rafting outfitters, who insist on using motorized boats to speed clients downriver, and wilderness advocates who say the Colorado, by law, should be motor-free in the park.

Weisheit's group has spearheaded the 4-year-old campaign to remove Glen Canyon Dam, which forms Lake Powell. Living Rivers charges that, besides imperiling or wiping out seven fish species, weak canyon walls and pressure from silt buildup will someday make the dam fail.

While dam supporters have laughed at the idea, Weisheit remains confident the dam will be removed and Lake Powell will be drained. "We can do it, and we can do it soon."

Kim Crumbo, a retired Grand Canyon river ranger and wilderness advocate, takes a starker, more ominous view.

"The victories are ephemeral," he says. "The defeats are forever." To dam or not to dam: Heady as the debates and history lessons might have been for the 20 paying customers on this trip, it was the wild Yampa that swayed their hearts.

Ranging in age from 7 to 70-something, they came from Portland, Ore., and Scottsdale, Ariz., and the nation's capital to run the Yampa and sections of the Green.

They saw how, because there is no dam, the Yampa's water is brown with silt and carries a forest of tree-size snags on its boisterous current. They observed migrating

pelicans and browsing deer. They might have seen small rabbits, snakes or the fossil remains of prehistoric life.

Still, they didn't always agree with the activist-leaders.

For instance, Denise Dion, a Maryland-based regulatory consultant and rafting enthusiast, agrees that motors should be restricted in the Grand Canyon, but not banned, because motorized rafts make the place much more accessible to the public.

"I want to go to pristine areas," she said. "But my aunt, she wants to see them, too. She's 70," and cannot get around easily without the help of paved paths and motorized conveyances.

Dion called the push for a motor ban "elitist."

"You have to think about how you can serve many masters," she said.

A retired political science professor on the trip commented: "For most people, wilderness is not having a flush toilet and a motel."

Hausser, meanwhile, has not lost any affection for his Lake Powell houseboat, although he did gain a new appreciation for conserving water and efforts to block future dams. He says activists are "unrealistic" about decommissioning Glen Canyon Dam.

"I love the idealism of the people on the trip," he said, "but they are not going to be able to take back what is done." "Don't give up": Some activists are optimistic that this, the latest effort to engage the public in the debate in the fight for the West's rivers, will succeed. Others have doubts.

Lisa Force, a project director for Living Rivers, predicts that the movement will not gain broad public support until society has a crisis, perhaps a fit of guilt over its wasteful use of the Colorado River and the ecological damage that is being left for future generations.

"The hope is we'll recognize humans are part of the Earth community," said Force, who serves on the Sierra Club's board of national directors.

Jeff Ingram, another speaker on the trip, reminded the group that Americans deeply value the places they have set aside in parks, wilderness and preserves such as the wild Yampa. Ingram is a mathematician and Grand Canyon advocate who has been described by Cadillac Desert author Marc Riesner as Brower's secret weapon in the fight against dams proposed for the Grand Canyon.

Recalling Brower's seemingly futile efforts to protect wild, Western rivers, he pressed listeners to hold fast to their ideals, think independently and pursue those ideals even in the face of what seems like hopeless odds.

Parks, wilderness and wild places are something that all Americans cherish, he said.

"You may get defeated, but don't give up."

Water: BuRec to alter flows at Utah's Flaming Gorge Dam to protect endangered fish

April Reese

Land Letter Colorado correspondent

The Bureau of Reclamation is putting the finishing touches on a proposal to change the way it operates Flaming Gorge Dam on the Green River in Utah to help recover endangered fish downstream, agency officials say. While federal biologists say the new flow regime will go a long way to meet recovery goals, some environmentalists contend that decommissioning the dam is the only way to help the fish over the long run.

The forthcoming draft environmental impact statement, over three years in the making, will likely call for releasing more water from the dam in the spring, said Beverly Heffernan, environmental protection specialist in the BuRec's Provo, Utah office. Providing peak spring flows will bring sediment downstream, where it forms sandbars and replenishes beaches -- important nursery habitat for endangered fish.

"The proposed action is to change the way we operate the dam so it more closely resembles a natural river flow," Heffernan said.

The draft EIS, initially scheduled to be released this spring, is now expected to be issued in October. The delay is necessary to give the agency a chance to incorporate new water temperature data into the document, Heffernan said.

The dam, authorized by Congress as part of the Colorado River Storage project in 1956 and completed in 1964, was primarily built to create a 91-mile-long reservoir that would store water promised to users in the Upper Colorado River Basin as part of the Colorado River Compact. The dam -- the largest on the Green River, a major tributary of the Colorado -- also provides hydropower: The Flaming Gorge power plant's net generation in 2002 was about 217 million kilowatt hours (kWh).

But in the 1980s, federal wildlife biologists began to suspect that the dam was harming native fish downstream in Dinosaur National Monument. In 1992, FWS issued a biological opinion that found the dam was contributing to the decline of four species of endangered fish in the Green River: the razorback sucker, Colorado pikeminnow, humpback chub and bonytail.

That prompted BuRec, which operates the dam, to study how changing the operation of the dam might help the fish. The resulting flow recommendations, completed in 2000, provided the basis for the new proposal, Heffernan said.

Under the new plan, BuRec would allow as much as 11,900 cubic feet per second (cfs) of water to flow over the dam in the spring. Currently, flows below the dam fluctuate between 830 cfs and 4,000 cfs, peaking in summer and winter, when electricity demand

is greatest. But operating the dam to simulate natural flows will not have a significant effect on power generation, Heffernan said.

Larry Crist, a fisheries biologist with FWS who helped develop the 2000 flow recommendations in his previous position with BuRec, said that while altering the operation of the dam is "a big step forward," it's only part of the solution. "It's an important element, but it's not the only element in recovering these fish," he said. "You'll have to do that in conjunction with dealing with non-native species and reintroducing native fish in places where they're no longer found."

The Moab, Utah-based environmental group Living Rivers says altering flows is not enough to recover the fish. It has urged BuRec to consider decommissioning the dam, and hoped the agency would include dismantling as an alternative in the draft EIS. But Heffernan said taking out the dam is not an option. "We can protect fish while maintaining other functions of the dam," she said.

John Weisheit, conservation director for the group Living Rivers, is skeptical.

"It's not going to work, in my opinion," he said. "They're applying band-aids to stay out of court, to show they're trying to keep the fish alive. But as long as that dam is there, affecting temperature and sediment, recovery of those fish is not going to happen."

Crist acknowledged that a natural system would be "the most ideal situation," but he said the new flow regime is "a good compromise" considering the realities of demands for power, irrigation and recreation.

"When you deal with the Endangered Species Act and you deal with recovery, it doesn't mean returning all the way to natural conditions," he said. "I think endangered fish can tolerate a certain amount of development."

And with snowmelt still below average in some watersheds, Lake Flaming Gorge provides an important source of water for a growing population, Heffernan said.

"The current drought we're in shows the value of these reservoirs, for both water storage and endangered species. It provides a source of water for everybody in a period where there wouldn't be water otherwise," she said.

"Unless we can get everybody to not move to the state of Utah, (the dam) will continue to figure in our water needs substantially."

Complicating recovery efforts is the presence of an economically important blue-ribbon trout fishery below the dam. While the endangered razorback sucker, Colorado pikeminnow, humpback chub and bonytail require warm water, trout need cool water.

Crist said the new flow regime will create temperatures agreeable to both endangered fish and trout. But Weisheit sees that scenario as overly optimistic. "You can't manage for both endangered native fish and exotic fish in the same system," he said.

Letter to LR 06/17/03

Commissioner Keys responds to LR letter

United States Department of the Interior
Bureau of Reclamation
Washington, D. C. 20240
In Reply Refer To:
W-6333 June 17, 2003
ADM-13.00

Mr. Owen T. Lammers
Executive Director, Living Waters [Rivers]
P.O. Box 466
Moab, Utah 84532

Dear Mr. Lammers:

Thank you for your [letter to Secretary of the Interior Gale A. Norton dated March 14, 2003](#), regarding Colorado River issues. The Secretary has asked that I respond to you on her behalf. Similar to other Western rivers, the Colorado River Basin has experienced four dry years, some of which having been among the driest on record. With such a significant part of the nation dependent on water supplies from the Colorado River, it is truly fortunate that we continue to enjoy the benefits of our existing water supply facilities that help to mitigate to make up for these tough years of insufficient moisture.

As you point out in your letter, these issues are complex and sometimes contentious, and it gives me a perfect opportunity to mention the Secretary's new initiative, entitled Water 2025: Preventing Crises and Conflict in the West. Water 2025 recognizes the realities we face in dealing with water issues, such as explosive population growth, increasing needs for water for environmental and recreational uses, and the national importance of food and fiber production from Western irrigated agriculture. Water 2025 sets forth a strategic plan to facilitate a vigorous and educated public discussion in key Western communities, including those that rely on the Colorado River, where the likelihood for conflict and crises over water exists or can be predicted to occur by the year 2025. I invite you to attend and participate in any of the eight regional consulting sessions hosted by the Bureau of Reclamation. The information on these sessions is located on our website, www.doi.gov/water2025.

Again, thank you for your comments and concerns about Colorado River issues. The Colorado River has been and will continue to be a top priority for our agency, and I look forward to working with you and your organization in the constructive and positive manner set forth in Water 2025.

Sincerely,

John W. Keys, III
Commissioner

LR in the News 06/30/03

Colorado River basin unprepared for shrinking reservoir capacity

April Reese, Land Letter Colorado correspondent

PAONIA, Colo. -- The intricate plumbing system that has turned the arid Colorado River basin into a patchwork of irrigated fields and fast-growing cities is at risk of running dry if water managers do not focus more effort on keeping sediment from building up behind the river's dams, some water experts and river advocates warn.

The Colorado River stretches 1,450 miles from the Rocky Mountains to the Gulf of California and the Sea of Cortez, draining a 244,000-square mile basin. More than 30 million people in seven states depend on water stored in the basin's reservoirs to provide a steady and reliable supply for irrigation, hydropower and municipal water use. But while the dams allow large volumes of water to be stored and distributed, they also intercept sediment that would otherwise be carried downstream in the silt-heavy river. Sediment is slowing accumulating in the system's reservoirs, and eventually will render their usefulness for water storage obsolete, water experts say.

"If we allow those reservoirs to fill up with sediment, we'll have severe water shortages, and we will not be able to meet our water needs," said Ron Christensen, an independent water engineer based in Salt Lake City.

Scientists say siltation is affecting areas downstream as well: Reservoirs are collecting sediment that in a natural river system would flow downstream and replenish sandbars and riverbanks, resulting in erosion and a deepening of the river channel.

Barry Wirth, who handles communications for the Bureau of Reclamation's Upper Colorado River Basin office, said sedimentation "will present some challenges," but not until "many years down the road."

Wirth said it will take centuries for silt to have a major impact on water storage capacity in the basin's reservoirs. As an example, he cited Lake Powell, the reservoir created by Glen Canyon Dam in Arizona and one of the Colorado's largest. It will not silt up for another 500 to 700 years, he said, adding that that estimate is based "somewhat on conjecture."

But some water experts say that is an overly optimistic scenario that fails to take into account the vagaries of weather, climate change, water demand and other variables.

Christensen said capacity can shrink dramatically long before silt reaches the top of a dam.

For instance, "Lake Powell has gone from full to half empty," because of the current drought, he said. "If the reservoir was half full with sediment [when the drought hit], you'd be done today, basically. All the water you'd have is what's coming down the river

- there would be nothing in storage." Glen Canyon Dam and Lake Powell. Photo courtesy of BuRec.

John Weisheit, conservation director for the Moab, Utah-based group Living Rivers, said that BuRec's wait-and-see approach could backfire.

"It puts the entire system in jeopardy, and it's going to be embarrassing for them," he said. "They're in denial. They knew this was going to happen when the dams were built."

All of the dams -- including the massive Hoover Dam, built in the 1930s -- were constructed with extra storage capacity to account for sedimentation buildup, said Bob Walsh, Wirth's counterpart in BuRec's Lower Colorado River Basin office. Dam engineers estimated how much sediment was likely to build up behind the dam and expanded the reservoir's depth accordingly, Walsh said. For example, of Lake Mead's 32 million acre-feet capacity, 2.5 million acre-feet were set aside for sediment. (One acre-foot is the amount of water needed to cover an acre of land in one foot of water.)

"Some of the organizations that would like to see the dams removed would like to tell people the dams are going to silt up and be useless. But we've never seen anything that provides hard evidence of that," Walsh said. "The engineers that planned and built these dams knew the Colorado was a silty river and they took special precautions for that. These dams were built to handle sedimentation."

It's too soon to come up with solutions to a problem that isn't likely to surface for centuries, Walsh said. And when that day comes, "there will be ways to remove the sediment, if that's necessary," he said.

Wirth added that with the water supply for 30 million people -- and counting -- hanging in the balance, BuRec would not hesitate to address the sediment problem if the agency felt it was a pressing concern.

"It's to our advantage to do as thorough a job as we can, because it's in our best interest," he said. "We want to ensure the water is there to be allocated."

In the meantime, BuRec faces more immediate challenges, such as meeting the water needs of the current generation, Wirth said. "I just don't think in the year 2003, we can make an allocation decision for the people who will be here in 500 years. But we can do that for people who will be here in 2030," Wirth said. "Those dams were built according to what society wanted in those years. Now that we have 30 million people in the basin, how do we best utilize those resources?"

But as far back as the early 20th Century, before the dams were built, federal officials were expressing concern about sedimentation. In 1910, F. H. Newell of the Geological Survey, who later became the first Director of the Reclamation Service (now BuRec) wrote: "The upper ends of all reservoirs are rapidly filled with silt and it becomes an important question to the projectors of storage works as to how many years will elapse before the value of the reservoir is practically destroyed and whether its use can be restored in part by subsequent removal of some of this material."

Wirth said that as far as he knows, none of the reservoirs in the basin have plans for handling sediment buildup.

"I think that there are ways to wash the sediment out or stop it before it gets into the reservoirs. But no one's doing anything about it," Christensen said. "I think they ought to do it sooner rather than later because we need the water storage that we're losing to sediment," Christensen said. "We ought to be maintaining our storage capacity rather than letting it fill up."

As Colorado River-dependent cities like Tuscon, Salt Lake City and San Diego continue to grow, and demands on limited water supplies increase, maintaining full storage capacity in the system's reservoirs is becoming more crucial.

"Everybody's worried about how to get more water. Not nearly as many are worried about their reservoirs filling up with sediment," Christensen added. "And they're not going to worry about it until it becomes a problem."

Although BuRec and environmental groups have completed a handful of sedimentation studies of reservoirs in the basin, many are outdated or flawed, and "very little research is being done," Christensen said.

Water experts say the little research that has been done suggests that sediment is expensive to remove or control and difficult to dispose of.

But Weisheit said taking on the problem now, while it's still in the early stages, is preferable to waiting until diversion pipes are clogged with silt.

"A sediment survey for the whole Colorado River basin is an appropriate thing to ask for and accomplish," he said. "The longer they wait, the greater the amount of sediment they will have to deal with and the more it will cost to mitigate."

Water: Growing demand, dwindling supply

Shaun McKinnon The Arizona Republic Jul. 6, 2003

Lesson No. 1 about water in the West: There's never enough to go around, and no one's making any more.

Competition for what there is has intensified as growth and drought tighten the supply. The struggle threatens everything from economic development and tourism to agriculture and municipal water supplies.

Courts are deciding who can use the water and who can't. Cities are preparing to buy or lease from farmers or Indian tribes for 10 times the current cost.

If you go Phoenix will host the first of eight regional meetings to discuss issues raised by "Water 2025," Interior Secretary Gale Norton's blueprint for reventing water crises and conflict.

The half-day conference will be held from 1 to 5 p.m. Tuesday at the downtown Hyatt Regency Hotel.

Two sessions are scheduled, one to talk about specific Arizona issues and the other focusing on resolving conflicts. Participants include Herb Guenther, director of the state Department of Water Resources; Sid Wilson, general manager of the Central Arizona Project; Douglas Nelson of the Arizona Rural Water Association; and representatives from Indian tribes, environmental groups and local governments.

Additional sessions are scheduled throughout the summer in Las Vegas; Sacramento; Salt Lake City; Boise, Idaho; Billings, Mont.; Albuquerque and Austin.

Input from the sessions could help shape Water 2025 as well as other Interior Department water policies.

The Phoenix sessions are open to the public, but advance registration is required. Information is available by logging on to www.doi.gov/water2025/az/main.cfm.

And on the eve of a series of meetings aimed at quelling some of the unrest, the federal government lobbed its own bomb, ruling on Thursday that farmers in California's Imperial Valley are wasting water and will receive less beginning next year. Furious farmers are already preparing a legal challenge that will likely drag on for months and could eventually draw in Arizona and other states.

The escalating battles pushed Interior Secretary Gale Norton to step in and try to negotiate a truce. She introduced "Water 2025" in May as blueprint for preventing crisis and conflict and planned to begin discussing it with regional water leaders beginning Tuesday in Phoenix.

"When water crises and conflict pit neighbor against neighbor, species against species and business against recreation, when they threaten your way of life, we cannot afford to stand on the sideline," Norton said last month from Denver. "The consequences . . . are just too severe."

Critics have already dismissed Norton's plan as, among other things, "Band-Aids for gunshot wounds," as the environmental group Living Rivers called it. State and local water managers bemoan its puny budget, fearing more unfunded federal mandates. But some water experts believe it's a reasonable approach to a nearly unreasonable situation.

"The water supply is finite, and the demands are growing," said University of Arizona law Professor Robert Glennon, an authority on Western water issues. "There will be no new Central Arizona Project, no second era of dam building. That's just not going to happen. What the West is looking at is the fastest-growing section of the country, a population boom that's going on unabated. The question is, What's going to give?"

Among the issues that fuel the fiercest fights:

*Growth. More than 25 million people rely on the Colorado River, which is now controlled by dams and reservoirs for much of its 1,400-mile length. Nevada has exhausted its legal allocation of the river and is now searching for alternatives. Colorado lawmakers recently approved a plan to build a new pipeline that will carry more of that state's share of the river to its most populous cities east of the Rockies.

Related links

- * Saving Southwestern willow flycatcher
- * Special report: A long, dry streak

The story is similar on other rivers, which strain to serve growing populations. "Almost every major river in the West is overappropriated," said John Keyes, commissioner of the Bureau of Reclamation, the agency that operates most of the region's water delivery systems. In Arizona, the groundwater supply is at greater risk of depletion, especially in rural areas.

*Environment. Courts are increasingly siding with environmental groups who want water set aside for wildlife and natural habitat. Salt River Project must spend \$20 million to create and maintain a habitat for the Southwestern willow flycatcher, an endangered bird that moved into the drought-stricken edges of Roosevelt Lake. Another court ordered the Army to reduce its pumping near Sierra Vista, ruling that growth there was endangering the San Pedro River.

Just last month, a New Mexico court ruled that Albuquerque must take less water from the Rio Grande to accommodate the endangered silvery minnow. That decision is "huge," said Lisa Force, Arizona program director for Living Rivers. "It has the potential of impacting Western water law."

* Politics. Few issues have fueled the kind of political battles that water has in the West. And it has rarely been more evident than the past year in California, where the powerful Imperial Irrigation District has dug in to protect its huge water supply from San Diego, Los Angeles and the U.S. government.

Federal officials said Thursday that the district is wasting some of its allocation and will lose up to 9 percent of its water next year. Imperial holds the rights to more water than any single user on the river, more than the entire states of Nevada, Wyoming and New Mexico.

In Arizona, tribal water claims are crawling through Congress, the Legislature and the courts. The Navajo Nation earlier this year filed suit to force action on its claim to the Colorado and Little Colorado rivers, a move that could set off new skirmishes over who must give up water to satisfy any settlement.

If the tribes decide to lease water back to urban providers, they could demand premium costs. Valley cities that now pay roughly \$30 to \$100 per acre-foot could find bills topping \$1,000 per acre-foot, according to water experts. (An acre-foot equals 325,851 gallons.)

* Agriculture. Despite the urban growth explosion, farmers still use more water than anyone else in the West. The Imperial Irrigation District in southern California holds the largest single allocation on the Colorado River, larger even than all of Arizona's. That gives farmers power, but in many cases, it also gives cities a source of water for new growth. The battles will focus on how farmers will reduce their consumption and how much cities will have to pay them to do so.

* Drought and climate. The one pressure point out of anyone's direct control, drought has reshaped many of the arguments in recent years simply by reducing the amount of water available. Both the Colorado River and the Salt and Gila rivers in Arizona produced record-low runoff last year, forcing cities to draw heavily on reservoirs. Lake Powell is now at half-capacity, and Lake Mead dropped low enough to trigger limits on some states.

Drought cycle

University of Arizona hydrologist Julio Betancourt predicts the Southwest is headed into a long-term drought cycle that would choke the water supply for years or even decades. But that may be just the beginning, according to Tim Barnett, a researcher at Scripps Institution of Oceanography who is studying abrupt climate change.

Warming seasonal temperatures will shorten the snow-melting season in the West's high country and will reduce runoff by 17 percent to one-third on the Colorado River and other systems, leaving them unable to meet demands for the foreseeable future, Barnett asserts.

Those pressure points form much of the foundation for Norton's Water 2025 initiative, which begins with what she calls "the five realities:" growth, existing water shortages, conflicts caused by those shortages, aging water delivery and treatment systems, and ineffective crisis management.

From there, she proposes four tools to help stave off future crisis and conflict: improving water management through conservation, efficiency and water markets, such as Arizona's water bank; collaboration among cities, farmers, environmental groups and others who have a stake in the West's water; boosting supplies with technology such as desalinization of water that otherwise would be wasted; and adjusting policy and even law to more efficiently use existing supplies.

The proposal included an \$11 million appropriation for the first year, an amount reclamation chief Keyes acknowledges would barely address issues in Phoenix but still "money to get things started." The Interior Department will encourage state and local leaders to develop ideas and plans suitable for their specific situations.

Water experts say the plan falls short of addressing some of the most critical conflicts still looming. One potentially blockbuster showdown is brewing just over the border in Mexico, where environmental groups in that country and this one are trying to force their governments to restore the Colorado River Delta. That once lush riparian area most years now receives no water from the overtaxed river.

Restoring it would cost tens of millions of dollars and billions of gallons of water, which someone would have to give up at such a significant cost that few U.S. leaders will even consider it. Some delta advocates have tried instead to focus on minor successes that could lead to a long-term approach.

One such example is a tiny edge of the delta just south of Yuma, where runoff from farms has created a new riparian habitat that supports birds and other wildlife.

"The big lesson is that it is possible on very small water budgets to finally incorporate wildlife and the river itself into the way we manage the river," said Charles Bergman, whose book *Red Delta* chronicles the transformation.

The one hitch: The water that runs into the marshes is the same water that some officials want to treat and desalt, making more efficient use of it.

The only way around such conflicts is to settle feuds, set aside differences and cooperate, said Patricia Mulroy, general manager of the Southern Nevada Water Authority.

'This is all political'

"The consequences of not cooperating are very real and very immediate," Mulroy said. "If this drought continues, there is no way, given the current separatist approach of the lower basin states, that we can all make it through. This is all political. The hydrology of the river has made those politics more acute."

She said Arizona's willingness to bank water for Nevada is one sign that politics aren't forever. Norton actually cited the water bank in her initiative as an example of what should happen throughout the West.

"Long-lasting solutions will come from the people who must live with or learn to live without the water they need," Norton said.

"Doing nothing is an option, but only if we are willing to accept the drastic consequences that follow."

Thirsty Colorado Is Proposing to Stick a 'Big Straw' Into Its Namesake River

July 12, 2003 LA Times Headlines

By Bettina Boxall, Times Staff Writer

GRAND JUNCTION, Colo. - It's an audacious - some say absurd - scheme: Take Colorado River water just before it slips over the Utah border, pump it east more than

200 miles, lift it 5,000 feet over the Rocky Mountains and deliver it to the state's burgeoning Front Range communities.

Nicknamed the "Big Straw," it is a big, old-fashioned kind of idea, reminiscent of the mega-water projects that greened the West in the 20th century. Estimates of its cost start at \$2.5 billion and climb. Opponents call it a giant boondoggle in the making that would suck water from some of Utah's most popular rafting spots and deplete flows needed by endangered fish.

The Big Straw's grand scope underscores Colorado's keen desire to protect its full share of the 1,400-mile-long river that cleaves the Southwest like a rusty saw. Downstream in California, the plan is seen as a harbinger of the future, when the rising demands of other states along the Colorado will inevitably staunch the bounteous surplus on which the Golden State has long depended.

The water hog of the Colorado, California has no choice but to stand by while other states move to tap their full entitlements meted out by Congress and a multi-state compact in the 1920s and '40s. "They have a right to develop their apportionment," said Dennis Underwood, vice president of the giant Metropolitan Water District of Southern California.

California's prodigious thirst looms large in Western water policy and is helping drive the Big Straw proposal. Politicians see it as a way to keep Colorado water in Colorado - and out of the swimming pools and sprinkler systems of Southern California.

"While Coloradans are carefully considering which day they are allowed to turn their home sprinklers on, California lawns are lush and green, thanks to Colorado's water," Gov. Bill Owens lamented during a water policy discussion this spring.

The Big Straw proposal is still in the earliest stages of review. A \$500,000 study, due out in the fall, will determine only if the project is worth pursuing, not whether it will be built.

Nobody can say at this point how much electrical power it would take to transport the water, how much the project would cost, who would pay for it, what the route of the pipeline would be, or how much treatment the water would require. Nor can anyone say precisely who would use the water, which is coveted more for the Front Range's future growth than current consumption.

But Grand Junction water attorney and Big Straw backer Gregory Hoskin believes there is a ready market, even if the water proves expensive.

"This is the desert. People can't stand the desert. They need trees. They need green," insisted Hoskin, a member of the Colorado Water Conservation Board. "I don't know what people will pay for water. But I know people with money will pay anything to water their lawn."

Were it not for a mismatch of geography, Coloradans would probably already be using their full share of the river. But the Colorado, like most of the state's water, is on the

western side of the Rockies, while most of its people - and growth - are on the eastern side in a stretch of development that runs from Colorado Springs to Denver and beyond.

Starting in the 1930s, the state and the federal Bureau of Reclamation developed a complex system of reservoirs, aqueducts and mountain tunnels to ship water to the eastern side of the Continental Divide. The Big Straw would reach farther, pulling water through a 10-foot-wide pipe all the way from Colorado's westernmost border. The pipeline would climb 4,000 to 5,600 feet over the Rockies, higher than California's most grandiose projects. Although the State Water Project in California sends water a greater distance - 600 miles south to Los Angeles from the Sacramento-San Joaquin Delta - its rise across the Tehachapi Mountains is no more than 2,000 feet.

By waiting to tap the river after western Colorado has used what it wants, the Big Straw would avoid many messy in-state water brawls. But removing at least several hundred thousand acre-feet of water annually - an acre-foot would supply two Southern California households for a year - could change the nature of the river in the downstream states.

There would be much less flow for the river's four endangered fish species, for the huge reservoirs that store water for the Lower Basin, and for the rafting outfitters who play a significant role in Utah's recreation economy.

"We think it's horrible. It could put the river-running industry at risk," warned John Weisheit, conservation director of Living Rivers in Moab, Utah, and a member of several river outfitter boards. "It is going to be a huge burden to the taxpayer, when the more reasonable alternative is conservation."

The proposal has its critics in Colorado as well. "I don't think average, everyday Coloradans want to pay through the nose for a project like this," said state Sen. Terry Phillips, a Democrat from the Denver suburb of Louisville who scoffed at the Big Straw as an extravagant fantasy when the Legislature appropriated funding for the preliminary study. "It's ridiculous."

At the Colorado Canyons National Conservation Area, manager Greg Gnesios fears the pipeline's massive infrastructure could blight the scenic red rock canyons of the 123,000-acre tract bordering the river at the state's western edge.

"It's almost like putting it through the national park," Gnesios said. "That could create some problems for the Big Straw folks."

Dan Luecke, a hydrologist who works for several Colorado environmental groups, doubts that the scheme will survive close scrutiny.

"I think an evenhanded study will drive a stake in its heart," he said. "It's a bad idea. It will be enormously expensive. It will require an enormous amount of energy to pump that water. It will have incredible water quality problems."

Born amid the 13,000-foot peaks of Rocky Mountain National Park, the Colorado is far from pristine when it hits the Utah border. Often it resembles a giant, murky irrigation ditch.

On its course down the western slope of the Rockies, the river picks up salts and selenium from the riverbed and farm runoff, as well as urban effluent. The river's salinity levels at the Utah border are 10 times greater than they are at its headwaters. Selenium levels at times exceed state standards. If pumped untreated to high-country reservoirs on its way to the Front Range, the border water would be warmer and dirtier than the supplies into which it is piped, lowering overall water quality.

"From our standpoint, that is the biggest concern," David Nickum, executive director of the Colorado Council of Trout Unlimited, said as he stood near a mountain reservoir that flows into a trout-fishing river. "If you envision taking a large amount of water out of the Colorado and bringing it up here, it's hard to imagine the magnitude of the change [in quality] or the magnitude of treatment."

Using more water in the Colorado's Upper Basin also means that less water would reach the Lower Basin, where California has been sucking more than its share from the river for nearly half a century.

It could do so because the other six Western states that draw from the Colorado didn't need their full allocations. But as the West grows, that is changing. Arizona and Nevada have both begun to use their full river entitlements in the last three years.

"Now the reason there are surpluses is because the Upper Basin states have not developed their allocations," observed Jerry Zimmerman, executive director of the Colorado River Board of California. "In the future, there will not be surpluses nearly as frequently."

Nor is there as much water in the Colorado as everybody thought when the river's flow was divvied up between the Upper and Lower basins in a 1922 interstate compact.

Hydrologists had figured that 18 million acre-feet of water a year spilled down the river's rock-walled canyons to the Gulf of Mexico. But that estimate, based on a wet period, turned out to be too high by about 3 million acre-feet a year. The average river flow is in fact less than the total legally allotted to the seven basin states and Mexico.

"If you have a river overcommitted, then the chances of getting shortages are there. That's why you need to look at more effective ways of doing things," said the MWD's Underwood.

Ironically, the Big Straw idea grew out of love of another river. Ralph Clark III, a private environmental planner, first proposed it in the late 1980s as a way of protecting the headwaters of the Gunnison River in western Colorado. Better, he thought, to take water from the Colorado at the state border than divert the upper reaches of his beloved Gunnison to the east side of the Rockies.

But even Clark is not yet prepared to endorse its construction. He thinks of the Big Straw, which he more mundanely calls the Colorado Aqueduct Return Project, as a last resort. * Times staff writer Doug Smith contributed to this report.

Reclamation chief won't drain Powell

Arizona Daily Sun

By PAUL FOY

Associated Press Writer

SALT LAKE CITY -- Advocates of draining Lake Powell and allowing the Colorado River to flow freely through southern Utah again pitched their idea Wednesday to the head of the Bureau of Reclamation, but he dismissed it out of hand, declaring: "That's never going to happen."

Reclamation Commissioner John Keys convened the fourth of eight regional conferences on Western water problems Wednesday in Salt Lake City.

Speaking to about 350 government and water district officials, Keys advocated conservation, collaboration and planning. He told officials they shouldn't look to the federal government for money as a solution.

"I didn't come here with a bag of money to solve everyone's water problems," Keys said.

Advocates of draining Lake Powell argued that four years of drought have left the huge reservoir on the Utah-Arizona border only about half full.

John Weisheit, director of the Moab group Living Rivers, said Lake Powell could be sucked dry in eight years if the drought continues. Keys disputed that, saying Lake Powell never would run dry. And he said it would be irresponsible to drain Lake Powell or Lake Mead, the two largest Colorado River reservoirs.

Weisheit said the reservoirs squander huge quantities of water to evaporation and seepage -- a loss Keys dismissed as the "cost of doing business."

Without Lake Powell or Lake Mead, Keys said, the 23 million people who depend on the lower Colorado River basin would have had only 40 percent of their normal water supplies last year.

"It's something that's never going to happen," he said in an interview of the idea of tearing out Glen Canyon Dam. "I won't spend a dollar studying it."

LR Press Release 07/22/03

House votes to destroy Colorado River Delta wetlands

Taxpayer money to be wasted on mothballed desalting plant; Senate yet to act

Contacts:

Owen Lammers, Living Rivers, POB 466 * Moab, UT 84532 * 435-259-1063/fax 259-7612

Lisa Force, Living Rivers, POB 1589 * Scottsdale, AZ 85252 * 303-237-2269/fax 480-990-2662

Kara Gillion, Defenders of Wildlife * 824 Gold SW, Albuquerque * 505-248-0118

The U.S. House of Representatives voted last Friday to retool a defunct desalting plant near Yuma, Arizona. The Bureau of Reclamation (Bureau) estimates the cost of repairing the now obsolete plant technology at \$26 million. The decision was made despite the reality that operating the plant will destroy the majority of wetland habitat in the Colorado River delta region, and that far less costly measures are available to meet US treaty obligations for water delivery to Mexico.

"At a time when federal deficits are skyrocketing, it's unbelievable that Congress would consider throwing away taxpayers dollars to retool this plant, " says Lisa Force, program director for Living Rivers. "This is pork barrel politics at its worst."

The inclusion of the provision in the House report on the 2004 Energy and Water Appropriations bill allows for re-operating the Yuma Desalting Plant, a measure which the Bureau estimates will cost a minimum of \$36 million annually. Completed in 1992 at a cost of \$256 million to clean up brackish wastewater from farms in southern Arizona, the plant was shut down several months later due to extremely high operating costs. The Bureau of Reclamation has downplayed an alternative solution costing 33% to 85 % less--just \$6 million to \$26 million annually--involving paying willing sellers to lease water they presently do not need.

The agricultural wastewater that the plant would process is now funneled into the Cienega de Santa Clara, a 40,000-acre open water ecosystem in the Colorado River delta region. The desalting plant would remove the entire flow from the cienega and return only highly saline brine to the wetlands.

"This provision would destroy an extremely important wetland in Mexico that contains the largest remaining population of Yuma Clapper Rail in the world," says Bill Snape, Defenders of Wildlife Vice President for Law and Litigation. "It will be impossible to replace the value of the Cienega de Santa Clara to the Colorado River ecosystem."

The cienega is the largest remaining wetland in the southwest Americas and is home to fifty-six threatened, endangered and declining species. Several scientific studies funded by the Department of Interior confirm that the wetland would be completely destroyed by desalter operations.

"This is reminiscent of the days of old, when the Bureau wasted tax payer money left and right, leaving renowned habitat laid to waste," says John Weisheit, conservation director of Living Rivers and the designated Colorado Riverkeeper.

"We are disappointed that some members of Congress wish to move forward with such an expensive and destructive proposal. Congress mandated public involvement in Colorado River management but we fear the public is not being heard," says Steve Glazer, Chair of the Sierra Club Colorado River Task Force.

"We're fighting hard to ensure the Senate does not duplicate the folly of the House," adds Lisa Force. The U.S. Senate is expected to vote on the water and energy appropriations bill as early as this week.

LR Press Release 08/11/03

Sediment forces closure of Hite Marina

For immediate release
August 11, 2003

Contact: John Weisheit (435) 259-1063

Sediment makes access to Hite Marina impossible

Glen Canyon Dam hydropower at risk

As predicted two years ago by the environmental group Living Rivers in Moab, Utah, Colorado River sediment at Hite Marina has necessitated the removal of all reservoir conveniences such as the floating store, fuel docks, water and septic lines, boat rentals, and courtesy docks. With the blessing of the National Park Service the concessions operator, ARAMARK, has literally lifted anchor and towed their floating facilities down-reservoir to keep their investment from becoming engulfed in mud.

A "use at your own risk" boat launch currently remains open for the convenience of river runners and small, hard-hull boaters. Because Lake Powell reservoir is dropping fast, this primitive boat ramp will be completely unusable by the first of September, and will force river runners to go another 45 miles down-reservoir to exit instead at Bullfrog Marina.

The land-based facilities at Hite, which includes a store, gasoline, drinking water and a sewer clean-out, will remain open to service the needs of the residents and the traveling public.

In 1986 the Bureau of Reclamation determined that the delta for the Colorado River arm was located at Dark Canyon, which is 15 miles above Hite. The National Park Service and ARAMARK jointly authorized a sediment survey to be conducted by Mussetter Engineering of Denver in 2000. The engineers had determined that the delta advanced from Dark Canyon to the mouth of the Dirty Devil River at a rate of about one-mile per

year. At present the delta is just beyond Hite Marina where the original river channel is 245 feet below the full reservoir elevation of 3700 feet.

According to the 2000 survey, reservoir managers were given another 35 years of service at Hite Marina provided the reservoir could be maintained at full pool. "Such a projection is incredibly optimistic," says John Weisheit, conservation director of Living Rivers. "Considering the downstream demand for water, the present drought situation, and how the river erodes into the exposed sediment and feeds the delta, the facilities at Hite are basically history."

By April of 2004, Lake Powell reservoir is predicted to be 106 feet below normal. At this elevation, Bullfrog and Antelope Point marinas will also feel the effects of sustained drought. The boat ramp at Bullfrog is beginning to flatten out and the lack of incline will make it very difficult to load and unload boats--especially longer craft such as a houseboat and the highway department's ferryboat. Because Antelope Point is located on the rim of the original Colorado River canyon, the lowering reservoir level will perch this boat ramp high and dry. Already boat traffic is creating congestion problems at the narrows before Antelope Point and a no-wake designation is now being enforced to minimize hazards to navigation.

During the spring snowmelt, Lake Powell reservoir levels rose a mere 11 feet. Already the reservoir has returned to the levels of the previous winter. With no drought relief in sight, this continuing trend will eventually place power generation at risk too. The minimum storage level to safely produce electricity is set at 6 million acre-feet. Right now the reservoir is storing 12.7 million acre-feet of water at 50% of capacity. Power generation at Glen Canyon Dam could effectively end in two or three years under present drought conditions.

"This drought emphasizes the dubious nature of Lake Powell reservoir. By decommissioning Glen Canyon Dam we could restore five hundred miles of river to its natural habitat, which includes Grand Canyon National Park, while at the same time saving the water that is otherwise lost to evaporation," concludes Weisheit, who is also the designated Colorado Riverkeeper.

LR Letter 08/11/03

Proposed Modification to Mechanical Removal of Non-native Fish from the Colorado River in Grand Canyon Arizona, dated July 25, 2003

August 11, 2003
Mr. Dennis Kubly
Bureau of Reclamation
125 South State Street
Suite 6107
Salt Lake City, UT 84138-1107

Re: Proposed Modification to Mechanical Removal of Non-native Fish from the Colorado River in Grand Canyon Arizona, dated July 25, 2003

Via Fax and E-mail

Dear Mr. Kubly ,

Thank you for the opportunity to submit comments on Proposed Modification to Mechanical Removal of Non-native Fish from the Colorado River in Grand Canyon Arizona, dated July 25, 2003.

Living Rivers finds this proposed action constitutes improper science, thus an inappropriate deviation from the original objective. Living Rivers is also disappointed that this proposed action represents yet another example of how the Adaptive Management Program (AMP) is failing to address the long-term recovery needs for endangered fish, and merely perpetuating a reactive strategy with no demonstrated results.

1) No justification for altering the experiment

As noted in materials for the 13-14 August AMP meeting, it is clear that in-migration is occurring in the existing mechanical fish removal zone. The supplemental EA stated the contrary. (The EA should be re-written to reflect this new information, and released again for public comment.) Since there is no confirmation that the experiment is indeed permanently reducing non-native population to desired levels, there is no reason to contemplate any change in the experiment.

Second, while the experiment is certainly demonstrating that fish are being killed, there is no data to support the experiment is leading to improved Humpback Chub recruitment. It is improper to change the parameters of the experiment until such time as there is a demonstrated rationale to do so. Such is not the case at present, especially, as noted above, with migration now well underway.

Third, there has been no independent review of this proposal, a consistent recommendation by the National Research Council and the National Academy of Sciences of such GCMRC activities.

2) Demonstrated lack of focus on the long term objectives.

The investment of AMP resources in contemplating and studying the alteration of an incomplete, and so far, inconclusive experiment is yet another unfortunate example of poor leadership within GCMRC and the AMP. There is an extensive amount of work that needs to be undertaken to help recover Grand Canyon's native fish, the principle charge of the AMP. After nearly two decades, seven under the direction the AMP, the results have been abysmal. This is in no small part due to wasted resources, such as plans to alter an experiment with insufficient justification to do so.

A more appropriate investment in resources would be to begin studying and implementing mechanisms to address the need to reduce non-native fish with natural,

as opposed to mechanical approaches. An objective of the AMP is to reintroduce presently extirpated species, such as the Colorado Pikeminnow or Otter. Both such species would gladly feed on the non-native fish, likely at a much higher rate than the remaining natives.

With movement now by the AMP to address the need to warm the water, habitat conditions may be sufficient to support Pikeminnows. But the AMP need not wait until the temperature issue has been resolved to implement such a reintroduction, as it may petition to do so for experimental purposes, despite the fact that it is unlikely that the Pikeminnow can reproduce in the present system. However, if it appears that they are helping to significantly reduce the non-native population, with minimal impact to the native fish, and thus aiding in Humpback Chub recruitment, this would be cause to accelerate efforts to realize this species recovery as well.

While the Park Service has so far been resistant to Otter reintroduction due to inconclusive evidence regarding which sub-species dominated Grand Canyon habitat, it is clear that the increased interest and assumed need to increase predation on non-native fish, amplifies the call for implementation of a reintroduction plan.

Such nature-based proposals to mimic and rebuild the natural system should be the focus of the AMP, not short-term efforts to modify inconclusive experiments.

Thank you for your attention to these concerns.

Sincerely,

John Weisheit Conservation Director

LR Letter 08/13/03

Concerns regarding Glen Canyon Dam Adaptive Management Program

August 13, 2003

Mr. Michael Gabaldon Deputy Director of Operations U.S. Bureau of Reclamation
Department of Interior 1849 'C' Street, NW Washington, DC 20240

Re: Concerns regarding Glen Canyon Dam Adaptive Management Program

Dear Mr. Gabaldon,

The consistent message emanating from the Glen Canyon Dam Adaptive Management Program (AMP) is that it is failing in achieve its principal objective, the protection and recovery of endangered Humpback Chub (HBC). While the AMP and independent scientists debate how low HBC numbers are, all agree that they have declined considerably since the process began seven years ago. Living Rivers recognizes that AMP efforts are underway in an attempt to remedy this situation, but is very concerned that such efforts are not sufficiently comprehensive, nor do they justify hasty and inappropriate management practices.

Furthermore, Living Rivers believes that more than sufficient "new information" now exists to warrant the immediate undertaking of an entirely new, or supplemental, Environmental Impact Statement (EIS). Additionally, such new information also warrants an EIS be prepared for the planned Temperature Control Device (TCD) or the potential installation of generators on the dam's bypass tubes.

1. Emphasis on HBC numbers insufficient to address recovery needs

The AMP and Grand Canyon Monitoring and Research Center (GCMRC) focuses undue emphasis on yet conclusive approaches of counting of fish, and little to no resources on understanding their physical condition, nor the biological parameters necessary for their recovery. After nearly seven years of operation, all GCMRC has learned is that HBC populations are declining, but cannot determine by how much. The present estimate has an one hundred percent level of variability of 2,000 to 4,000 fish. Why has GCMRC yet to develop a mechanism to provided reliable fish counts, nor can the scientists within the AMP agree on whether the present counts constitute a crisis as far as the near extirpation of HBC in Grand Canyon?

The AMP's priority should not just be numbers of fish, but knowing their physical condition and what biological parameters must exist for preservation, and, as necessary, recovery. In 2000, Meretsky, et. al., published findings that indicated a possible decline in HBC condition since 1978. If true, such a trend would indicate that factors other than predation are effecting the HBC, and that undue emphasis on predation, as is presently occurring, won't address this problem. So far all reports and analysis by the AMP have focused on HBC numbers, and not their relative condition or health. While some of this data has been collected, there has not yet been any ongoing analysis of HBC condition factors as was recommended by Meretsky. Why?

Additionally, GCMRC has not developed sufficient information on HBC biological parameters. Such understanding is critical for making effective management decisions for the HBC future in Grand Canyon. At minimum, GCMRC should be investigating feeding habits, water quality, and recruitment and migration patterns for all periods of the HBC's lifespan. As the Little Colorado River presently represents the sole refuge for HBC in Grand Canyon, immediate emphasis should be placed on understanding the biological parameters to be persevered in this tributary to ensure this critical habitat is not disrupted.

Lastly, GCMRC must determine the population level, and changes in biological parameters, that would trigger a cessation of handling HBCs so as to avoid placing undue stress on the remaining population.

2. Inappropriate emphasis and approach to alien fish suppression

Scientist's are in agreement that predation by alien fish on HBC is limiting their recruitment, and thus suppression of these predators is warranted. While Living Rivers concurs, we find GCMRC's management choices are over-emphasizing this aspect of the problem, potentially to the detriment of the HBC recovery effort, and the scientific integrity of the AMP process.

First, the non-native fish suppression flows from Glen Canyon Dam represent a significant departure from the spirit of the EIS and the Record of Decision (ROD). While the flow levels themselves are within the ROD, they are being used in an attempt to affect non-native fish, not to directly affect native fish as was contemplated in the EIS. Any departure from the river's natural hydrograph is bound to have negative effects ecosystem-wide, not just the HBC. However, because the AMP has not sufficiently addressed the biological parameters for the HBC, it is not yet qualified to determine if, and to what extent, these alien fish suppression flows are impacting HBC recovery. It is also unclear if these flows have demonstrated any formidable change in trout populations. Plans to repeat these flows in 2004 are not prudent. Also, how could these increases in daily flows compliment a Beach/Habitat Building Flow planned for January if triggers are met? They seem at odds with each other.

Living Rivers is also concerned with the lack of independent review, and competitive bidding associated with contracts being let for monitoring the results of these experimental flows. When the AMP began seven years ago, it took pride in the independence afforded in the competitive bidding process for its science programs. Now, the vast majority of this work is being moved in house to GCMRC staff. When consultants are being used, as in the case of monitoring for these experimental flows, they are awarded without any competitive bid. This appears particularly suspicious in this case, since a contract was awarded to ECO PLAN Associates, which has been under contract with the Western Area Power Administration (WAPA). As these experimental flows would benefit WAPA and its customers by affording greater flexibility in power generation ramping, and that a variety of other consultants with greater experience in this area were not considered by GCMRC, AMP's appointment of ECO PLAN Associates has the strong appearance of industry bias.

Problems with the lack of independent oversight also appear to be surfacing with the mechanical fish removal program. The recent proposal to alter this program has been prematurely developed and submitted to the AMP without sound justification. The experiment has yet to demonstrate any impact on HBC recruitment, nor that in-migration is indeed not occurring in the target zone. Independent review of such proposals as recommended by the National Research Council should be standard procedure for such modifications to AMP activities to avoid such potential missteps in future.

A more appropriate and economically sustainable plan for non-native fish removal would be to study the reintroduction of natural predators. The management objectives of the AMP are to reintroduce presently extirpated species, such as the Colorado Pikeminnow or River Otter. Both aquatic predators species would gladly feed on the non-native fish, and likely not harm the native fish population.

The AMP could petition the US Fish Wildlife Service for an experimental release of the endangered Pikeminnow, despite the fact that it is unlikely that the Pikeminnow can reproduce in the present ecosystem. Thermal modification of the river could also provide the needed habitat for recruitment of these native predators. This scenario

would provide sustainable control of alien fishes in Grand Canyon while providing for the recovery of two native fish.

There has been resistance to studying River Otter reintroduction due to inconclusive evidence regarding which sub-species dominated Grand Canyon habitat. However, it is clear that the increased interest and assumed need to increase predation of alien fish, particularly trout, amplifies the call for a reintroduction plan. Such nature-based proposals to mimic and rebuild the natural system should be the focus of the AMP, not short-term efforts to modify inconclusive experiments.

3. Need for a Supplemental Environmental Impact Statement

The assumed environmental baseline associated with the Glen Canyon Dam EIS, and the launching of the AMP has little bearing on reality. Options allowed under the ROD have been attempted and have proven to be ineffective, leading to continued impairment to all significant downstream resources since the ROD was implemented. This is now placing the AMP in uncharted territory, as evidenced by the implementation of trout suppression flow not contemplated by the EIS or the ROD. Furthermore, the continued drought conditions are effecting reservoir levels, and soon, water temperature and dam operations in a manner not evaluated in the EIS. The AMP is effectively operating without a net, and must advise the Secretary of the Interior to call for a supplemental EIS to guide and inform its future programs.

The most significant changes are in HBC populations and sediment budgets. While the AMP has yet to agree on how bad the current HBC count is, there is no doubt that the population is in significant decline since the program began. Furthermore, there has been no movement on establishing a second population in the mainstem Colorado. Beach building efforts under the ROD have not worked in a sustained manner. The number and size of beaches in the Grand Canyon have experienced a significant decline since the AMP was put into place. Not only has this negatively effected the Canyons recreational experience, but has also impacted the river corridor's cultural resources which are now prone to erosion.

Anticipated upstream impacts associated with reduced elevations of Glen Canyon Reservoir (i.e. increased temperatures, modified nutrient dynamics, etc.) will have significant effects on the downstream resources in the Grand Canyon. As the drought situation persists, these effects will become most pronounced once reservoir levels fall below the elevation of the penstocks.

The key to reinitiating compliance with the National Environmental Policy Act, through a supplemental EIS, is if new data or impacts are recognized. Clearly in the case of Glen Canyon Dam and Grand Canyon National Park, significant new data (biological and sediment) indicate that the ecosystem needs to be reevaluated and assessed. The fact that new data on the HBC, sediment deposits, cultural resources, water quality, and reservoir levels show that decisions made on the original data from the Glen Canyon Environmental Studies is now in need of reassessment.

Thank you for your attention to these matters, and we look forward to your reply.

Sincerely,

John Weisheit Conservation Director

LR Press Release 08/15/03

Draining Update: 50 percent--forcing marina closures.

Marinas left high and dry, power generation next to go.

Contact:

John Weisheit (435-259-1063 or 435-259-8077)

Lake Powell reservoir is down 90 feet from normal, equating to a reservoir that is half full. The National Park Service, which manages marina facilities at Lake Powell, is at the beginning of shutting down marina's because they can no longer accommodate launch vessels. Meanwhile, Glen Canyon Dam is just two years away from no longer being able to generate hydroelectric power.

Now in the fourth year of an anticipated sustained drought, Lake Powell reservoir will soon be empty. Forecasters have informed the Park Service that the reservoir levels will only be getting lower. The reservoir is dropping faster than it can be replenished.

The United States Geological Survey 2002 report on Southwest climate change predicted that the Colorado Plateau would be heading into a 30-year period of below average river flows. Previous estimates by forecasters, on the impacts of such a sustained drought, calculated that Lake Powell would be drained within eight years. It's right on schedule. In July 1999, Lake Powell was at 90 percent. As of August 1, 2003, it was at 50 percent.

If the present drought does not relent, within two years Lake Powell will drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam. According to a model that was published in October of 1995 in the Water Resources Bulletin, if a severe and sustained drought similar to the drought of the late 16th century appears, Lake Powell could stay drained for eight years.

"We're witnessing the end of Lake Powell right now," says Living Rivers' Conservation Director John Weisheit. "This was predicted, and nothing the National Park Service or the marina operators can do will change this."

- Two of Lake Powell's six boat ramps have been closed, and another will be closed by the end of the season. River sediment has brought an end to the marina at Hite at the top of the reservoir. At the other end of the reservoir, near Glen Canyon Dam, Antelope Point's marina facilities will soon be forced to again close because they will be perched atop a cliff being exposed as the reservoir lowers. This, just four years after construction in 1999.

- A \$3 million emergency appropriation was made in January to extend three other boat ramps at Bullfrog, Hall's Crossing and Wahweap marinas. But as the reservoir continues to lower, Bullfrog marina may also see its facilities shut down. Wahweap and Hall's Crossing will probably be able to stay open until the reservoir completely drains.
- A new \$75 million marina facility is supposed to be under construction at Antelope Point, but with a 500-foot cliff being exposed where the launch ramps are proposed, progress has stalled. Calls to Antelope Point Holdings and their engineers, revealed no comment to the feasibility of the project..
- The fate of the white-water rafting industry, which concludes trips at the top of Lake Powell, is also a major question. With sediment and mud clogging the marina and boat ramp at Hite, rafters will have a very difficult time getting off the water.

"As the drought persists, it is going to be very difficult, if not impossible, to conduct business as normal with the river and reservoir users. This includes the Grand Canyon river runners who will lose the large Glen Canyon Dam releases they need to run their large motorized boats through the canyon only to arrive at the sediment-choked Lake Mead," adds Weisheit.

Lake Powell is not the only problem. The entire Colorado River storage system has dropped from 92 to 60 percent over the past 44 months. "Lack of access to flat water recreation is the least of our worries," concludes Weisheit. "The Southwest plumbing system is headed for complete catastrophe, and the Bureau of Reclamation and the seven states that use Colorado River water have no disaster preparedness."

Colorado River Battle: 100 Years of Water War

Deal: Thirsty California, desperate for water, is willing to pay reluctant farmers billions to get some of their surplus.

By Alec MacGillis

Baltimore Sun National Staff

EL CENTRO, Calif. - Inch by inch, the life's blood of a large swath of the United States - Colorado River water - seeped across the desert. Or rather, across the desert that is now Mike Cox's cotton field.

For Cox, circling the field in his pickup truck to check on the water's progress, soaking his cotton is a routine procedure. Every 10 days during the summer, he uses 7.8 million gallons of water diverted by canals from the Colorado River to irrigate the 70-acre field, just a fraction of the 1,000 acres he farms in California's Imperial Valley.

But for the rest of the Southwest, Cox's routine watering represents something more significant. In this single irrigation of a tiny corner of a broad farming plain, Cox used about as much water as 50 households use in a year - as much as all their showering, toilet-flushing and dish-washing put together.

This is the explosive equation at the heart of the battle that, after gripping the Southwest for years, is now nearing a climax.

With the cities of the western Sun Belt booming, much of the water from the Colorado River, the main water source in a parched region, continues to be used by only a few hundred farmers in the Imperial Valley along the Mexican border.

The valley won the right to the water more than 100 years ago and has guarded it ever since. But in a historic shift, the Southwest is now on the verge of a landmark transfer of Colorado water from the Imperial Valley to San Diego.

The deal, which negotiators hope to seal by next month but which could still collapse, might help resolve a conflict that has been building for a century.

The war over Colorado water has pitted cities against farmers, fomented tensions among seven states, and dominated the attention of Native American tribes, environmentalists, federal officials and Mexico. The water wars have transformed a whole corner of the country, from the construction of vast cities on arid plains to the accidental creation of a sea in the middle of the desert.

For the 25 million Americans who rely on the river as it flows 1,400 miles from the snowpacks of the Rocky Mountains to its delta across the Mexican border, the outcome of the negotiations is nothing less than a matter of their region's survival.

"The big picture is that there are more rights to water from the Colorado than there is reliable water in the river," said Robert Glennon, a law professor at the University of Arizona. "We have a train wreck ahead of us."

Under the deal, San Diego would pay the Imperial Valley \$2.5 billion over 45 years to receive about 7 percent of the valley's share, water made available by more efficient irrigation. The water would compensate for the cutback California faces because of higher usage in Arizona, which now stores river water underground, leaving less for its western neighbor.

The deal, which also includes several smaller transfers within California, looks like a win-win arrangement. San Diego would get a reliable new source of water, while the Imperial Irrigation District would be able to sell water to San Diego at a rate 16 times what its own farmers pay.

But in the kind of twist so common to the water wars, a possible deal-breaker arose last year. Conserving water on Imperial farms, it turns out, would doom the Salton Sea, the giant lake in the middle of the desert at the valley's edge, imperiling millions of birds for which it is a key stop on the Pacific flyway.

Last week, amid the hoopla of the effort to recall Gov. Gray Davis, negotiators spent long days in Sacramento seeking a way to split the cost of protecting the sea and still salvage the transfer.

It is a surreal situation, with all the water machinations of the classic film Chinatown: Because of water being pumped into the Arizona sand, farmers in the California desert are being urged to sell water to a port city but are being held up by the danger of causing a landlocked sea to vanish from the Earth.

A century of change

It seemed simpler when farmer Cox's predecessors in the valley won rights to the water more than 100 years ago. Phoenix was a desert town of 5,000, San Diego a fledgling port city of 17,000 and the river water was the farmers' for the taking.

One century later, the farmers are not about to give up the water easily, no matter how many Beverly Hills lawns or Las Vegas casino gardens need to be kept a luscious green.

"It does take a lot of water, but I get a lot of production out of it," said Cox, 52, as he looked down his cotton furrows to monitor the water, which is drawn from an irrigation ditch by small siphon hoses and flows by gravity across the slightly slanted field. "Why is it OK for [cities] to use it in their fountains and spray it on their sidewalks? I think I have the right to use it for productive purposes."

But to many in the Southwest, such farmers' claims represent an entitlement the region can no longer afford. Phoenix, which has grown 75 percent in 30 years to 1.4 million people, will soon surpass Philadelphia as the fifth-largest U.S. city; Las Vegas, a railroad town of 5,000 in 1930, now has a metropolitan area population of 1.5 million.

This boom has caused the most problems for California, which uses more Colorado water than any other state. For years, California has taken more than its allocated share of the river because other states haven't used their full amount.

Now, with the Southwest growing fast and suffering a long drought, there's less extra water to go around, and California is under strict orders from the federal government to cut back.

The pressure on California is driven most by Arizona, which profoundly altered the region's water equation with the construction, in the 1980s, of a 336-mile aqueduct to carry Colorado water over the mountains and desert as far as Tucson.

This has allowed Arizona to claim its full share of river water, even though it doesn't actually use the full amount. Instead - in a tactic viewed as being unfair by some, brilliant by others - it pumps surplus water into the ground, reserving it for future use and thereby leaving no surplus for California.

Forcing California to cut back to its allocated share of the river would hit hardest in Southern California's sprawling cities, which have the legal right to far less than the state's farms, and therefore have been relying heavily on the leftover water.

That's where the deal comes in. By transferring Imperial water to San Diego, California can gradually wean itself from excessive use of the river.

Imperial Valley leaders were close to signing on to the transfer late last year when they balked, worried that the valley would be liable for the cost of restoring the Salton Sea, estimated to be as much as \$2 billion. The 15-by-35-mile sea, created when floodwaters on the Colorado broke an early canal to the Imperial Valley in 1905, depends on runoff from valley farms as its main water source.

Reducing runoff would rapidly shrink the sea, threatening the birds that, deprived of other wetlands, now rely on it.

As a penalty for pulling out of the deal, Interior Department Secretary Gale A. Norton cut the valley's river allocation by 10 percent last winter, saying that farmers were wasting water.

It was a major step: The Interior Department, which has the authority to withhold water if it's not put to "reasonable and beneficial use," had rarely invoked the right before. The valley sued in protest.

Unlike the backroom water deals in Chinatown, dealing over the transfer has played out in public view. In a region where residents face rising water bills and threats of rationing, water politics is front-page news.

If a deal is reached, it could be the blueprint for future transfers from farms to ever-thirstier cities, possibly spelling the decline of agriculture in the region.

The transfer is "a model for how historic distrust between urban and agricultural water interests can be overcome," said Dennis Cushman, assistant general manager of the San Diego County Water Authority.

But if the deal falls through and Imperial farmers are forced to give up water anyway, they say they'll defend their century-old rights to the end.

"If we have to fight them in the Supreme Court, that's what we'll do," said John Pierre Menvielle, a third-generation farmer who is running for the Imperial Irrigation District board, a paid, five-member panel elected by the voters of 140,000-resident Imperial

County. "We got some hard-headed people down here - maybe because we've been in the heat for too long."

The river's journey

Once a raging river, the Colorado now peters out in marshes well short of its outlet in the Gulf of California.

It barely makes it that far. Massive dams halt its flow for storage and power generation, and wide canals carry off its water like so many needles stuck in a blood donor.

Near Parker Dam, one aqueduct heads west carrying about 1.2 million acre-feet of water a year 242 miles to Southern California, while close by another carries 1.5 million acre-feet a year 336 miles east into Arizona. (An acre-foot is the amount of water needed to cover an acre of land at a depth of 1 foot. It is about 326,000 gallons and is roughly equal to what two households use in a year.)

Farther south, near the Mexican border, 3 million acre-feet of water a year are diverted into the All-American Canal, the 82-mile canal built in 1942 to carry water into the Imperial Valley. From the canal, the water flows into a network of smaller canals connected to irrigation ditches.

The broad reach of Colorado River water is extraordinary because it is not a particularly big current to begin with, with an average depth of only about 20 feet and an annual flow that is only 3 percent of the amount of the Mississippi River's.

Indeed, seen from the riverbank at Blythe, Calif., on the border with Arizona, the Colorado looks like any other medium-size river. A few small trees sprout on its bank. Children in life vests are paddled upstream in a canoe. A man on a jet ski roars up and down.

In effect, many say, the Colorado today is less a river than a glorified water main serving seven states - a main that happens to have carved out the Grand Canyon eons ago.

"The river is extremely generous - as a desert river it produces a lot of water," said Lisa Force, a program director for Living Rivers, a group seeking to reduce Colorado River water use. "But it was seen as inexhaustible, and it's not."

Valley of green

The mining of the river began in earnest more than 100 years ago when enterprising farmers made a discovery that would change the Southwest forever: The California desert near Mexico may look bleak, with less than 3 inches of rainfall a year, but sprinkle water on it, and it turns to gold.

The desert adjacent to the river was made of silt carried from the Grand Canyon and elsewhere upstream, deposited in a broad swath by the river's shifts in direction. When irrigated, this soil was extremely fertile. And with the warm climate, farmers had a far-longer growing season than those in the rest of the country.

Cox, who has farmed for 30 years, marvels at the founders' ingenuity every time he drives out of the valley and reaches the point where green fields stop and the brown desert resumes.

"I'm in awe of this valley," he said. "I'm in awe of the people who had the foresight to divert the water from the river."

Backing up the farmers' discovery was the law. When it comes to allocating natural resources, the East operates on riparian rights: You can use water your property abuts, as long as you're not taking from your neighbor's fair share.

Not so out West. Ever since the gold rushes of the mid-19th century, natural resources on the frontier were awarded on a first-come, first-served basis. By diverting water into the desert, farmers not only won themselves newly fertile land, but they also secured the Imperial Valley's place in a series of compacts and court rulings that make up the "law of the river."

In 1922, an interstate compact divided the river's annual flow in two portions: 7.5 million acre-feet to the upper basin states of Utah, Colorado, Wyoming and New Mexico; and 7.5 million to the lower basin states of California, Arizona and Nevada. In a 1944 treaty, Mexico won rights to 1.5 million acre-feet a year.

Shares among the lower basin states were settled by the Supreme Court in 1963: California got 4.4 million acre-feet, Arizona got 2.8 million, and Nevada got 300,000. Within California, the Imperial Valley and some smaller farming districts eventually were allocated 3.85 million acre-feet, while the Metropolitan Water District, which delivers water to 18 million people in Southern California, gets only 550,000.

After all the divvying up, the Imperial Valley receives about 3.1 million acre-feet a year. That's more than all of Arizona, and nearly one-fourth of the river's flow, which has averaged about 13 million acre-feet a year, far less than the 15 million assumed in the original divisions.

This worked well enough for years; California was able to take as many as 800,000 additional acre-feet a year left over by other states. But in the past decade, the arrangement has been badly strained. Not only have Arizona and Nevada started claiming their shares, but a four-year drought has further reduced river flow.

The crop debate

With supplies running short, scrutiny has fallen on the Imperial Valley's \$1 billion farming industry. Most of the valley's 470,000 acres is in water-guzzling field crops, mostly alfalfa and other grasses that feed the West's dairy and beef industries, as well as cotton, wheat and sugar beets.

Only about 55,000 acres are used for vegetables and melons, which use much less water per acre than field crops. The area's long growing season makes it ideal for winter vegetables, and its lettuce, asparagus, broccoli, cauliflower, onions and carrots are its most lucrative crops on a per-acre basis.

But many farmers prefer field crops: Their prices fluctuate less, due partly to federal price supports; they require less labor; and farmers say there is limited demand for vegetables.

"We have a huge amount of water being used in inefficient ways for crops that one might question why they're being grown in this area," said Joseph L. Sax, a law professor at the University of California, Berkeley who has consulted for the Interior Department. "It's a good place to grow avocados, but why we're growing cotton and alfalfa here is a question a lot of people have been asking for some time."

Meanwhile, having enjoyed a large share of river water for so long, valley farmers have seen little reason to limit use.

The valley's canals are unlined, allowing water to seep through their borders. Irrigating by gravity means that 15 percent of the water used runs out at the end of the field, runoff that goes into the Salton Sea. Some farmers, like Cox, now use pumps to recycle some of the runoff, but the pumps, and more costly conservation tools like drip irrigation systems, are relatively rare.

"They won't admit they're wasting water," said Adan Ortega Jr., vice president of the Metropolitan Water District. "Because they believe they have this God-given right to the water, they don't have any incentive to preserve it."

This kind of talk infuriates Imperial Valley farmers, who say they would use more efficient irrigation if they could afford it. Already, they say, they've spent thousands on tiles placed beneath their fields to keep salt from sinking too far into the soil.

Moreover, they say, it's their thousands of tons of field crops that fuel California's dairy industry (the largest in the country), feed the Southwest's cattle and help maintain America's cotton industry.

"Where's this agriculture going to go? It has to go someplace," said Steven A. Pastor, director of the Imperial County Farm Bureau. "You need your feed grown, your cotton. Do we want to rely on other countries to supply our food and fiber?"

Heidi Kuhn, an activist whose husband owns and runs one of the valley's largest farms, sums up the argument with a simple refrain for what she calls "the person sitting in Starbucks": "We're the latte in your coffee."

"We're not just doing this for our own health. We're doing it because there's a market need for it," she said. "I don't know if growing food is any less beneficial than having 112 golf courses in Palm Springs."

Hard-won success

On a tour of her family's 14,000-acre, 300-employee operation, Kuhn shows just how productive a single Imperial Valley farm can be. After passing field after field of the Kuhns' hay crops, she stops at the vast lot where the grasses are baled, compressed and stacked by the hundreds under long sheds.

Many of the bales, a grass variety called Sudan grass, will be loaded in containers to be transported to California ports by the train line running adjacent to the lot. There, they will be shipped to Japanese ranchers, who prefer Sudan grass for cattle feed but lack room to grow it.

Other bales will go to California dairies, but many stay with the Kuhns, to serve as feed at their own 4,000-cow dairy. The dairy's milk, in turn, goes across the street to a cheese-making plant that produces Muenster and Swiss cheese.

It's a thriving operation, but Kuhn says it's not hugely profitable, given slumping commodity prices and the cost of state labor and environmental regulations. Her family recently moved into her mother-in-law's old house, a three-bedroom rancher with a cracked tennis court. It's one of the nicer houses in El Centro, a struggling town of small bungalows and shuttered stores, but it's no mansion.

Indeed, many valley landowners resent the widespread notion that their big share of Colorado water has made them wildly wealthy.

"They see us driving nice pickups and cars and having a house in San Diego," said John Grizzle, a valley farmer since 1964, sitting in the office of his 7,000-acre operation. "They don't realize the hard work and the risk involved. The return on our investment is not large."

As they fend off critics, the valley's residents also face internal divisions.

There are disagreements about how to divide the \$2.5 billion San Diego would pay for the 200,000 acre-feet a year it would receive under the transfer. As the deal stands, the Imperial Irrigation District would distribute most of the money among the county's roughly 400 farmers, requiring much of it to be used for more efficient irrigation, while some would go toward the larger community.

A large faction of farmers, though, believes that the money, as well as any revenue from future transfers, should go directly to landowners, who in turn would give part of it to the community. This group has sued the irrigation district.

Others view this effort as a naked grab by farmers for the millions in water revenue.

"We better make sure that if the money comes in, it's applied to increasing efficiency, to insulate us against long-term attacks on our water use," said district board member Andy Horne. "If landowners are allowed to take the money and do whatever they want with it, including sticking it in their pocket and not doing anything toward efficiency, then we haven't accomplished that."

Farmers also disagree over whether to reduce their usage by investing in more efficient irrigation or by leaving fields fallow, which would mean lower crop yields and fewer farm jobs but would require less effort and leave more water for the Salton Sea than conservation would.

To valley outsiders, the ambivalence over the transfer is hard to fathom, given how much money is involved. The valley would get \$258 an acre-foot from San Diego for water that costs farmers \$16 an acre-foot.

"What they're not admitting is that these are the first farmers that will be allowed to sell water at market rates," said Ortega, of the Metropolitan Water District. "They're going to create a precedent that a lot of people in the valley can benefit from."

But this is just what alarms many in the valley - including some of the non-landowning Mexican immigrants who see the farms as the biggest source of employment in the county. Once farmers start selling water, they fear, it may be hard to stop; farmers will walk away rich, but the valley will have sold away its livelihood.

One thing unites the county residents: All see themselves as underdogs trying to keep their rights from being pried away by powerful California cities.

"We can see the handwriting on the wall: We have a very large water right, and there is a seemingly unquenchable thirst for this water around the southwestern United States," said district board member Horne. "We're such a small community facing such a huge population that doesn't care what happens to us in the future."

And all in the valley think the same thing when they hear urban critics question the wisdom of desert farming: Why doesn't the same argument apply to the cities of the arid Southwest?

"San Diego is as much of a desert as we are," Kuhn said. "Why is it any more logical for people to live there?"

Growing demand

It's a question that San Diego officials don't have the luxury of asking. Whatever the wisdom of its growth, the city is now the country's seventh largest, it lacks water of its own, and officials need supplies for 3 million area residents and counting.

The transfer deal with the Imperial Valley is the centerpiece of this effort, but it's not the only element. The San Diego County Water Authority is planning a desalination plant that would process enough ocean water, at great cost, to provide 15 percent of the county's demand.

In addition, the authority is about to finish a massive new dam in a box canyon in Olivenhain, 30 minutes north of the city, that will hold more than two months' supply of emergency water. The aqueducts that bring San Diego's water south from Los Angeles, a mix of Colorado River and northern California water, cross major fault lines, and the city's been at risk of running dry after an earthquake.

The new dam is visible proof of water's primacy in the Southwest. At 318 feet high and 250 feet long, it is designed to withstand an earthquake measuring a magnitude of 7.2. The reservoir, a giant cavity that will be filled over the coming year, is 2,552 feet long; 700,000 cubic yards of fill was blasted out of it.

"With the amount of water we have to deliver to people, we just have to build some amazing structures to do it," said project manager Jerry Reed as he oversaw work on a recent morning.

That is what happened hundreds of miles away in Arizona, where two decades ago engineers designed an aqueduct to carry 1.5 million acre-feet a year of Colorado River water as far as Tucson. The \$3.8 billion Central Arizona Project uses six 60,000-horsepower pumps to lift water 824 feet above the river.

Fourteen pumps along its 336-mile route lift the water high enough so it can run downhill to the next pump. At a control room north of Phoenix, two men sitting before a big screen regulate the flow on the 80-foot-wide, 16-foot-deep canal by raising or lowering gates at checkpoints every seven miles.

Things to come

The Arizona aqueduct represents more than just the driving force behind the pressure on California to reduce its river use. The project also offers hints of what might happen in California if the San Diego water deal sets a precedent for future transfers.

That's because in Arizona, transferring water from agriculture to urban use has been the policy for decades. Unlike their counterparts in the Imperial Valley, the cotton and alfalfa growers on the plains of central Arizona lack enshrined rights to the Colorado River, and have long relied on groundwater.

When the state built the aqueduct, it allocated two-thirds of the water to farmers - but with the understanding that their share of the water would decline as farmland was developed for homes, leaving most of the water for urban users. And indeed, large tracts of former farmland around Phoenix are sprouting dense subdivisions.

This sprawl has met with relatively little official resistance. Subdivisions may cause problems, officials reason, but they have one thing going for them: They require about half as much water as the farms they replace.

"We want to sustain agriculture as long as possible, but while making sure we have a sustainable water source" for residential use, said Dennis G. Kimberlin, a state water manager in Pinal County, an agricultural area south of Phoenix that is rapidly being developed.

Those farms that remain, meanwhile, have already taken many of the steps that California farms may face. Because water is at a greater premium in Arizona, costing farmers \$36 an acre-foot - more than double the Imperial Valley rate - there is incentive to conserve.

Dan Thelander, for instance, added an underground drip irrigation system four years ago at his 500-acre cotton field in Pinal County. It cost \$1,500 per acre, but his cotton now uses one acre-foot less per acre.

His neighbor, C.L. "Bill" Scott, long ago leveled many of his fields so that less tailwater runs out at the end. Instead of irrigating his fields at a steady stream for a full day as Cox does in the Imperial Valley, Scott sends a stronger stream across for only two hours, producing a more even level of saturation while using less water.

Scott happens to know the Cox family and isn't about to second-guess their techniques. He chalks up his conservation to market demands: His water costs more, so he must use less.

"There are a lot of things you can do to make better use of water," he said, driving a visitor across his 6,800-acre farm. "It's a matter of economics. It makes you do things that are cheaper."

Future battles

Even if the transfer from the Imperial Valley to San Diego is approved, few expect the deal to settle the water wars for good.

Other demands for water loom: The state of Colorado is discussing building its own version of the Central Arizona Project to carry its share of the river over the Rockies to Denver and other cities. This may be prohibitively expensive, but if it happened, it would remove 400,000 more acre-feet a year from the river, about 3 percent of its flow.

More immediate is a drive by environmentalists to allow more of the river to make it to Mexico, to start restoring the delta, at a cost of 150,000 acre-feet a year. And in Arizona, Native Americans winning rights to hundreds of thousands of acre-feet, forcing cities to buy water from them.

But the biggest fights ahead, many expect, will be continued clashes between cities that will need ever more water and farms that still use most of it.

Regional water officials admit they may eventually push the limits of their supply, even with the transfer. This, they say, will force higher water prices, constraining further growth, and may even raise the once-unthinkable prospect of "toilet-to-tap," treating wastewater for drinking use.

Aware of the growing needs of the cities, Imperial Valley farmers say they are bracing for the federal government, goaded on by the Metropolitan Water District, to return and pressure them to give up even more water. If the valley refuses to sell, they fear, federal officials will again declare it is wasting water and take the water for free.

"It's a slippery slope," said Pastor, the farm bureau director. "A lot of farmers worry this isn't going to end until all the water is shipped to San Diego or Los Angeles."

Valley landowners say they owe it to their forerunners on the land not to let that happen. Their critics may question the wisdom of having created a farming valley in a desert, they say, but the transformation happened, and it can't just be reversed, 100 years later.

"This place is not unworthy of being here. It's families who are proud to be here, who put roots here, who had kids here," said Kuhn, the activist. "It's not as simple as wiping us off the map to have more water for L.A."

PECOS RIVER MANAGEMENT PLAN UPDATE

An Environmental Assessment containing the Pecos Wild and Scenic River Forest Plan Amendment and Management Plan was sent out for public review on April 23, 2003 thirteen years after its declaration as a Wild and Scenic River. The proposed management plan banned all boating in the Wild and Scenic Corridor as it "can only be done in short sections along the river during periods of high water flow, which commonly does not occur. Prohibiting floating would therefore not be expected to displace many users and it would enhance fishing within the corridor."

The Pecos River was declared a Wild and Scenic River in 1990. Above Cowles (mostly in the Pecos Wilderness) is designated wild. From Cowles to Terrero is designated recreational. The section from Cowles past Terrero to Windy Bridge is runnable by kayak, canoe and inflatable kayaks during spring high water each year. This is a period of heavy boating use of other rivers in New Mexico and the Pecos serves as an alternative run for boaters looking for more solitude. Although there is development along the road to Cowles, the sections of the river away from the road retain much of the wilderness characteristics of the surrounding Pecos Wilderness. The run is unique for New Mexico due to the clear water and forested environs that are reminiscent of rivers further north in Colorado and Idaho. Although the area is very popular for fishermen, they generally prefer lower water levels when the river is unrunnable by boaters.

Tom Robey (River Runners for Wilderness) noticed the public comment period for the management plan and Tim Scofield (Adobe Whitewater Club) discovered the prohibition on boating. Enlisting the help of Jason Robertson (American Whitewater Association) they undertook a campaign during Memorial Day weekend to send in comments. An excerpt from the comments submitted by Tom Robey stated:

"...There is no reasonable basis that eliminating boating would enhance fishing. It is evident that there have not been any recreational surveys of boating use on the Pecos River. Have you done any surveys of fishermen about their encounters with boaters? Have you documented any adverse impacts of boaters upon fishing? My experience is that very few fishermen encounter boaters and that encounters between fishermen dwarf any such impacts. As fast as the Pecos is moving during high water (there are few eddys) it is ludicrous to suggest that boaters have any impacts on the fish or fishing. Therefore I suggest that the management plan allow boating and that the Forest Service gather data before even considering any management action regarding boating between Cowles and Terrero."

The first item of the Decision Notice issued July 31st stated:

"Revised the provision to allow floating use. The Standard now reads, 'The use of non-motorized rafts, boats, or other conveyances to float down the river is permitted. No additional facilities (put-ins, parking areas) will be constructed to facilitate floating' ",

The entire decision and other materials should be available at www.fs.fed.us/r3/sfe or upon request from the Pecos/Las Vegas Ranger District, PO Drawer 429, Pecos, NM 87552 (phone 505-757-6121).

Drought drying up boater fun

by Tom Wharton

The Salt Lake Tribune

Prolonged drought in the western United States, particularly Utah, has left boaters high and dry on launches at many major lakes and reservoirs.

At Lake Powell, water levels have dropped below boat ramp and marina access levels, forcing closures, especially in the upper end of the huge reservoir on the Utah-Arizona border. Visitation is down 13 percent from a year ago. And the lake level is expected to drop even farther, perhaps as far as 112 feet below capacity by April. Still, Barry Wirth of the U.S. Bureau of Reclamation said there are still 12.5 million acre-feet of water in the reservoir.

"That is an awful lot of water," he said. "It is important to note that that is a pretty nice half-full body of water."

Char Obergh, of the Glen Canyon National Recreation Area, said boaters have experienced few delays launching despite the closure of Hite Ramp and "use at your own risk" warnings at Stateline and Antelope Point, a precaution to boaters that they could get stuck in the muck, or worse.

She expects some launching delays to occur during the upcoming Labor Day weekend.

"It has been an interesting year," she said. "But there is a lot of lake to enjoy. It's just a different lake. We are asking people to be aware of that. We have done our best to maintain access. As it goes down this winter, we will be faced with additional challenges."

Because of low water at Lake Powell, Defiance House and Three Roof Ruins are no longer accessible by water. The Castle Rock Cut is closed. And vehicle access is not possible at Dirty Devil, Farley, White Canyon, North and South Bullfrog Primitive Camping Area and Crosby Canyon. Stanton Creek may be the best primitive vehicle camping area still available.

On the upper end of the lake, Hite Marina is out of service. The launch ramp there is closed, though river runners floating down from Cataract Canyon on the Colorado River are using a temporary dirt facility. All water-based marina facilities have been relocated downstream.

These developments have not gone unnoticed by environmentalists who would like to drain Lake Powell and decommission its dam.

"This drought emphasizes the dubious nature of Lake Powell reservoir," said John Weisheit of Moab-based Living Rivers in a news release.

"By decommissioning Glen Canyon Dam, we could restore 500 miles of river to its natural habitat, which includes Grand Canyon National Park, while at the same time saving the water that is otherwise lost to evaporation."

Low water apparently has not affected boating safety, either on Lake Powell or other reservoirs across Utah.

"We have had no safety problems out of the ordinary," said Obergh. "We do caution people if they have not been here for a while that it is a different lake and they need to boat with caution."

Ted Woolley, boating coordinator for the Utah Division of Parks and Recreation, said added congestion among boaters has not contributed to safety problems.

"It seems that when you get more people in there, they pay more attention to what is going on," he said.

Visitation has been down at some water-based state parks because of perceptions -- some real, some not -- that the drought is affecting boating. But Woolley said there are plenty of good boating opportunities if you know where to look.

"We have some areas in good shape and some that are in real poor shape," he said.

He listed eastern Utah reservoirs such as Starvation, Red Fleet, Steinaker and Flaming Gorge as good boating alternatives that, in some cases, have been underused this summer.

Closer to the Wasatch Front, Rockport, Jordanelle, East Canyon and the Great Salt Lake are relatively safe for boating.

Perhaps the biggest problem area is Willard Bay, where the south marina has been closed and the north marina is available for personal watercraft and smaller boats. But, Woolley said, boaters should use Willard Bay at their own risk because rescue boats are not available.

Yuba Reservoir has been drained for dam repairs, and Lost Creek Reservoir's ramp is not available. The main ramp at Deer Creek Reservoir State Park is out of the water, but boaters are still launching on the dirt ramp at the Island area. Trailer parking, however, can be a problem there.

Utah Lake's boat ramp has major problems, though some boaters are launching smaller craft. Bear Lake's marina is still OK for motor boats, but some sailboaters are experiencing problems. Echo Reservoir is about 50 percent of capacity but is still in use. Pine View reservoir is also low, but there is adequate water for launching.

River News 08/25/03

Sediment Clogs River Runner Access At Former Hite Marina

Submitted by Tom Robey on Mon, 08/25/2003 - 23:00 August 2003.

Sediment at Hite Marina, the most upstream facility at Powell Reservoir, has necessitated the removal of all reservoir conveniences such as the floating store, fuel docks, water and septic lines, boat rentals, and courtesy docks. The concessions operator, ARAMARK, has towed its floating facilities down-reservoir to keep the facilities from becoming trapped in mud. The land-based facilities at Hite, which includes a store, gasoline, drinking water and a sewer clean-out, remain open to service the needs of the residents and the traveling public.

A primitive "use at your own risk" boat takeout area opposite the former Hite boat ramp can still be used by river runners for inflatable and small, hard-hull boats. Since Powell Reservoir continues to drop rapidly, this site could be completely unusable by September, which will force river runners to go another 45 miles down-reservoir to exit at Bullfrog Marina. Glen Canyon National Recreation Area currently has no plans to accommodate river runners by constructing an alternate ramp, despite spending over \$1 million earlier in the year to temporarily extend ramps for houseboats and power boats. A description of the takeout site is posted at Canyonlands National Park's Cataract Canyon website at <http://www.nps.gov/cany/river/lakepowell.htm>.

According to a sediment survey conducted by Mussetter Engineering of Denver in 2000, the Colorado River delta beginning at Dark Canyon and reaching to the mouth of the Dirty Devil River was advancing at a rate of about one mile per year. At present the delta is just beyond Hite Marina where the original river channel is 245 feet below the full reservoir elevation of 3700 feet. The survey predicted another 35 years of power boat access at Hite Marina provided the reservoir could be maintained at full pool.

"Such a projection is incredibly optimistic," says John Weisheit, Conservation Director of Living Rivers. "Considering the downstream demand for water, the present drought situation, and how the river erodes into the exposed sediment and feeds the delta, the facilities at Hite may never again be usable."

By April of 2004, Powell Reservoir is predicted to be 106 feet below normal. At this elevation, Bullfrog and Antelope Point marinas will be affected by the sustained drought. The lack of incline and shallow depth at the Bullfrog Marina boat ramp will make it very difficult to load and unload boats--especially longer craft such as houseboats and the Bullfrog-to-Halls crossing ferryboat--the only method of transporting land vehicles across the 186-mile-long reservoir. Because Antelope Point is located on a cliff at the rim of the

original Colorado River canyon, the dropping reservoir level will perch this boat ramp high and dry. During the spring snowmelt, Powell Reservoir levels rose a mere 11 feet and the reservoir has now returned to the levels of the previous winter, about 90 feet down from full-pool. With no drought relief in sight, this continuing trend will eventually place power generation at risk. The minimum storage level to safely produce electricity is set at 6 million acre-feet. Currently the reservoir is at 50% of capacity storing 12.7 million acre-feet of water. Power generation at Glen Canyon Dam could effectively end in two or three years under present drought conditions. "This drought emphasizes the dubious nature of Lake Powell reservoir. By decommissioning Glen Canyon Dam we could restore five hundred miles of river to its natural habitat, which includes Grand Canyon National Park, while at the same time saving the water that is otherwise lost to evaporation" observes Weisheit.

LR in the News 08/28/03

Hite Marina closure leaves Cataract Canyon outfitters high and dry

Times Independent

Moab, Utah

by Lisa Taylor, contributing writer

The end of a Cataract Canyon river trip usually involves motoring or rowing for miles from where Lake Powell effectively absorbs the Colorado River's current to the small marina at Hite. This year, with the lake receding to record lows, some commercial trips are having to motor right on to Hall's Crossing or Bullfrog, 45 miles to the south.

Lake Powell is currently about 100 feet below "full", and is expected to drop another 12 feet by next spring. Dropping water levels and rising sediment have acted as pincers, squeezing away the usable access at the marina on Hite's eastern shore. In July, concessionaire ARAMARK got approval from the National Park Service to move its floating facilities down-lake, and in mid-August towed them completely clear of the area. The facilities include a floating store, fuel docks, water and septic lines, boat rentals, and courtesy docks. Hite's land-based store, gas, water and sewer services are still open.

Commercial and private boaters can use an "at your own risk" launch area, but as water levels continue to drop, the primitive ramp is barely usable, and at least one outfitter, Sheri Griffith River Expeditions, has opted to continue to Hall's Crossing, another 11 hours farther if the weather cooperates.

Tag-a-Long Expeditions president Bob Jones is frustrated that the Park Service didn't heed outfitter warnings about the marina going dry. "They should have been ready, because we met with them in March and outlined almost to the day when they'd have to find a solution. I'm discouraged they're not responding to the public."

Until the Park Service officially deals with the problem, Jones is improvising. "We've opened up another road [the NPS] allowed to the old marina site on the east side,

where the water is pretty close. We've simply taken down our Snow-cat, to take people and boats across that dry mud." The dry mud he's referring to is a 150-yard-wide band of compacted silt, webbed with cracks up to two inches across and two feet deep. Vehicles and pedestrians would have trouble with it on a dry day – if it rains, forget it.

Jones says the access he's using won't work for everyone, but argues that it wouldn't cost much to upgrade it, and with the Colorado River's original channel closest to the west side, "we're where the water will always be." Tag-a-Long has about 12 more trips this season, and Jones isn't interested in bypassing Hite. "The alternative – to go to Bullfrog – is 12 to 14 hours of motoring on a calm day, but if you get into wind and waves, rafts don't go like hard-hull boats, they go all over the place."

As to the environmental impact of restoring river access on the western shore, Jones points out, "We're talking about moving silt that's not supposed to be there anyway. Any environmental assessment will tell you to get rid of it."

An ARAMARK/Park Service sediment survey done in 2000 showed that the Colorado River delta, effectively the "top" of the lake, had crept four miles downstream in four years, and was about 11 miles north of Hite.

The survey allowed the marina 35 years of use provided the reservoir held steady at 3,700 feet, an "incredibly optimistic" projection according to John Weisheit, conservation director of environmental group Living Rivers. "Considering the downstream demand for water, the present drought situation, and how the river erodes into the exposed sediment and feeds the delta, the facilities at Hite are basically history."

Even Jones, with a vested interest in Hite's recovery, guesses it will take at least five years to restore the facilities, provided there's a break in the drought and the reservoir can recharge. In the meantime, a 2003 NPS/ARAMARK survey showed the delta had already crept past Hite, and new dock and pumping-station closures pop up on the official Glen Canyon National Recreation Area website every week. Lake Powell businesses are insistent that there are still unlimited activities on the water – the trouble for the foreseeable future is how to get out there.

LR Press Release 08/28/03

Drought could cause Lake Powell Reservoir to drop as low as 39% next year

For immediate release
August 27, 2003

Contact: John Weisheit (435) 259-1063

Drought could cause Lake Powell Reservoir to drop as low as 39% next year.

Recreation access to be cut substantially.

Federal forecasts for the operation of major dams in the Colorado River system indicate that if drought conditions continue as anticipated, Lake Powell could see another significant drop to as low as 39 percent over the next 12 months. System-wide storage could drop from 57 to 48 percent as water users in the basin continue to use water at pre-drought rates.

Using data from the past 30 years, the Bureau of Reclamation's (BuRec) "2004 Draft Annual Operating Plan" forecasts a range of inflow scenarios for Lake Powell reservoir from 3.8 to 15.6 million acre feet. This would equate to a range of reservoir levels from 39 to 83 percent.

The lower level would represent a near repeat of 2002, when flows into Lake Powell reservoir were 75 percent below normal. Normal flows as estimated by BuRec are approximately 12 million acre-feet. The upper level would represent flows not seen since 1997.

"As federal scientists continue to forecast that drought conditions will last several decades, water managers and the public should not count on any high flows," says John Weishiet, Conservation Director for Living Rivers. "During the drought of 1942 to 1977, flows were off by 19% percent. Taking into account increased diversions above Lake Powell reservoir since that time, which now are approximately 4.7 million acre-feet per year, it's easy to see why Lake Powell continues to drop."

Over the past four years, inflows into Lake Powell have averaged just 50 percent of normal: 62, 59, 25 and 54 percent respectively from 2000 to 2003. Even last year's forecasted El Niño conditions, which generally result in well above average precipitation, yielded a snowpack of just 84 percent of normal. Due to the significantly dry soil conditions from three straight years of well below average precipitation, Lake Powell received just 54 percent of its average inflow of 12 million acre-feet.

Simulating a significant drought event, as the region is now experiencing, the American Water Resources Association estimated that it could take just eight years of drought for Lake Powell reservoir to be emptied of its store of water. "They're right. It's been four years, and we're half way there," adds Weisheit.

Presently, Lake Powell reservoir is reported to be at 51 percent capacity, down from 59 percent last year and 95 percent at the beginning of 2000. The actual amount of available water is 50 percent, as BuRec is not compensating for 500,000 acre-feet of storage lost to sediment since its last sediment inventory was conducted in 1986.

When full, Lake Powell reservoir can store 24.3 million acre-feet. An acre-foot of water represents 326,000 gallons, or enough for two urban families per year.

If inflows into Lake Powell reservoir continue to average 50 percent of normal, or about six million acre-feet per year, this would result in the reservoir level dropping an additional eight percent next year, to 10.7 million acre-feet, or 44 percent of capacity.

This would bring the reservoir elevation down 140 feet from full. Only two of the reservoirs six marinas would be operational. Commercial and private Colorado River

rafting trips, which normally end at Lake Powell reservoir, would have no way to get off the reservoir, short of rowing or motoring their rafts more than fifty miles to the nearest functioning marina.

"This is a multi-million dollar industry that we are about to lose," adds Weisheit. "First they killed the rafting industry through Glen Canyon when they built Glen Canyon Dam, and now they're stopping us from running the rivers upstream too."

In addition to Lake Powell dropping eight percent, the systems other major reservoir, Lake Mead, will also drop. In water year 2003 (October 2002-September 2003) Lake Mead will have dropped from 66 to 60 percent. 2004 will see a repeat of this six percent reduction. Lake Mead's primary input comes from releases from Glen Canyon Dam which are only 8.2 million acre-feet per year. Hoover Dam is scheduled to discharge 9.4 million acre-feet for its users downstream, which combined with evaporation and reservoir withdrawals will draw the reservoir down to 54 percent of capacity next year.

GLEN CANYON DAM UPDATE

Operations

Releases from Glen Canyon Dam will be lower in September than August. Releases in August averaged about 14,600 cubic feet per second (cfs) with a total of 900,000 acre-feet released. In September, releases will average 8,000 cfs with a total of 476,000 acre-feet scheduled to be released. On Mondays through Saturdays (except for Labor Day) in September, daily fluctuations due to load following will likely vary between a low of 5,000 cfs (during late evening and early morning off-peak hours) to a high of 10,000 cfs (during late afternoon and early evening on-peak hours). On Sundays (and on Labor Day), releases will be 5,000 cfs from 7 pm until 7 am, and 8,000 cfs from 7 am until 7 pm.

Releases from Glen Canyon Dam in October and November of 2003 are currently scheduled be 492,000 acre-feet and 476,000 acre-feet respectively, with the same load following pattern as September.

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2003 are being scheduled to meet the minimum objective release of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Basin Hydrology

Drought in the Colorado River basin continues. Inflow volumes have been substantially below average this year with water year 2003 being the 4th consecutive year with below average inflow to Lake Powell. April through July unregulated inflow to Lake Powell in 2003 was 3.91 million acre-feet, only 49 percent of the 30 year average. Total unregulated inflow for water year 2003 will likely be about 51 percent of average.

Snow accumulations in water year 2003 were again well below average levels. Additionally, what snowpack there was in the Upper Colorado River basin this year melted earlier than normal, with the runoff for the most part, being completed by late June. This has resulted in very low summer flows. Inflow to Lake Powell in July tallied up to only 350,000 acre-feet or 22 percent of average. Summer thunderstorms can help augment river flows in the summer, but thus far there has been only limited monsoonal precipitation in the Upper Colorado River basin. Unregulated inflow to Lake Powell in August will likely be only 24 percent of average. Inflow to Lake Powell on August 28, 2003 was 4,800 cfs, 50 percent of what is usually seen in late August.

Total unregulated inflow into Lake Powell in water years 2000 and 2001 was 62 and 59 percent of average, respectively, and only 25 percent of average in 2002. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963. These low inflows have reduced water storage in Lake Powell. Lake Powell reached a low water surface elevation this spring at 3605 feet (95 feet from full pool) on May 1, 2003. The lake then rose in response to snowmelt-runoff, reaching a peak on June 23, 2003 at 3616.6 feet. The current elevation of Lake Powell is 3,604.8 feet (95.2 feet from full pool). Current storage is approximately 12.2 million acre-feet (50 percent of capacity). The water surface elevation at Lake Powell will likely continue to decrease for the remainder of the year. Under expected inflows, Lake Powell will likely be near elevation 3600 feet on January 1, 2004.

This release courtesy Tom Ryan.

Living Rivers Currents 09/01/03

Water 2025: A Crisis in the Making

Throughout the summer the Department of Interior, through the Bureau of Reclamation (BuRec), has been orchestrating another of its legendary public relations charades. At a time when most Western states are experiencing major problems with water allocation, BuRec is responding with a long-term management plan which completely ignores the problem. It is dubbed "Water 2025: Preventing Crises and Conflict in the West," and is

little more than a repackaging of existing management strategies combined with a heightened push for desalinization technology. It contains no proposals for how to substantively address major water shortages, such as those already manifesting in the Colorado River watershed.

"Minor efficiency gains and conservation measures as Secretary Norton prescribes will bring about some savings, but these are merely drops in the bucket given that the Colorado River is providing barely half the water the Department of Interior is contracted to deliver," says Owen Lammers, executive director of Living Rivers.

Abundant historical evidence reveals that the present drought in the Colorado watershed is far from unprecedented, and warnings from the United States Geological Survey one year ago urged water managers to be prepared for several decades of below average precipitation. Lammers notes, "Water 2025 demonstrates that the Department of Interior is ignoring this responsibility."

- * The Plan emphasizes Interior's long-standing tradition of acquiescing to the states for resolving disputes. However, as 80 years of conflict reveals, cooperation is rare, even in the best of times.

- * The Plan's market-driven water banks and transfers from farmers to municipalities during times of shortages are laudable on a small scale, but there is no discussion of what will happen when the real shortages occur. Certainly, the 25 million people reliant on Colorado River water will not be deprived, but what will it cost? Farmers are becoming increasingly reluctant to make water transfers. Without strict federal guidelines and policies, municipalities like Los Angeles, Phoenix, Las Vegas and Salt Lake City will be forced into a cost environment not unlike what California energy utilities faced three years ago.

- * Crop substitutions, which represent the greatest opportunities for water savings, are completely ignored by the Plan. Nearly half of Colorado River water is used to grow water-intensive alfalfa and other forms of cattle feed. Much of this water could be saved by growing crops for human consumption.

- * The Plan advocates maintaining and enhancing existing infrastructure. However, much of this infrastructure is responsible for the loss of up to 20 percent of the Colorado River's flow due to evaporation and seepage amongst its reservoirs, but there are no capital improvements planned to reduce these losses.

Not until the 25-page report's last 100 words does the term "drought" receive much attention. This should be Interior's main focus at this time. Areas that Interior should be addressing include: outlining specific solutions for federal management to employ; how farmers will be enticed or forced to release their water to preserve municipal economies;

and how Interior will enforce necessary conservation strategies and efficiency standards.

"This report is all about carrots with no federal stick," adds Lammers. "Interior must begin developing water use standards and practices, as well as allocation strategies to be implemented as this drought situation worsens. Absent this, crises is inevitable, despite Secretary Norton's report and marketing strategy titled to prevent it."

Riverkeeper: On the Yampa, Green and Grand Canyon

From June 2-6, Living Rivers' Colorado Riverkeeper program, in conjunction with Holiday River Expeditions, honored the 50th Anniversary of the first Yampa/Green river trip organized to stop the inundation of Dinosaur National Monument from Echo Park Dam. It's purpose included drawing attention to the slow death of Dinosaur National Monument's river corridor due to the operations of Flaming Gorge Dam upstream. This month the Riverkeeper program will return to the Green River. It will spend nine days in Desolation Canyon, the most remote wilderness- quality river corridor in the continental United States. Like those in Dinosaur National Monument, native fish in this stretch suffer from the impacts of Flaming Gorge Dam. This critical habitat is being ignored by federal researchers developing re-operation plans for the dam.

In October the program will undertake a 12-day science trip down the Colorado River through Grand Canyon National Park. Participants will assist researchers from Northern Arizona University in collecting data to evaluate how the food base of Grand Canyon's

river ecosystem has changed due to the operation of Glen Canyon Dam. Federal scientists are considering ceasing financial support for such research, despite its vital role in understanding the steps needed to recover endangered fish species in the Grand Canyon National Park.

Living Rivers Currents 09/01/03

Powell Reservoir: Draining Recreation

The reservoir-draining drought is again revealing canyon walls not seen in 30 years. For example, the National Parks Service's marina facilities at Antelope Point near Glen Canyon Dam will be perched on a cliff's edge this Autumn.

The situation at Hite Marina at the top of Lake Powell reservoir is already disastrous, where a vanishing reservoir has exposed a sediment plug that backs up the Colorado River Arm for 30 miles. Because of the thick, gooey mud, the Hite concessions operator, ARAMARK, has literally pulled anchor and moved their floating docks 50 miles downstream to the marina at Hall's Crossing. Hite Marina is looking like a ghost town of thick mats of non-native weeds and obnoxious tamarisk trees.

Colorado River runners who previously finished their trips at Hite, now have no place to exit. Thoughts of pushing rafts through a choppy reservoir 50 miles further to Bullfrog or Hall's Crossing marinas are not welcomed. Bullfrog's boat ramp is about to become unusable itself, and Hall's Crossing is too small to accommodate all of the visitors now that these other facilities are closing. In desperation, river outfitting companies are attempting to forge a road across the sediment themselves at a location across the reservoir from Hite.

In a letter to the superintendent at Glen Canyon National Recreational Area, Living Rivers has reminded the National Park Service that the money targeted for capital improvements at Hite Marina must immediately be shifted toward mitigating the impacts from sediment on the river running public, who typically have to endure the National Recreation Area's bias to the powerboat industry. In 2003, power boaters have received \$3 million dollars in boat ramp improvements, and river runners have received none.

Living Rivers Currents 09/01/03

LR Drought Watch: No Relief In Sight

Federal forecasts for the operation of major dams on the Colorado River indicate that if drought conditions continue, Lake Powell could see another significant drop to 39 percent in one year. Basin-wide storage could drop from 57 to 48 percent as water users continue to use water at pre-drought rates.

BuRec's "2004 Draft Annual Operating Plan" forecasts a range of inflow scenarios for Lake Powell reservoir from 3.8 to 15.6 million acre-feet. This would equate to a range of reservoir levels from 39 to 83 percent. The lower level would represent a near repeat of 2002, when flows into Powell reservoir were 75 percent below normal. Normal flows estimated by BuRec are approximately 12 million acre-feet, flows not seen since 1997.

"During the drought of 1942 to 1977, flows were off by 19 percent. Taking increased diversions above Lake Powell reservoir since that time, which are now approximately 4.7 million acre-feet per year, it's easy to see why Lake Powell continues to drop, " says John Weishiet, conservation director for Living Rivers.

Since year 2000, inflows into Lake Powell have averaged just 50 percent of normal: 62, 59, 25 and 54 percent respectively. Presently, Lake Powell reservoir is reported to be at 51 percent capacity, down last year from 59 percent. The actual amount of available water is 50 percent, as BuRec is not compensating for .5 million acre-feet of storage lost to sediment since its last inventory was conducted in 1986.

If inflows into Lake Powell reservoir continue to average 50 percent of normal, or about six million acre-feet per year, this would result in the reservoir level dropping an additional eight percent to 10.7 million acre-feet, or 44 percent of capacity. This would bring the reservoir elevation down 140 feet from full. Only two of the reservoirs six marinas would be operational. Commercial and private Colorado River rafting trips, which normally end at Lake Powell reservoir, would have no way to get off the reservoir, short of rowing or motoring their rafts to the nearest functioning marina.

"This is a multi-million dollar industry that we are about to lose," adds Weisheit. "First the Bureau of Reclamation killed the rafting industry through Glen Canyon when they built Glen Canyon Dam, and now they're stopping us from running the rivers upstream too."

Living Rivers Currents 09/01/03

Glen Canyon Dam: LR Demands Supplemental EIS

In a letter submitted this month to Michael Gabaldon, chair of the Adaptive Management Program (AMP) for Glen Canyon Dam, Living Rivers outlined the justification for the Department of Interior initiating a new Environmental Impact Statement (EIS) for Glen Canyon Dam. This would would compel the federal government to examine decommissioning Glen Canyon Dam as a means of recovering endangered species habitat lost in Grand Canyon National Park as a result of the dam's operations.

Completed in 1996, the existing EIS for Glen Canyon Dam prescribed a set of operational criteria for the dam in an effort to halt the Bureau of Reclamation's violation of the Endangered Species Act in Grand Canyon. So far, all these efforts have failed.

- * The decline of the Humpback Chub population from 8,000 to 2,000 fish, and the inability to establish a second location in the river corridor for Humpback Chub to live.

- * The inability to provide enough sediment for the preservation of beach habitat. The number and size of beaches in the Grand Canyon have experienced a significant decline since the AMP began. This negatively effected the Canyon's recreational experience, but has also impacted the river corridor's cultural resources, which are now prone to erosion.

- * Unanticipated impacts resulting from reduced elevations of Glen Canyon Reservoir, such as increased temperatures and modified nutrient dynamics, could have significant effects on the downstream resources in the Grand Canyon. As the drought situation persists, these effects will become more pronounced.

The key to reinstating National Environmental Policy Act compliance, through a supplemental EIS, is if new data or impacts are recognized. Clearly in the case of Glen Canyon Dam, significant new data (biological and sediment) indicate that the system needs re-evaluation.

Living Rivers Currents 09/01/03

Delta Deficit: Wasting Money and Habitat

Congress is about to fund the start-up of a defunct desalting plant on the Colorado River near Yuma, Arizona, dooming critical habitat in the delta region. The Bureau of Reclamation (BuRec), which has recommended that Congress authorize the desalter's repair, is downplaying the results of its own analysis, which reveals far less costly and less environmentally damaging measures to meet US treaty obligations for water delivery to Mexico.

"This is reminiscent of BuRec of the past," says Lisa Force, Living Rivers program director. "At a time when federal deficits are the largest in U.S. history, it's unbelievable that Congress would consider throwing away taxpayers' dollars to prop up this boondoggle." "There are cheaper and less destructive ways to save Colorado River water than running the Yuma Desalting Plant," added Myra Wilensky, regional organizer at the National Wildlife Federation.

BuRec's objective is to produce about 108,000 acre-feet of water from the plant of sufficient quality to help meet its 1.5 million acre-feet annual obligation to Mexico. Taxpayers will be required to pay \$26 million to replace obsolete technology-plus a minimum of \$36 million in annual operating costs for the plant.

Completed in 1992 at a cost of \$256 million (a five-fold increase in projected construction costs) to clean up brackish wastewater from farms in southern Arizona, the plant was shut down several months later due to extremely high operating costs.

Another option ignored by BuRec for the 108,000 acre-feet involves paying willing sellers to lease water they presently do not need, at just 15 percent the cost of starting the Yuma plant. "The Department of the Interior has already proposed an alternative that could save \$30 million every year. Not only does Interior's alternative have great economic advantages, it will also save enough electricity to supply 25,000 people," says Jennifer Pitt of Environmental Defense.

International water expert and director of the Pacific Institute in Oakland, Dr. Peter Gleick, said "Despite the Department of Interior's much ballyhooed 'Water 2025 Plan' claiming a new era in western water management, the decision to reopen the expensive and environmentally damaging Yuma desalter shows that federal water policy is really business as usual - spending taxpayer money for unsustainable water projects."

The agricultural wastewater that the plant would process now flows into the Cienega de Santa Clara, a 40,000-acre open water ecosystem in the Colorado River delta region. The desalting plant would remove this flow from the Cienega and return only highly saline brine to the wetlands.

"This provision would destroy an extremely important wetland in Mexico that contains the largest remaining breeding population of Yuma Clapper Rail in the world," says Bill Snape, Chief Counsel for Defenders of Wildlife.

"It will be impossible to replace the value of the Cienega de Santa Clara to the Colorado River ecosystem."

The Cienega is the largest remaining wetland in the Southwest and is home to 56 threatened, endangered and declining species. Several scientific studies funded by the Department of Interior confirm that the wetland would be completely destroyed by desalter operations.

MOTOR RIG STRANDED IN UNKAR RAPID

Grand Canyon National Park

A Wilderness River Expeditions 36 foot motorized tour boat ran aground in Unkar Rapid on the Colorado River in Grand Canyon Thursday afternoon. The boat was part of a two-boat trip of 41 people. National Park Service technical rescue personnel used a helicopter to short-haul 6 people off the stranded raft late yesterday afternoon. This type of rescue involves lifting two people at a time off the boat by a 100-foot line from the

helicopter. Rescue personnel acknowledge this is the most dangerous type of rescue the park performs. Darkness halted the rescue operation of the remaining boat occupants around 7:00PM. The remaining passengers spent last night on the boat. The short-haul operation resumed this morning.

The river trip was scheduled to exchange passengers at Phantom Ranch before noon today. Concessions passengers hiking into the canyon to join the river trip are being told they can expect the arrival of the boats late this afternoon.

Flows from Glen Canyon Dam have been between 5,000 and 8,000 cubic feet per second. This flow is considered very low for motorized tour boat travel through the park. During low water flows in 2000, the NPS conducted 3 short-haul operations for motorized tour boats stranded in the rivers rapids. Drought conditions in the Colorado River Basin continue, with Powell Reservoir above Glen Canyon Dam at 50% capacity.

It's been a busy period over the last 30 days for National Park Rescue teams responding to commercial river trip calls for evacuations. There have been two rescues of passengers with broken arms, a number of rescues of passengers with Norwalk Virus-like gastrointestinal distress, and one passenger sustained a de-gloving injury to his hand when he caught his wedding ring on boat rigging as he jumped off the boat into the river.

RRFW Riverwire - USFS TO TRASH WILDERNESS ON MIDDLE FORK

The Salmon Challis National Forest has released a Finalized Environmental Impact Statement (FEIS) which proposes to reduce the number of days that parties can remain on the Middle Fork of the Salmon river. The idea is to reduce the impacts of boaters on the river corridor, while at the same time the analysis would allow for an increase in jetboat numbers on the wilderness mainstem Salmon River.

The boiled down synthesis goes something like this: Public parties of 21-24 members, and commercial parties of 21-30 customers, would be limited to a maximum of 6 days on the river. Parties (both commercial and public) of 11 -20 members would be limited to 7 days on the river. Only those groups of 10 or less would be allowed to remain on the river for the current use limit of 8 days.

Lloyd Knapp, with North West Rafters Association, notes that most commercial trips don't stay on the river for 8 days due to quick turnaround times. This new ruling will not affect commercial outfitters, but it will fall onto the backs of self-outfitted recreational boaters, who typically take longer trips through the area. While the intent of the plan is to reduce the wear and tear on the Frank Church River of No Return Wilderness, Lloyd notes that in doing quick-turnarounds, the commercial outfitters are pouring more people down the river than trips that moving at a slower pace. Knapp notes "I would say that the river is not over-used. It does get a lot of use, but the Summer float season is relatively short. It's not at all like the Gauley in West Virginia, or other rivers that are loved to death."

Knapp also points out that the river also raises a substantial fortune in the contested Recreation Fee Demonstration program. "There is no evidence that the Forest Service has spent a dime of this money on the river. If there is over use in certain areas, then the Fee Demo money should be used for repairs and maintenance."

Jo Johnson, co-director of River Runners For Wilderness, notes there are clear flaws in this management plan. "Increasing motorized use and speeding up river travel through the wilderness do nothing to promote wilderness character. This plan continues the now outdated concept of allocating river use between the public and a small oligopoly of middlemen. This model has outlived its usefulness, especially in light of a continued growth in public rafting and ongoing declines in demand for guided river running services."

The FEIS has been issued, and the deadline for comments is October 27, 2003. A summary version of the FEIS is available at the website below. This is a Forest Service publication known as Frankly Speaking (a reference to Frank Church).

www.fs.fed.us/r4/sc/recreation/fcronr.htm

Your comments strongly opposing this plan are needed. Quite simply, there is very little justification for this type of wilderness river use. It's discriminatory against public river users, and doesn't do anything about the commercial interests, who carry very large groups of people quickly through while putting most of the use on the wilderness.

PARK AIRLIFTS 17 PEOPLE OFF STUCK RAFT

By Brad Fuqua Editor, Grand Canyon News

A 37-foot motorized raft, operated by Wilderness River Adventures, became pinned on a rock at Unkar Rapid September 11, 2003. Unkar Rapid is at river mile 72.5. "At approximately 2 p.m., the motorized raft experienced engine failure upon entering the rapid," incident commander K.J. Glover said in a report. "It traveled to the left side and got lodged on rocks towards the base of the rapid." For the next three hours, the boatman and crews from two other Wilderness River Adventures' boats attempted to

free the raft. The NPS received a satellite call for assistance at 5 p.m., after the self-rescue attempts failed. But SAR [search and rescue] personnel had less than two hours of daylight left for the operation.

Two rangers were inserted onto the boat via short-haul, a technique of moving rescuers utilizing a 100-foot rope attached to the helicopter. Six passengers were evacuated before nightfall, but air operations had to be suspended at dusk due to safety protocols. "Rangers stayed on the boat with the remaining passengers throughout the night," Glover reported. "In the morning the passengers were short-hauled to safety." There were no reports of injuries. Some of the 17 were able to get onto other river trips and hike out from Phantom Ranch.

Following the helicopter operation, rescuers and boatmen remained on the raft to assist with efforts to free it from the rock. Attempts to free the boat Friday proved unsuccessful. However, the boat was moved with a "Z rig" from the initial point of entrapment to a location 10 feet downstream. The boat also rotated 180 degrees. On Saturday morning, park rangers returned to Unkar Rapid to assist with freeing the boat. The raft finally broke free utilizing engine power. The boat then continued down river without further incident.

A photo of the stranded boat is at <http://www.grandcanyontourguide.com/> click on "Grand Canyon Newspaper".

GRAND CANYON SLIDESHOW TOUR

Tom Martin, Co-Director of River Runners for Wilderness, will be presenting a slideshow on the Colorado River Management Plan and on his book Day Hikes from the River: A Guide to 100 Hikes from Camps on the Colorado River in Grand Canyon National Park. The CRMP-Hikes slideshow will be shown in Grand Junction, Boulder, Denver, Fort Collins and Colorado Springs, Colorado. See beautiful vistas illustrating Grand Canyon hikes you can do from the river and exciting river running shots. Tom will cover the latest news on the controversial Colorado River Management Plan now in progress for Grand Canyon National Park, and how this plan will affect your boating access. Tom will be signing books, the sale of which will benefit River Runners for Wilderness. Round up your boating buddies, and catch one of these free shows:

Grand Junction Wednesday, October 8th, 7PM - 9PM White Water West 418 South 7th St Hosted by W.A.T.E.R.

Boulder Thursday, October 9th, 7PM - 9PM The Dairy Center 2590 Walnut St. Plenty of free parking in Dairy Center's Walnut St lot

Ft. Collins Tuesday, October 14th, 7PM - 9PM REI 4025 S. College Ave. Hosted by REI

Denver Downtown Wednesday, October 15th, 7PM - 9PM AAA Inflatables 3264 Larimer St. Hosted by High Country River Rafters

Colorado Springs Thursday, October 16th, 7PM - 9PM Sports Page 965 Summer Games Dr. Hosted by Pikes Peak River Rafters

All shows are free and open to the public. For more information or for scheduling a show in your area, contact Jo Johnson at jojohnson@rrfw.org or 303-443-1806.

River News 10/01/03

GLEN CANYON DAM UPDATE

Operations

Releases from Glen Canyon Dam will be nearly identical in October to what they were in September. In October, releases will average 8,000 cfs with a total of 492,000 acre-feet scheduled to be released. On Mondays through Saturdays in October, daily fluctuations due to load following will likely vary between a low of 5,000 cfs (during late evening and early morning off-peak hours) to a high of 10,000 cfs (during late afternoon and early evening on-peak hours). On Sundays, releases will be 5,000 cfs from 7 pm until 7 am, and 8,000 cfs from 7 am until 7 pm.

Releases from Glen Canyon Dam in November of 2003 are currently scheduled be 476,000 acre-feet (an average releases of 8,000 cfs), with the same load following pattern as October.

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2003 were scheduled to meet the minimum objective release of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Basin Hydrology

Drought in the Colorado River basin continues. Inflow volumes have been substantially below average this year with water year 2003 being the 4th consecutive year with below average inflow to Lake Powell. April through July unregulated inflow to Lake Powell in 2003 was 3.91 million acre-feet, only 49 percent of the 30 year average. Total unregulated inflow for water year 2003 will be 53 percent of average.

Inflow into Lake Powell picked up somewhat in September, 2003. Significant amounts of precipitation fell in the Colorado River Basin, particularly in the Four Corners region, in the first two weeks of September. Unfortunately, a drying trend followed. There has been almost no precipitation in the Colorado River Basin in the latter part of September. Total unregulated inflow in September will end up at about 453,000 acre-feet, or 95 percent of average. Inflow on September 29, 2003 was 5,600 cfs, about 60 percent of what is usually seen in late September.

Total unregulated inflow into Lake Powell in water years 2000 and 2001 was 62 and 59 percent of average, respectively, and only 25 percent of average in 2002. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963. These low inflows have reduced water storage in Lake Powell. Lake Powell reached a

peak elevation in 2003 on June 23 at 3616.6 feet. The current elevation of Lake Powell is 3,603.8 feet (96.2 feet from full pool). Current storage is approximately 12.1 million acre-feet (50 percent of capacity). The water surface elevation at Lake Powell will likely continue to decrease for the remainder of the year. Under expected inflows, Lake Powell will likely be near elevation 3600 feet on January 1, 2004.

Experimental Flows

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, were completed on March 31, 2003. From January through March 2003 releases ranged between a high of 20,000 cfs to a low of 5,000 cfs each day. These same high fluctuating releases are scheduled to be repeated in January through March of 2004.

The January through March high fluctuating releases were intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub.

The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address the decline of two key resources in the Grand Canyon: sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.uc.usbr.gov/amp/flow_fonsi.pdf.

COLORADO RIVER ECOSYSTEM SYMPOSIUM

The Glen Canyon Dam Adaptive Management Program and the Grand Canyon Monitoring and Research Center will be hosting a symposium on the Colorado River in Grand Canyon. The symposium will be held in Tucson Arizona, October 28-30, 2003, and is open to all interested persons (public and students welcome!). The symposium will address questions such as:

Was the Low Steady Summer Flow in 2000 good for the river? How can conditions for the endangered humpback chub be improved? Are the new flows and experimental removal of non-native fish working? What is the role of experimentation under the Record of Decision?

Registration is free, but please register your attendance online using the website link below so organizers have enough meeting materials and light refreshments available. The program will run from approximately 8:30 a.m. to 5 p.m. each day, with a special poster session the evening of October 28th.

The program and flyer are available at <http://www.gcmrc.gov/symposium/2003/symposium.html> The Symposium will be held at the Sheraton Tucson Hotel and Suites, 5151 E. Grant Road, Tucson, AZ 85712. For further information, contact Serena Mankiller, USGS/BRD, Southwest Biological Science Center, Grand Canyon Monitoring and Research Center, 2255 N. Gemini Dr., Flagstaff, AZ 86001, Ph: 928/556-7094, E-mail: smankiller@usgs.gov

BOULDER, GRAND JUNCTION SLIDESHOW REMINDER

Grand Canyon enthusiasts in Boulder and Grand Junction, Colorado: Don't forget the free upcoming Day Hikes from the River slideshow and CRMP update this week at the following locations.

Grand Junction Wednesday, October 8th, 7PM - 9PM White Water West 418 South 7th St Hosted by W.A.T.E.R.

Boulder Thursday, October 9th, 7PM - 9PM The Dairy Center for the Arts 2590 Walnut St.

If you can't make it to one of those, you have more opportunities in Fort Collins, Denver and Colorado Springs.

Fort Collins Tuesday, October 14th, 7PM - 9PM REI 4025 S. College Ave. Hosted by REI

Denver Downtown Wednesday, October 15th, 7PM - 9PM AAA Inflatables 3264 Larimer St. Hosted by High Country River Rafters

Colorado Springs Thursday, October 16th, 7PM - 9PM Sports Page 965 Summer Games Dr. Hosted by Pikes Peak River Rafters

Additional shows are tentatively scheduled in Colorado for Salida, December 2nd and Durango, December 4th, and in Salt Lake City. For more information on any of the shows, contact jojohnson@rrfw.org or at 303-443-1806.

RIVER RUNNERS WANT LARGER SHARE OF CANYON

By Chris Barge, Boulder Daily Camera Staff Writer

So let's say you're a hard-core paddler who wants to lead your own trip down the Colorado River through the Grand Canyon. Now, pretend you want to do that some time in the next decade. Good luck. Under the current wait-list system, you'd have to buy a Day Planner for the year 2023 before finding a page to pencil in a trip. The wait list for recreational paddlers is about 20 years long. If you want to go this year, cash in those stocks: A spot is waiting for you on a commercial trip with one of the many outfitters that share 68 percent of the trip allocations. A woman from Boulder and a man who spends most of his time near the Grand Canyon are trying to rally the public behind a movement to change the status quo.

Jo Johnson of Boulder and guide book author Tom Martin co-founded River Runners for Wilderness one year ago. Martin will present a slide show tonight to promote their organization and his updated guidebook, "Day Hikes from the River: 100 Hikes from Camps on the Colorado River in Grand Canyon National Park." The book, an expanded version of his first guide, points out fun side hikes from the river for the 32 percent of river runners who are going it on their own. He says he hopes the book warms people to the idea of joining his and Johnson's cause.

Together, Johnson and Martin are trying to get the public engaged as the National Park Service develops a new Colorado River Management Plan. "There has been 30 years of stagnation down there to the benefit of an oligopoly of concessionaires," Martin said. "Fixed allocations don't work." The Park Service is scheduled to publish a draft environmental impact statement for the plan this fall. It will address the allocation system, as well as whether to continue allowing motorized boats on the river.

Commercial outfits in the canyon like using motor boats because they allow them to offer customers longer river trips over fewer days. Johnson says, in addition to being expensive, fast trips rob visitors of the true immersive psychological experience that the Grand Canyon can provide.

Hooey, says Mark Grisham, executive director of the Grand Canyon River Outfitters Association, which represents the concessionaires. Go to Minneapolis or Dallas and fill an auditorium with people who would seriously consider taking a river trip through the Grand Canyon, he said. Then, ask for a show of hands to these questions: Who wants to book an outfitter for a one- to two-week trip? Now, who wants to round up their own gear, own group and all the time off necessary to do the trip on their own? "We don't think that show of hands would be 50-50," Grisham said. "We think it would be more like 95-five."

Grisham said he and Martin disagree on how many commercial boats should run the river. It's the right mix, Grisham said. It's the antiquated wait-list system that needs to change. He suggests introducing a lottery. Both sides agree that the current method for private boaters to get on the water needs improvement. "That's why people are so pissed off," Grisham said. "They feel like the Park Service has let them down, so we become the for-profit bad guys."

The Grand Canyon River slide show and park plan update will be from 7 to 9 p.m. today at the Dairy Center, 2590 Walnut St., Boulder. For more information, call Johnson at

(303) 443-1806. Martin's book is available at www.vishnutemplepress.com. For more information on the Colorado River Management Plan, visit www.nps.gov/grca/crmp/. Contact Chris Barge at (303) 473-1389 or bargec@dailycamera.com. Copyright 2003, The Daily Camera. All Rights Reserved.

River News 10/13/03

RRFW Riverwire – RIVER OF NO RETURN MANAGEMENT PLAN UPDATE

The final environmental impact statement (FEIS) has been released for the Frank Church River of No Return Wilderness Management Plan by the Salmon Challis National Forest. This plan will guide management of the Main and Middle Fork of the Salmon River for years to come. The wild character of this area has degraded significantly in the past 20 years and that trend will actually increase under the new plan. Please take a few minutes to write a letter to the Forest Service asking them to protect the wilderness character of the Frank Church - River of No Return Wilderness. Comments must be submitted by October 27, 2003.

The final plan allows unlimited expansion of aircraft and motorboat use, continued degradation around campsites, lakes, streams and trails, serious impairment of the opportunity for a wilderness experience on the Middle Fork Salmon and Main Salmon rivers, and an unfair quota system that has commercialized much of the access to these rivers. While the draft EIS included 11 alternatives for consideration, the final EIS has been reduced to a final five (A to E). Though none of these alternatives are optimal to preserve Wilderness character and values, Alternative B comes closest. We endorse Alternative B, but only with the following changes:

(1) Managing use on the Middle Fork and Main Salmon rivers: Alternative B is the only alternative that caps use at a level that protects Wilderness character and opportunities for a wilderness experience. However, because this alternative continues an outdated and unfair allocation system (60 percent of use is for commercial trips), and allows for overly large party sizes (19 per group) it unnecessarily limits the number of public boaters who can float these rivers. The Forest Service should cap river use at the level set in Alternative B, but increase the number of trips available to the public by reducing group size limits to 12 per trip, and by allocating a much larger percentage of the launches to the public, rather than commercial users. The opportunity to experience Wilderness should not be based on one's willingness to pay a commercial outfitter.

(a) Jetboats: The plan allows virtually unlimited motorboat use on the Mail Salmon. Jetboat use has grown dramatically since 1978, much of it for "jetback" shuttles, which bring rafters upriver to their cars. Urge the Forest Service to prohibit jetbacks, and to cap motorboat use at 1978 levels.

(b) Painter Bar Road: The Painter Bar road is a primitive route that was used to access a private inholding within the Wilderness and Wild Salmon River corridor. The Forest Service has acquired the inholding. The FEIS proposes to leave this road open to ATVs and 4-wheel drive traffic. The Wilderness Act prohibits permanent roads and the Wild

Scenic Rivers Act prohibits roads along Wild Rivers. Urge the FS to close the Painter Road in the final plan.

(2) Aircraft Use: The Forest Service estimates that 5,500 aircraft land on airstrips in the Wilderness each year. Most of the use is not for wilderness dependent activities but part of a new fad where pilots "bag" airstrips to prove their competence, or engage in an airplane version of car camping. All of the alternatives the Forest Service developed allow aircraft use to increase without restriction. Urge the Forest Service to limit the number of aircraft landings to pre-Wilderness designation levels, and to implement a permit system that allows access for legitimate Wilderness dependent activities only.

In addition, and without agency approval, pilots have converted four Wilderness meadows into landing strips, referred to as the Dewey Moore, Mile-Hi, Simonds, and Vines "landing strips". The Forest Service preferred alternative proposes to maintain these strips for "emergency use," though landing at other times would not be prohibited. Urge the Forest Service to permanently close the Dewey Moore, Mile-Hi, Simonds, and Vines landing strips.

(3) Backcountry: Urge the Forest Service to implement specific management strategies to reduce crowding and on-site physical impacts by reducing group size limits from the current 20 people/20 head of stock, to 10 people/10 head of stock.

(4) Outfitter Camps: The plan would continue the practice of reserving over 80 camps for commercial land-based outfitters. The camps include permanent structures such as corrals, tent logs and fences. All Wilderness users should be required to meet the same rigorous leave-no-trace standards. Urge the Forest Service to require that outfitter camps be temporary and removed at the end of each season.

(5) Livestock grazing, fire control, fish stocking: These three important ecological issues are not addressed in the plan despite the fact that each has a significant effect on natural conditions in the Wilderness. Urge the Forest Service to adopt standards that promote naturally functioning ecosystems. Natural fires should be allowed to burn, stocking non-native species should cease, and strict controls should be incorporated into livestock allotment plans.

Send your comments to: Ken Wotring, FC-RONR Wilderness Coordinator, Forest Supervisor's Office, Salmon-Challis National Forest, 50 Highway 93 South, Salmon, ID 83467. Phone: (208) 756-5131, Fax: (208) 756 - 5151, email: comments-intermtn-salmon-challis@fs.fed.us

RRFW Riverwire - Update on the CRMP Planning Process

To: All Interested Persons From: Planning Team Leader, Colorado River Management Plan

Subject: Update on the CRMP Planning Process Grand Canyon National Park is making considerable progress in developing a Draft Environmental Impact Statement for revising the park's Colorado River Management Plan (CRMP). We have developed a full range of reasonable draft alternatives (including the current situation which is the No Action alternative), which is now undergoing preliminary impacts analysis. The planning team has carefully considered and addressed input including the following:

- * Extensive comments the park received during the public scoping period in 2002,
- * Input from the stakeholder workshops and expert panels,
- * Consultation with Native American Tribes,
- * Interagency consultation,
- * Provisions of the 2002 lawsuit settlement agreement,
- * Extensive data and other information gathered by the planning team, and
- * Laws, policies, and principles guiding plan development (on the CRMP website at www.nps.gov/grca/crmp).

The next steps in the CRMP planning process will include:

- * Add mitigation measures to the alternatives, as necessary, to address any major impacts identified in the preliminary impacts analysis. The mitigated alternatives will then undergo additional impacts analysis. All of this is scheduled for completion in early November.
- * Review the draft alternatives and draft impacts analysis, make any necessary changes, and select a preferred alternative. The preferred alternative will be the agency's proposal for a revised CRMP; it may be one of the draft alternatives, the No Action alternative, or a new alternative developed during the preferred alternative selection process.
- * Publish a Draft CRMP/EIS for public review and comment (after any additional revisions and analysis).

We will not know the exact timing for publishing and public review of the Draft CRMP/EIS until the preferred alternative selection process has been completed. Once that process is completed, we will announce the schedule in a note to the CRMP email list, and on the CRMP website.

When the Draft CRMP/EIS is published, the park will issue a Notice of Availability in the Federal Register, a press release, and a note to everyone on the CRMP mailing list. We have begun planning for extensive public review opportunities, including public meetings, and we will keep you informed as we develop the details.

Please send any comments or questions concerning this note or the process to grca_crmp@nps.gov (please be sure to use an underscore to make grca_crmp). Thank you for your interest in Grand Canyon National Park and the Colorado River Management Plan. Rick Ernenwein CRMP Planning Team Leader.

NOROVIRUS UPDATE

River trip illnesses down from last year By Brad Fuqua, September 24, 2003 Grand Canyon News Editor

One year after a series of norovirus outbreaks on the Colorado River, things appeared to be pretty much back to normal this summer as river runners made their way through Grand Canyon. Last year, dozens of river trip passengers fell sick to the gastrointestinal illness, the same strain that ran rampant on cruise ships. This summer at Grand Canyon, only one trip reported three or more sick passengers. The infected trip launched from Lee's Ferry on Sept. 1 and a passenger became sick the following day. As a result, there is a theory that the person may have arrived for the trip already carrying the virus.

"The first person got sick on the 2nd, so our wildest guess is that it was brought in," said Michael McGinnis, Grand Canyon National Park river sub-district ranger. "The Coconino County Health Department actually has the toilets ... they took samples and are testing for norovirus. That's what they think it is, they don't know for sure." McGinnis said it appears 13 people got sick from the incident. Two people were flown out and taken to the hospital in an evacuation done above Crystal Rapid. Last year's problems with the illness were traced to discharges from Glen Canyon Dam's water-treatment plant. This year, McGinnis said "they did testing and did not find it," so that problem has seemingly been solved.

In addition, the National Park Service, commercial river runners and public boating groups met in a series of meetings to go over sanitation practices. Out of those meetings came a policy that private or commercial boating groups must report three or more illnesses immediately via satellite phone. That happened just the one time this year.

If fewer than three people become sick with contagious gastrointestinal illness on a river trip, the boaters are not required to report it until the end of the trip. That happened 12 times this summer, including one person who had to be flown out.

According to the Centers for Disease Control, symptoms of norovirus usually include nausea, vomiting, diarrhea and some stomach cramping. Sometimes people additionally have a low-grade fever, chills, headache, muscle aches and a general sense of tiredness. The illness begins suddenly is usually brief, with symptoms lasting only about one or two days, the CDC reports.

UPDATE ON CRMP PLANNING

Released October 21, 2003 To: All Interested Persons From: Planning Team Leader, Colorado River Management Plan Subject: Update on the CRMP Planning Process
Grand Canyon National Park is making considerable progress in developing a Draft Environmental Impact Statement for revising the park's Colorado River Management Plan (CRMP). We have developed a full range of reasonable draft alternatives (including the current situation which is the No Action alternative), which is now undergoing preliminary impacts analysis. The planning team has carefully considered and addressed input including the following:

- * Extensive comments the park received during the public scoping period in 2002,
- * Input from the stakeholder workshops and expert panels,
- * Consultation with Native American Tribes, * Interagency consultation,
- * Provisions of the 2002 lawsuit settlement agreement,
- * Extensive data and other information gathered by the planning team, and
- * Laws, policies, and principles guiding plan development (on the CRMP website at www.nps.gov/grca/crmp). The next steps in the CRMP planning process will include:
 - * Add mitigation measures to the alternatives, as necessary, to address any major impacts identified in the preliminary impacts analysis.

The mitigated alternatives will then undergo additional impacts analysis. All of this is scheduled for completion in early November.

- * Review the draft alternatives and draft impacts analysis, make any necessary changes, and select a preferred alternative. The preferred alternative will be the agency's proposal for a revised CRMP; it may be one of the draft alternatives, the No Action alternative, or a new alternative developed during the preferred alternative selection process.

* Publish a Draft CRMP/EIS for public review and comment (after any additional revisions and analysis).

We will not know the exact timing for publishing and public review of the Draft CRMP/EIS until the preferred alternative selection process has been completed. Once that process is completed, we will announce the schedule in a note to the CRMP email list, and on the CRMP website.

When the Draft CRMP/EIS is published, the park will issue a Notice of Availability in the Federal Register, a press release, and a note to everyone on the CRMP mailing list. We have begun planning for extensive public review opportunities, including public meetings, and we will keep you informed as we develop the details.

Please send any comments or questions concerning this note or the process to grca_crmp@nps.gov (please be sure to use an underscore to make grca_crmp).

Thank you for your interest in Grand Canyon National Park and the Colorado River Management Plan. Rick Ernenwein CRMP Planning Team Leader

River News 10/25/03

RIVER CONCESSION SALE POSSIBLE

Grand Canyon, AZ

A Grand Canyon river concessionaire has initiated the process of being purchased by another rafting concession, according to park officials. The river concession contract, owned by High Desert Adventures, has two years left on its present contract extension. The purchaser, if approved by the park, will be Arizona Raft Adventures. High Desert Adventures has 3,323 user days, while Arizona Raft Adventures has 10,368. There are currently 16 river concessions contracts today, with one company holding two contracts. If the sale is approved, there will be 16 contracts held by 14 companies. The contract period is now up to 10 years, with three-year extensions allowed beyond the 10-year period. All river concessions are presently operating under an extension that will expire December 31, 2005.

Grand Canyon National Park will be renewing the river concession contracts based on the Colorado River Management Plan (CRMP), now in the midst of an Environmental Impact Statement review. The final management plan will set the stage for river use for another 10 years.

Jo Johnson, River Runners For Wilderness Co-Director, is hoping for a change in the way the park distributes these permits. Johnson notes that 21 businesses become river concessionaires in the fall of 1971, with the initiation of 5-year contracts. At that time, all government agencies were to be following the National Environmental Policy Act, known as NEPA. Though federal law requires public review and scoping of such activities, these have never been conducted, and river concessions contracts have since been awarded based on requirements found in the CRMP. "Today, the split-allocation system has resulted in the do-it-yourself river running public waiting in a projected 20 year backlog of permits for river access while river concessionaires are slashing prices on river trips to assure their river trips fill." Johnson adds "We question the continued usefulness of a split allocation system."

According to Johnson, there are only two ways to shift user-days from the river concessions back to the public. The first is if the CRMP identifies a decreased need for commercial concessionaire services as they are presently offered. "The other way would be for the CRMP to adopt an allocation-free access system like the one at Boundary Waters or at Grand Canyon for backpackers. This completely eliminates the need for concessions to have a fixed allocation base." Johnson points out that de-regulating the concessions would move them from an oligopoly with fixed subsidies to an oligopoly "that could compete for market share. The park could terminate the concessionaire contracts and award any number of qualified Incidental Business Permits for guided river services."

"A number of businesses have been thriving for over a decade servicing the non-commercial river running public without any allocations whatsoever" Johnson noted. "These businesses provide a wide array of great services at low cost to the public. Allocation-free access plans hold the only hope for a contention free future for the river."

Interior Dept. favors more Canyon flooding

By Mitch Tobin ARIZONA DAILY STAR

Tucson, Arizona - Despite initial resistance, the Bush administration favors continued experimental floods meant to restore the Grand Canyon's ecology, a senior official said in Tucson on Tuesday.

Assistant Secretary of the Interior Bennett Raley, the administration's point man on water issues, spoke to 60 scientists at the start of a three-day meeting on how Glen Canyon Dam affects the Colorado River.

Researchers explained how they're using lasers, underwater cameras, century-old photos and experimental flumes in Minneapolis to learn how sand grains and Volkswagen-sized boulders move through the Canyon's rapids and eddies.

Raley urged the scientists not to politicize their work and to remember that "science is not the only input factor for management of the Colorado River."

"If scientists are sloppy and mix advocacy with science, you will end up with the same public perception of integrity that lawyers have," said Raley, a lawyer by training.

Glen Canyon Dam, completed in 1963, dramatically altered the Colorado's flow. Before the dam, the warm, muddy river roared with spring snowmelt. Sediment was lifted onto beaches and sand bars, creating wildlife habitat and backwaters vital to native fish, such as the endangered humpback chub. The beaches are still important campsites for boaters.

After the river was plugged to stabilize the Southwest's water supply, it ran colder and clearer below the dam, which trapped 90 percent of the silt. But dam releases--which often fluctuate with the Sunbelt's electricity demands--have also caused the Colorado's baseline flow to double downstream. As a result, much of the silt and gravel deposited by the Grand Canyon's 740 tributaries gets whisked into Lake Mead downstream.

"It wasn't that we just lost the spring floods, which redeposited sand," U.S. Geological Survey researcher Ted Melis said, "we lost the low-flows the rest of the time, which were low enough to retain those inputs for use during the high-flows. We're getting hit on both ends."

The result is an ecosystem transformed by a dam that helps supply water and power to 25 million people.

Tucson is becoming increasingly dependent on the Colorado, whose water comes here via the Central Arizona Project's 336-mile canal.

After passage of the 1992 Grand Canyon Protection Act, the Clinton administration tried to replicate the river's natural flows. With much fanfare, Interior Secretary Bruce Babbitt opened the dam's floodgates in 1996; another flooding experiment was tried in 2000.

Despite initial claims of success, scientists now say the results were minimal. A lack of sediment in the river made it tough for sandy areas to expand, and many gains were quickly washed away.

Scientists want to create more floods and time them when the Paria River is dumping sediment into the Colorado.

But the drought has caused that tributary, 15 miles below the dam, to deposit less silt in the past three years than any time in recorded history.

Raley said at first he was "deeply, deeply skeptical about the experimental flow program." But, after talks with scientists on a river trip, Raley accepted it was "good science and it was worth taking the political risks to move forward."

"We know when we're being gamed. Had we sensed that, we probably would have slow-walked, ducked, evaded and done everything not to move forward," he said.

John Weisheit, an environmentalist with the group Living Rivers who would like to see Glen Canyon Dam removed, was encouraged by Raley's words. But he said the Interior Department still isn't spending enough money to restore the Grand Canyon.

In the past 30 years, researchers have flip-flopped on whether the Canyon was losing or gaining sediment, said Jack Schmidt of Utah State University. Some thought the lack of floods created a surplus of silt and there was enough sand in the river to form new beaches.

"What we've learned in the Grand Canyon is, the system may be in sediment deficit all the way to Lake Mead," he said.

RRFW Riverwire - PUBLIC TO BE BYPASSED AGAIN

Grand Canyon National Park October 31, 2003

River Runners for Wilderness has learned that a Recommendation for Wilderness Proposal has been submitted to the park by Representative George Radanovich (R-CA, Chairman, Subcommittee on National Parks, Recreation and Public Lands).

Chairman Radanovich is proposing a wilderness recommendation which excludes the Colorado River. Grand Canyon National Park staff are responding to a request from the NPS Directorate to prepare the necessary documentation. Representative Radanovich and committee staff members intend to introduce this alternative through the congressional process as a wilderness bill.

"Here we go again." commented Tom Martin, Co-Director of River Runners for Wilderness "We are in the middle of a public process dealing with the river-wild, where the public, as it has for over 30 years, is clamoring for preservation of the wilderness character of the river, and in steps Congress to bypass the public. In fact," Martin notes, "we are possibly only two months away from seeing the release of the long awaited preferred alternative for the Colorado River Management Plan Environmental Impact Statement. Just like this spring, the summer of 2001, and in 1980, we're seeing an attempt to muzzle the public process. This recommendation not only shuts down the public process," he continues, "but it flies in the face of a court ordered settlement from two years ago to include a wilderness alternative."

Grand Canyon Superintendent Joe Alston and staff are in the process of producing a map that reflects the Chairman's intent, which excludes the river from Wilderness designation. The park is providing narrative explanation that delineates further exclusions besides the river, as defined in the 1993 Final Wilderness Recommendation. RRFW has also learned that the 1993 recommendation will also be included for reference purposes. These documents will be submitted to the NPS Office of Congressional Affairs for final drafting services. The information is being provided as a service to the Chairman and Subcommittee staff, who will then handle all further liaison activities with the Congressman's office relating to the proposed recommendation.

"The river rafting public has discovered that wilderness rivers are an incredibly unique and scarce resource. This recommendation eliminates 240 miles of the best wilderness river running in the world. There are no motorized boats on the river for three months of the year, and no jet-boats at all. The loss of wilderness protections will change all that." remarks Jo Johnson, also of River Runners for Wilderness. "Most importantly, allowing 80% of the public river access to be given to park rafting concessionaires, 75% of which use motorized tour boats to run through the canyon, while the do-it-yourself paddler waits in a 20 year backlog for access, is inconsistent with wilderness management. Thirty years of access wars over the character of the river have taught us that outdated fixed allocations are not what wilderness river running is supposed to be all about."

This recommendation will result in a reduction in wilderness acreage at Grand Canyon National Park. The 1993 Final Wilderness Recommendation proposes 1,139,077 acres. By excluding the river, the amount is reduced by 12,190 acres to 1,126,887 acres of wilderness. RRFW has learned that Grand Canyon National Park has taken no position on this recommendation at this time.

All river runners are encouraged to contact the following congressmen and ask to speak with the environmental staffer. Politely request that the Radanovich Grand Canyon Wilderness recommendation not be introduced while a public process to sort these issues out is ongoing. Even if the listed congressmen below are not in your district, you are all encouraged to contact them as this is a National Park, and therefore a national issue.

Rick Renzi 202-225-2315 Mark Udall 202-225-2161 Tom Udall 202-225-6190 Raul Grijalva 202-225-2435 George Radanovich 202-225-4540 John McCain 202-224-2235

River News 11/02/03

RRFW Riverwire - GLEN CANYON DAM UPDATE

Updated October 31, 2003

Operations

Releases from Glen Canyon Dam in November will be nearly identical to what they were in October. In November, releases will average 8,000 cfs with a total of 476,000 acre-feet scheduled to be released. On Mondays through Saturdays in November, daily fluctuations due to load following will likely vary between a low of 5,000 cfs (during late evening and early morning off-peak hours) to a high of 10,000 cfs (during late afternoon and early evening on-peak hours). On Sundays, releases will be 5,000 cfs from 7 pm until 7 am, and 8,000 cfs from 7 am until 7 pm.

Releases from Glen Canyon Dam in December of 2003 will likely be higher than November. The volume releases in December is likely to be 600,000 acre-feet (an average release of about 10,000 cfs).

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum objective release of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Basin Hydrology

Severe drought conditions in the Colorado River Basin continue. As we move into a new water year there are no signals of the drought easing. Water year 2004 began on October 1, 2003 and the first month of our new water year was much warmer and drier than average. Basinwide precipitation in October was only about 30 percent of average. Soil moisture levels throughout the basin are very low, and as we move into winter it appears likely that the snowpack will be building upon these very dry soils. The scenario is not favorable for next spring's runoff, as much of the melting snow will be absorbed by the dry soil. Reclamation is estimating that with average snowpack conditions this winter, runoff next spring would be about 75 percent of average.

The Colorado River Basin is now in its 5th year of drought. Inflow volumes have been below average for 4 consecutive years. Unregulated inflow in water year 2003 was only 53 percent of average. Unregulated inflow in 2000, 2001 and 2002 was 62, 59, and 25 percent of average, respectively. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

The trend of low inflow continues. Unregulated inflow in October, 2003 will end up being only 55 percent of average. As of October 31, 2003 observed inflow to Lake Powell is about 6,000 cfs, about 58 percent of what is usually seen in late October.

Low inflows have reduced water storage in Lake Powell. The current elevation of Lake Powell is 3,602.0 feet (98.0 feet from full pool). Current storage is approximately 11.9 million acre-feet (49 percent of capacity). The good news is that even after 4 years of

severe drought, Lake Powell is still storing a large volume of water (nearly 12 million acre-feet).

Experimental Flows

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, were completed on March 31, 2003. From January through March 2003 releases ranged between a high of 20,000 cfs to a low of 5,000 cfs each day. These same high fluctuating releases are scheduled to be repeated in January through March of 2004.

The January through March high fluctuating releases were intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub.

The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address the decline of two key resources in the Grand Canyon: sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.uc.usbr.gov/amp/flow_fonsi.pdf.

River News 11/03/03

Endangered Species: Interior mulls warming Colorado River to help humpback chub

April Reese, Land Letter Southwest correspondent

This story is the first of a series on management of natural resources in the Grand Canyon.

GRAND CANYON NATIONAL PARK, Ariz. -- Almost 40 years after Glen Canyon Dam plugged the Colorado River, one of the river's oldest inhabitants is struggling for

survival. But as the debate swirls over recovering the endangered humpback chub while meeting human water demands, the river's federal caretakers have devised a new solution: warm up the river.

The chub, which ranges in size from 5 to 20 inches and can live up to 30 years, evolved in the Colorado River basin 3 million to 5 million years ago. Once numbering in the millions throughout the watershed, the fish has been reduced to a couple thousand, although scientists disagree over just how many remain. While small groups of the fish persist in the upper Colorado River basin, the only surviving lower basin population is in the Little Colorado River, near its confluence with the mainstem in Grand Canyon National Park.

[The largest known population of humpback chub is in the Little Colorado River in the Grand Canyon, where there may be up to 10,000 fish. Photo courtesy of the Fish and Wildlife Service/John Rinne.]

Scientists attribute the species' decline primarily to Glen Canyon Dam, built in 1963 to provide water and power to the interior West. While many credit the dam and its reservoir, Lake Powell, with turning the arid region into a land of verdant farms and booming cities, the project also has drastically changed the ecosystem downstream. The Colorado River, which historically ran muddy and warm, turned clear and cool with the closing of the floodgates.

As incoming water pools behind the dam, its sediment load settles, and the water released through the dam's penstocks is drawn from the cool depths of the reservoir. Water temperatures that once fluctuated seasonally from about 80 degrees in summer to almost freezing in winter now average 46 degrees year-round, according to the Bureau of Reclamation. Biologists suspect the chub and other native fish that have disappeared from the river altogether have difficulty tolerating the cool, clear waters that now flow through the Grand Canyon.

[The picture on the left shows the clear-running Colorado River in the Grand Canyon above the confluence with the Little Colorado River; the other picture shows the murky Little Colorado. Photos by April Reese.]

On a recent data-gathering trip funded by the U.S. Geological Survey, Joe Shannon, a Northern Arizona University-based aquatic ecologist who has been monitoring the Grand Canyon ecosystem for 15 years, pointed out the contrast between the murky Little Colorado and the mainstem river. A recent storm had loaded the Little Colorado with sediment, and its milk-chocolate flow muddied the crystalline main stem where the two rivers meet in Grand Canyon National Park, about 75 miles downstream from the dam.

"That's how the Colorado should look," he said, pointing to the river, which has grown murky under the influence of its temporarily muddy tributary. "It's not supposed to be clear."

It was a rare glimpse of the river as the humpback chub saw it for millions of years, before the construction of the dam 40 years ago. But a quick splash of the hand in the cloudy waters is a reminder that this is still a "designer ecosystem," as Shannon calls it. The water is cool -- too cool for humpback chub to reproduce.

Warming the river

The Bureau of Reclamation, which owns and operates the dam, hopes to improve those conditions by using a "temperature control device" (TCD) to release warmer water into the river. Dennis Kubly of BuRec's Environmental Resources Division said the agency wants to send water from the reservoir's warm surface layer downstream instead of drawing from the deep, cold waters of the lake.

The impetus for the project was a biological opinion issued by the Fish and Wildlife Service in 1994. The agency recommended that BuRec investigate using temperature control technology, which up to that point had only been used to enhance conditions for game fish, to help recover the humpback chub.

In August, the proposal received an endorsement from the Glen Canyon Dam Adaptive Management Work Group, comprised of 25 stakeholders representing the park service, BuRec, FWS, power interests, environmental groups and others. This week, the group formally asked Interior Secretary Gale Norton to give BuRec the green light to go forward with the project. Norton is expected to make a decision on the proposal within the next few weeks.

But several biologists question whether the water drawn from the top of the reservoir will be warm enough to significantly benefit the chub. While BuRec's proposal to increase water temperatures in the river is partly in response to FWS' recommendations, some biologists are concerned that warming the river could benefit non-native fish that prey on the chub as well. For instance, channel catfish -- one of several species, including striped bass and carp, introduced to the Colorado River by fishery managers -- respond to increases in water temperature by speeding up their metabolism, which causes them to eat more food, including chub, Shannon said.

"Right now, those fish may be suppressed by cold water temperatures," said Sam Spiller, Lower Colorado River coordinator for the Fish and Wildlife Service. "There might be more damage if we warm the water." Even so, the increase in temperature could help control cold water species like trout, he added.

Even if the TCD succeeds in boosting chub numbers, it's likely to fall short of federal recovery goals for the species, said David Haskell, a former director of Grand Canyon National Park's Science Center. "The recovery plan calls for [establishing] another major, viable population," he said. "The TCD would not do that."

Shannon was more optimistic. "I think the TCD can work, but only if there's a total reworking of dam operations," so that water releases would more closely mimic historic fluctuations in flows, Shannon said. "Recovery efforts have to be on a big scale, because the dam and its impacts are so big."

If the project goes forward, Kubly said it will probably be implemented in small steps so federal managers can monitor the effects on both native and non-native fish and adjust the plan accordingly.

"In a sense, it's a one-arm-behind-your-back approach," he said. "Not everyone trusts one another, so this makes sure we don't move too far too fast."

It also costs less to go slow, Kubly noted. The initial two-penstock plan will cost about \$25 million; to alter all eight, the cost would be about \$100 million, he said.

The agency has used temperature control devices with some success on other dams, including Shasta on California's Sacramento River, Hungry Horse on Montana's Flathead River and Flaming Gorge on Utah's Green River, Kubly added.

"There aren't any known disasters out there," he said. "By and large, the system responses have either been positive or neutral."

Recovering the chub

But Haskell, who was also a ranger at Glen Canyon National Recreation Area in the 1970s, said the only way to restore native fish -- and the rest of the ecosystem -- is to decommission the dam. He compared the TCD project to "tinkering while Rome is burning."

"If there wasn't a dam, the trout would be dead real quick, because they can't take a lot of this," said Haskell, gesturing toward the murky water.

According to the Fish and Wildlife Service, the chub will be considered for removal from the endangered species list "when five viable, self-sustaining populations have been restored ... and when the fish's habitat has been protected."

With one of the river system's biggest dams just upstream from the largest population of the chub, that's a tall order, say Haskell and other decommissioning advocates.

In addition to the TCD proposal, federal managers have launched a program aimed at killing non-native fish. But that effort, too, is fraught with uncertainty. Some biologists are worried that reducing the numbers will only give the remaining non-native fish more room -- and more resources -- to thrive. The question, Shannon said, is, "How do you kill all the bad fish and grow the good fish?"

Complicating recovery efforts are conflicting management objectives in the same ecosystem, Shannon added. "The park is killing non-native fish, but [state managers] are still stocking them upstream," he said.

Debbie Felker, a spokeswoman for FWS' Upper Colorado River endangered fish recovery program, said the agency is working with state game and fish officials to scale back stocking programs that conflict with endangered species recovery.

The challenge of recovering the humpback chub is part of a larger debate over how to protect the park's resources while meeting water delivery mandates.

Lake Powell is one of several reservoirs that are part of the Colorado River Storage Project, which provides water for seven states: Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming. About 85 percent of the water is used for irrigation; the rest is allocated for residential, commercial and industrial use. Balancing those demands with the protection of an extensively altered river ecosystem is a daunting task, observers say.

Meanwhile, the stakes are becoming increasingly higher for the chub in the Grand Canyon, Shannon said. "If we lose the base flow of the Little Colorado River because of drought, it's all over," he said. "We're talking at most another 20 years."

River News 11/06/03

RRFW Riverwire CONDOR CHICK FLIES!

Grand Canyon National Park

Biologists from Grand Canyon National Park and The Peregrine Fund have confirmed the fledging of the first California Condor nestling in Arizona in perhaps over a century. The flight was observed at 1:30 p.m. on Wednesday, November 5. The chick jumped out looking like it wanted to land but there was nothing there. It ungracefully circled and landed 500 - 600 feet below its cave in a remote canyon. The California Condor was included on the first Federal Endangered Species List in 1967.

"It was spectacular!" announced an excited Sophie Osborn, Field Manager of The Peregrine Fund. "It was not the graceful flight we had envisioned, more like a controlled fall and our hearts were in our throats as it dropped 500 to 600 feet below the nest cave. Minutes after the chick landed it started to explore its environment, tugging on a yucca plant and hopping from boulder to boulder. We waited and hoped so long for this to happen that being part of it was indescribable!" she added.

"Our biggest worry after the chick left the cave was how long it would take for the parents to find it," remarked Chad Olson, Raptor Technician for the National Park Service. "Both parents were away from the area when the chick fledged. To our great relief, female 127 flew to the nest about two hours after the chick fledged, realized the chick was not in the nest cave, immediately found it, and dropped down to feed it. Since fledging is such a dangerous time for the chick it is tremendous to be past this and on to another exciting phase." Olson said.

The chick is healthy and alert to its surroundings. Biologists are planning to attach telemetry equipment and assess overall health issues. The bird will be closely monitored.

"A fledgling condor chick spreads its wings and flies into the wild, and not just the parents share in the pride. The partners who have worked for decades to rescue this species from the brink of extinction see it as a great cause for hope," observed Interior Secretary Gale Norton.

"I have watched adult condors soaring above the spectacular beauty of the Grand Canyon. The birth and flight of this young condor creates optimism that condors will flourish in the Canyon for many generations to come," Norton added.

Biologists first suspected that Condors 123 and 127 were incubating an egg in March 2003. Daily observations were made, with assistance from a group of "Nestwatch" volunteers. The parents became very attentive to the nest in early May. The existence of the chick was confirmed on August 18 after biologists made an arduous 24-mile hike in 100 degree heat down to below the nesting cave. Daily monitoring continued.

"We are very pleased about this new step in the recovery of the California Condor species," stated Joseph Alston, Superintendent of Grand Canyon National Park. "We are proud to be a part of this highly anticipated and monumental event for both the park and the Colorado Plateau. We look forward to working with our partners in order to ensure the well-being of this new arrival to the condor population and to ensure continued success in the program."

Three pairs of California Condors produced eggs in Arizona in 2003 (one in BLM's Vermilion Cliffs National Monument and two in Grand Canyon National Park). Two of the eggs did not hatch, which is not uncommon for California Condors during their early breeding years. In fact, this was the second egg laid by Condor 127 and the third laid by Condor 119. In California this year, one egg was laid and hatched in early May, but, unfortunately, the chick did not survive.

As Roger Taylor, Arizona Strip Field Manager for the Bureau of Land Management (BLM) states, "We have been anxiously awaiting this bird's first flight. With the good condor viewing opportunities that are typically available along the Vermilion Cliffs, perhaps the public will have an opportunity to view the young condor this winter."

"The significance of the first wild-hatched condor in Arizona is tremendous. While captive-bred condors have exceeded our expectations, it is this chick and others like it in the future that ensure condor recovery in Arizona," says Arizona Game and Fish Director Duane Shroufe.

"The partners have watched this chick prepare to fledge with as much anticipation as any natural parent might," said H. Dale Hall, Southwest Regional Director of the U.S. Fish and Wildlife Service. "We all wish the best for this fledgling and look forward to further successes."

The historic Arizona reintroduction is a joint project among the U.S. Fish and Wildlife Service, the National Park Service, The Peregrine Fund, the Arizona Game and Fish Department, the Bureau of Land Management, Southern Utah's Coalition of Resources and Economics, and others. Funding for the project is being provided by The Peregrine Fund, U.S. Fish and Wildlife Service, Arizona Game and Fish Department, Peter Pfendler, National Fish and Wildlife Foundation, Nina Mason Pulliam Charitable Trust, Disney Wildlife Conservation Fund Awards, Steve Martin/Natural Encounters, Grand Canyon National Park Foundation, Bureau of Land Management, Grand Canyon National Park, Kearney Alliance, Grand Canyon Trust, Patagonia, Turner Foundation,

Globe Foundation, Earth Friends, Arizona Public Service, Wallace Research Foundation, Mattie Wattis Harris Foundation, Arizona Community Foundation, and Oracle Corporation Grand Canyon Conservation Fund, and others.

Images and other information may be obtained from the following websites:

The Peregrine Fund: www.peregrinefund.org/press/condor_chick_fledges_2003.html

The Grand Canyon National Park Foundation: www.gcnpf.org, Grand Canyon National Park: www.nps.gov/grca

The California Condors are being released as a "non-essential/experimental population" under section 10(j) of the Endangered Species Act. Section 10(j) provides that the species can be released in an area without impacting current or future land use planning. However, in Grand Canyon National Park condors are provided full protection as federally protected threatened species. This authority has been spelled out further in an innovative agreement between the U.S. Fish and Wildlife Service and local governments. This "Implementation Agreement" spells out a positive working relationship between the Federal government and the various local governments.

Study: Global warming to 'substantially affect' California in 20 years

Associated Press

Sacramento, Calif.

Global warming will substantially affect California in about 20 years, experts say, warning that the state is more vulnerable because of its coastline, its climate and its dependence on Sierra Nevada snowpack for water and hydroelectricity.

"It's going to affect all of us," said Robert Wilkinson of the University of California, Santa Barbara, School of Environmental Science and Management, who wrote a 432-page treatise on the impact on California.

It means a shorter ski season in the Sierra, and poorer habitat for endangered salmon in lower streams. It may mean more wildfires and more floods. Extreme heat waves, easier spread of diseases and increased air pollution all could imperil health.

Oceans that rose 4 inches to 8 inches over the last century could rise up to 3 feet this century, swamping San Francisco Bay estuaries and endangering pumps sending freshwater from the Sacramento-San Joaquin River Delta to the Bay Area, San Joaquin Valley and Southern California.

It will mean more fights over water throughout the West.

"Climate change is upon us. In 20 to 25 years, we really will be working with a different climate," said Michael Dettinger, a U.S. Geological Survey research biologist and researcher with the Climate Research Division at Scripps Institution of Oceanography.

Every scientific model predicts warmer temperatures, with the bulk projecting an increase in the range of 3 degrees to 6 degrees by 2100. But the computer models split on whether California will become wetter or drier.

Either way, warmer temperatures mean a shift in California's water cycle.

The Sierra snowpack that functions as the state's largest reservoir could shrink by a third by 2060 and to half its historic size by 2090. Runoff that fills reservoirs will start in midwinter, not spring. And rain falling on snow will trigger more flooding, scientists said Thursday at a seminar hosted by the Water Education Foundation.

Models projecting a drier California predict a sharp increase in critically dry periods, said Alan Hamlet, a water resources engineer with the University of Washington.

"We're going to have exacerbated conflicts over water, both in California and the Colorado Basin" that also supplies six upstream states, he said. Fortunately for California, it is rare -- but not unheard of -- for the Sierra and the Rockies to have a simultaneous drought, so usually there is substantial water for Southern California from one or the other.

The trends are already in play.

Spring temperatures have increased 2 degrees to 3 degrees since 1950, peak spring snowmelt comes two to three weeks sooner, and vegetation blooms one to three weeks earlier and stays green longer, scientists earlier told a state Assembly committee on water and climate change.

While more dams and reservoirs could capture vital runoff and control flooding, there are substantial questions where or if to build them given the uncertain long-range weather pattern forecasts. Experts predicted the state will have to rely more on conserving and reusing water, desalinization, groundwater storage, and water trades and transfers between regions.

As with the ebb and flow of the Ice Age, warmer temperatures mean grass and oak woodlands and chaparral will grow higher into the mountains over the next 100 years, while conifer forests can grow above the current tree line, said Susan Ustin, an environmental and resource science professor at the University of California, Davis.

But 100 years is a blink in geologic time, and the relatively quick change will disrupt ecosystems that need millennia to adapt, she said. Invasive species that already threaten native plants and animals may be quick to fill that void.

Earlier snowmelt means less spring runoff for salmon, and water could get too warm for them to spawn. Already, runoff into the Sacramento River has dropped 11 percent over the last century.

But warmer weather means longer growing seasons, which could help agriculture -- as long as there's enough water for irrigation, said Rick Snyder, a biometeorologist at UC Davis. While many of California's crops could benefit, its famed wine grapes need a precise combination of temperatures and could suffer, said Snyder and Wilkinson.

The effect could come down to "if you're talking white wine or red wine," said Wilkinson. "Is that a great research project, or what?"

Dry state will fight to restart desalter

Shaun McKinnon

The Arizona Republic

Nov. 7, 2003 12:01 AM

YUMA - Down along the final, gasping miles of the Colorado River, on the edge of a desert too dry to notice the drought, an unusual skirmish has erupted over a plan to squeeze more water from the West's already over-tapped supply.

The battleground is a water desalination plant on this city's west side, a \$280 million white elephant that operated for all of nine months a decade ago, before floods and design flaws forced it into hibernation. The plant was designed to recycle agricultural runoff water that was otherwise too polluted and salty.

Now Arizona wants to restart the desalination plant as a hedge against the drought and has asked the federal government to spend \$30 million to bring it back on line and an additional \$24 million to \$30 million a year to keep it running. Without the plant, Arizona officials say, Phoenix and Tucson could someday face crippling water shortages.

Critics question that claim and say the desalter is a failure best left idle. Even other Colorado River states, sympathetic to Arizona's effort to reclaim the lost water, shy away from the plant's enormous cost and the relatively meager return, about 25 billion gallons of desalted water a year, or roughly 0.6 percent of the Colorado River's total flow. But the fiercest opposition comes from environmentalists, who say that operating the desalter would destroy a thriving Mexican wetland and spoil the first real success story in the struggle to restore the Colorado River Delta. That argument frames a larger one, not about who should use the water or how, but whether it should be used at all.

'Very perplexing'

"There are tough issues," admits Herb Guenther, director of the Arizona Department of Water Resources. "It could be quite a tug of war down there. But if we don't operate the plant, there is a potential for water shortages and Arizona is the one to feel the impact. . . . This is a very perplexing problem."

Perplexing barely begins to describe what's happening here. This is, after all, a story about a desalination plant in the middle of the desert. And it asks a sort of chicken-and-egg question of whether the government should take water from a wetland that was the unintentional creation of that plant in the first place. Racing through it all is a gnarly tangle of issues: the environment, border politics, public money and, gnarliest of all in the West, water and how it should be managed.

"There is a taxpayer issue and an environmental-impact issue," said Lisa Force, Arizona program director for the advocacy group Living Rivers. "But the bigger issue is about the Bureau of Reclamation continuing to operate in an old-fashioned way. Re-operating the desalination plant is more of the same old pork-barrel politics, continuing to throw away taxpayer dollars on unsustainable water projects. "There are so many other options to create new water."

30 years of history

As odd as it sounds here at the end of the mighty Colorado, creating new water - or at least wringing every last drop from the water that already exists - is where this story started three decades ago when Mexico complained that the water flowing out of Arizona was too salty.

Mexico is entitled to 1.5 million acre-feet per year from the Colorado, about 489 billion gallons. Because Mexico is last on the river, it sometimes has had to settle for the dregs, often irrigation runoff from farms around Yuma and across the border in California.

Mexico finally complained that the water it was receiving was too salty, unfit to irrigate crops. Although the Colorado River originates half a continent from an ocean, it's one of the saltiest freshwater rivers in the country. It picks up minerals along its rugged 1,400-mile route, along with runoff from thousands of acres of irrigated farmland. In all, the river carries 9 million tons of salt a year, the equivalent of nearly 250 full railroad cars a day. To reduce the salinity of the river as it crossed the border, the United States decided to build a desalination plant at Yuma. The plant would take heavily polluted water from farms in the Wellton and Mohawk valleys to the northeast - water that had been running back into the Colorado and down to Mexico - treat it and return it to the river, in effect using it twice by recycling it.

"The plant is just a tool for salinity on the Colorado river," said Jim Cherry, who oversees the desalination plant as Yuma-area director for the Bureau of Reclamation. "It's just one of the tools. It won't change the salinity of the river significantly - it's almost like running a hose into the swimming pool - but it's a good amount of water we save (by recycling)."

The bureau fired up the plant in late 1992 at one-third capacity. It operated for about nine months, then shut down after a flood on the Gila River washed out one of the delivery canals. A chain of frustrating design flaws kept the plant inactive and a series of wet years in effect rendered the plant unnecessary. Enough water was flowing down the Colorado to fill Mexico's orders.

That changed this year. The drought sucked up all the surplus water and forced the Bureau of Reclamation to draw about 35 billion gallons of water from Lake Mead.

Although the reservoirs are nowhere near running out of water, many scientists predict that drought conditions will persist for years. Both Utah and Colorado are considering plans to use more of their river allocations. If the river can't deliver enough water, Arizona - specifically the Central Arizona Project, which supplies Phoenix and Tucson - is the first to have its flow halted.

Water shortage risks

"The desalter is important to Arizona because it reduces our long-term risk for shortages," said Tom Carr, who oversees Colorado River issues for the state Water Resources Department. "Reducing the water in storage on the river is a significant issue." So is time, Carr said. Fixing the remaining design flaws and preparing the desalination plant for full-scale operation would take four to five years. An environmental-impact study could stretch that timetable. Congress will have to appropriate up to \$30 million just to fix the design flaws and prepare the plant to operate.

State officials worry that the price tag could hold up their request. The annual operating budget would likely top \$29 million, about \$311 per acre-foot delivered to Mexico, or about 30 times what Yuma farmers pay. But they say a long-term water shortage in Arizona could run up damages of more than \$300 million in lost crops and money spent to find alternate sources.

Shifting money to the desalter would probably mean taking it from other uses, said Bob Johnson, regional director for the Bureau of Reclamation in Boulder City, Nev. Although the agency is moving ahead with an environmental-impact study and repairs to the desalination plant, officials also are exploring other ideas.

Most often mentioned is leasing water from farmers along the river or paying them to leave croplands unplanted. "My guess is if you packed something correctly, you could probably get some water out of there at a lesser cost and with less of an environmental impact than operating the plant," Johnson said. Other states along the Colorado have expressed limited support for Arizona, but they also suggest there may be better alternatives.

"It's been in storage a long time and the technology has changed tremendously. We need to know if it is cost-effective to upgrade it," said Kay Brothers, deputy general manager of the Southern Nevada Water Authority in Las Vegas.

Arizona officials say the other options are even more expensive. Leasing water or paying farmers to fallow land could cost nearly \$54 million a year, the state estimates. A plan to bank surplus water underground to allow more water to flow down the river could cost nearly \$40 million.

Water leases or purchases are equally troublesome, said Carr of the Water Resources Department. If an irrigation district, for example, agrees to give up some of its water, other users on the river, such as California or the CAP, could claim the water first, leaving the state and the bureau no better off than before.

"Arizona pays the price no matter what," said Larry Dozier, deputy general manager of the Central Arizona Project. "It's pretty apparent if there is land fallowed, it would be in Arizona. And if they use system water, well, we're on the short end of the stick, so if you give up system water, you give up CAP water."

Dozier said if the bureau would upgrade the desalter's technology, it could increase output and feed more water into the system.

Far more troublesome for Arizona and the bureau are the claims raised by environmental groups that the desalter would destroy the Cienaga de Santa Clara, a wetland about 50 miles south of Yuma in Mexico that supports hundreds of species of birds, fish and other wildlife.

The wetland is, in a way, a byproduct of the desalter. While the plant was under construction, the agricultural runoff it would someday treat was diverted south toward what was then a mostly dry corner of the Colorado River Delta.

Because the plant only operated for nine months, the water continued to flow into Mexico. Over the years, it formed the wetland, in effect restoring a sliver of the delta. It is home to dozens of endangered species.

"The delta is coming back by itself," said Michael Cohen, a senior associate for the Pacific Institute, a water research and advocacy group. "They added water and it came back. Vegetation springs up in response to water. It's pretty clear-cut. There are studies that show when they took the water out in the '90s, it dried up. Here's a benefit that has occurred just because people added water."

Three strikes?

If the government restarts the desalting plant, that water will be taken away again. Using existing technology, the desalter can recover as much as 75 percent of what it treats. The remaining 25 percent would be returned to the diversion canal and sent south to the wetland, but it would be up to six times saltier than before.

"They reduce the amount of water, that's strike one," said Steve Cornelius, a Colorado delta specialist for the Tucson-based Sonoran Institute. "The water that does get there will be higher in salinity. That's strike two. The cattails there are pretty resilient, but they're not going to be able to survive that change."

Arizona officials concede that the wetland could suffer some damage if the desalination plant is restarted and the flow of runoff water is altered. But they say the plant's construction was responsible for the wetland's almost accidental creation, an accident that was never meant to happen.

"The original environmental study acknowledged there would be a temporary wetland down there," said the CAP's Dozier. "It would evolve into something different once the plant was started." The fact that the marsh grew over the years is unfortunate, Dozier said, but doesn't alter the original assessment.

Contentious times

That argument peeves conservation advocates: "They did create the wetland area by mistake, but in order to do that they had to destroy it first," said Force, with Living Rivers. "That was a much more biodiverse area before. It did have wetlands, and it also had riparian corridors, estuaries and much more complex ecosystem that died when they filled the reservoirs."

Instead of trying to drain the river dry with a recycling plant, water managers should confront the issue of whether cities and farms should claim every drop of water in the river, Cornelius said. "The river itself needs water," he said, enough to restore flow all the way to the Gulf of California. Returning the freshwater mix to the gulf would not only benefit wildlife habitat, but fisheries along the coast that have been devastated by the loss of the delta.

"It was fortuitous that the cienaga became what it was today," he said. "We ought to be looking at this as a positive thing instead of a mistake."

Both the state and the environmental groups are preparing for a contentious study period. Carr plans to meet with a conservation advocates in the coming weeks and pledged to listen to their concerns and their ideas. He'll get an earful

"When you take on anybody on water in the West, it's tough," Force said. "Everybody's very protective of the old way of doing things. But we have a diverse group this time, taxpayer groups, environmental groups, even farmers who want to lease water. It's going to be a tough battle, but it's going to be worth it."

RRFW Riverwire - WILDERNESS UPDATE AND THANK YOU!

Thanks to all the folks who called into your elected officials about Representative Radanovich's (R-CA) river-less "wilderness" proposal. The wilderness documents, with the Colorado River omitted, were requested from Grand Canyon National Park by the representative's office. RRFW has learned that these documents are being forwarded to his staff, but the representative has not yet submitted a bill based on this material. Your congressional leaders heard you loud and clear, and it helped! It turns out many congressional members do not take kindly to this sort of back door approach to wilderness management, especially at a place like Grand Canyon National Park. Indications are that a member of congress will submit a counter bill with the river

included. This will be done in the event a bad river-less wilderness bill is introduced, to stop the bad bill so that the public process is allowed to continue.

The Radanovich spurn-the-river proposal would circumvent the public management plan that has already generated over 50,000 comments. The clear signal from congress is that the on-going Colorado River Management Plan should be allowed to run its course without pressure from the park's own river concessionaires to bypass the public process. "There is no doubt we will need to keep up the pressure with more phone calls in the future" notes Jo Johnson, River Runners for Wilderness co-director. "We are grateful to Grand Canyon lovers who have been responsive to this issue. Circumventing the process allows the nightmare of fixed allocations to continue while trashing park wilderness values."

RRFW will continue to keep you informed of developments as they happen.

Eco Fighting for Rivers: Living Rivers keeps David Brower's legend alive

Paddler Magazine

By Matt Hansen

November/December 2003

It's a warm June morning on the Yampa River and 66-year-old river guide Dee Holladay stands in the shade of Mantle Cove, a magnificent alcove of sandstone in Dinosaur National Monument that harbors ruins from the ancient Fremont civilization. While his guests quietly peruse the alcove, Holladay watches swifts dart back and forth among the high cliffs. The birds are making a ruckus but only a few others notice them. "Look," he says, using his stained coffee mug as a pointer, "they're fighting."

The same could be said about many of Holladay's floatmates this week--although they're not fighting each other, they're fighting for rivers. The nonprofit Living Rivers--an environmental group primarily focused on draining Lake Powell--has gathered river and wilderness advocates to float the canyons of the Yampa and Green with Holladay's Holiday River Expeditions. The trip's purpose is to celebrate the life of David Brower, who first floated through Dinosaur in 1953 as the head of the Sierra Club. Afterward he singlehandedly defeated two dams that had been proposed for the monument. In doing so, he launched the modern conservation era but forsook Glen Canyon, which now sits below the motor-heavy waters of Lake Powell. It was a decision that haunted Brower the rest of his life. A cunning fighter for wilderness, he died in 2000 at the age of 88, but his fight presses on through Living Rivers, which he helped found just before his death.

Those floating with Holladay in June included Roderick Nash, whose 1967 book *Wilderness and the American Mind* has been noted as one of the most definitive pieces ever written on wilderness; Jeffrey Ingram, an activist characterized in Marc Reisner's book *Cadillac Desert* as Brower's "most valuable" asset in successfully fighting off dams proposed for the Grand Canyon in the 1960s; Kim Crumbo, former Grand Canyon river guide and activist with the Arizona Wilderness Coalition; and former river guide John Weisheit, who serves as Living Rivers' conservation director. They're all fighting for more responsible water usage, specifically fewer dams and eliminating motorized vessels on the Colorado in the Grand Canyon. "This is not a happy river," says Ingram of the Colorado. "Outfitters spend hundreds of thousands of dollars to defend themselves against outside interests. Private floaters are angry because of the grievances they go through to get on the river and because they're discriminated against. And people like me have been angry for 30 years because we think it should be wilderness."

Among those present, the 49-year-old Weisheit is these days the one most often tangling with the Bureau of Reclamation and Western politicians. The Los Angeles native first met Brower in the early 1990s, when he told Brower that he hated him for not fighting Glen Canyon Dam. Brower responded by asking for forgiveness, and for help. So that's what Weisheit did. And it's Glen Canyon Dam that he has in the crosshairs, although there are others on his agenda (see sidebar). "We can't manage our rivers this way," he says. "We have sacrificed our natural heritage for short-term gain."

But for these activists, going after Glen Canyon Dam is akin to a mosquito trying to suck a bison dry. The Glen Canyon National Recreation Area and Lake Powell are visited by more than 2 million people annually--making it one of the National Park Service's most popular sites. The Bureau of Reclamation says the reservoir ensures water for millions of Southwest residents. Perhaps more important, however, the Bureau sees Glen Canyon Dam as a symbol of its ability to fundamentally change the desert landscape. Giving up Lake Powell would require the Bureau to turn its back on nearly a century of dogmatic belief that the Colorado River must be harnessed in order to make it valuable. Indeed, this summer Bureau Commissioner John Keys was quoted by *The Associated Press* as saying the decommissioning of Glen Canyon Dam "is something that's never going to happen. I won't spend a dollar studying it."

Barry Wirth, public affairs officer for the Bureau's Upper Colorado Office in Salt Lake City, says furthermore that if Glen Canyon were drained, there would have to be someplace else for that water to be stored. That reservoir, he says, is simply too important to the well-being of the seven states that depend on the Colorado River. "The current drought has clearly driven home the importance of Glen Canyon Dam," he says, adding that the Bureau's focus is how to balance the needs of agricultural and industrial interests, the public and conservation groups.

Given such statements, Ingram, 66, says being an activist is like "banging your head against a 710-foot concrete wall," which, incidentally, is the height of Glen Canyon Dam. But Weisheit, like Brower before him, doesn't belch anger despite his fanatical belief that Glen Canyon Dam wastes water and is killing the Grand Canyon. He speaks softly

and fluidly, smiling often. He sees children as his inspiration, hoping to give them the chance to visit the former Glen Canyon with their own children.

Despite the enormous task, Weisheit believes he will see Glen Canyon drained. "Congress built these dams and said we'd worry about the problems later" he says. "Well, later is now, and the public needs to know there are alternatives." One of Lake Powell's primary problems is the loss of water due to sediment buildup, seepage and evaporation. According to Scott Miller's 2000 report titled "Undamming Glen Canyon," published in the Stanford Environmental Law Journal, some 65 million tons of sediment fills Lake Powell each year, reducing storage capacity. Evaporation accounts for the second highest consumptive use of Lake Powell's waters, behind only irrigation. Bank seepage accounts for 350,000 acre-feet of water being lost each year. The hydropower produced by the dam provides electricity for only 3 percent of the region, according to Miller. And the cold, clear water being sent through the Grand Canyon harms endemic fish that have evolved over millennia in warm, silty water. "These systems are going to fail before our mortgages are paid," says Weisheit. "And I don't want to pass our poor planning on to future generations. It's unacceptable and it's embarrassing."

Weisheit also points out that this year Lake Powell was only half full due to the drought. He says if the current drought persists, the reservoir will be empty in two years, rendering the dam useless for water storage and power generation. Of removing the dam, he says, "people are beginning to believe that it's not impossible."

On the day that Holladay and his group float into Echo Park, the confluence of the Yampa and Green and approximate site of one of the two proposed dams Brower defeated, he asks everyone to stay silent, allowing their senses to take in the canyon's immensity and the power of two rivers becoming one. Overhead a turkey vulture rides a thermal, floating gently among the 500 foot high canyon walls. Cliff swallows dart back and forth looking for insects. On the bank a lone deer grazes quietly. The sun is warm and the Yampa's muddy waters sparkle beneath an unspeakably blue sky. Other than the sound of the oars plying the river, it is silent. As Roderick Nash floats his dory through these spared canyon walls, he reflects on the significance of Brower's fight. "The only reason why we're not on a lakeshore right now," he says, "is because somebody cared."

Sidebar

Glen Canyon Dam isn't the only bull's-eye being targeted by Living Rivers. The several-hundred-member-strong group promotes large-scale river restoration, habitat preservation and responsible water use. Among the many issues on its agenda, the group has asked the Bureau of Reclamation to decommission Flaming Gorge Dam in northeast Utah. Flowing cold and gin clear from the dam, the Green River here is the best tailwater trout fishery in the country, but Living Rivers contends that the cold water coming from the reservoir is killing the warm-water-loving and endangered humpback chubs as well as the riparian habitat downriver in Dinosaur National Monument. Living Rivers is also trying to preserve a permanent water flow into the Colorado River Delta in Mexico's Gulf of California. In addition, the group opposes the Big Straw, a proposal to

siphon water from the Colorado River near the Utah-Colorado border and pump it back to the Front Range of the Rockies to fuel urban growth. "As these depletions continue, we'll find fewer rivers to run because we can't seem to lose our addiction for irresponsible water use," says Living Rivers' John Weisheit.

River News 11/14/03

RRFW Riverwire - Interior Dept. Favors More Canyon Flooding

By Mitch Tobin, ARIZONA DAILY STAR

Despite initial resistance, the Bush administration favors continued experimental floods meant to restore the Grand Canyon's ecology, a senior official said in Tucson on Tuesday.

Assistant secretary of the Interior Bennett Raley, the administration's point man on water issues, spoke to 60 scientists at the start of a three-day meeting on how Glen Canyon Dam affects the Colorado River.

Researchers explained how they're using lasers, underwater cameras, century-old photos and experimental flumes in Minneapolis to learn how sand grains and Volkswagen-sized boulders move through the Canyon's rapids and eddies.

Raley urged the scientists not to politicize their work and to remember that "science is not the only input factor for management of the Colorado River."

"If scientists are sloppy and mix advocacy with science, you will end up with the same public perception of integrity that lawyers have," said Raley, a lawyer by training.

Glen Canyon Dam, completed in 1963, dramatically altered the Colorado's flow. Before the dam, the warm, muddy river roared with spring snowmelt. Sediment was lifted onto beaches and sand bars, creating wildlife habitat and backwaters vital to native fish, such as the endangered humpback chub. The beaches are still important campsites for boaters.

After the river was plugged to stabilize the Southwest's water supply, it ran colder and clearer below the dam, which trapped 90 percent of the silt. But dam releases - which often fluctuate with the Sunbelt's electricity demands - have also caused the Colorado's baseline flow to double downstream. As a result, much of the silt and gravel deposited by the Grand Canyon's 740 tributaries gets whisked into Lake Mead downstream.

"It wasn't that we just lost the spring floods, which redeposited sand," U.S. Geological Survey researcher Ted Melis said, "we lost the low-flows the rest of the time, which were low enough to retain those inputs for use during the high-flows. We're getting hit on both ends."

The result is an ecosystem transformed by a dam that helps supply water and power to 25 million people. Tucson is becoming increasingly dependent on the Colorado, whose water comes here via the Central Arizona Project's 336-mile canal.

After passage of the 1992 Grand Canyon Protection Act, the Clinton administration tried to replicate the river's natural flows. With much fanfare, Interior Secretary Bruce Babbitt opened the dam's floodgates in 1996; another flooding experiment was tried in 2000. Despite initial claims of success, scientists now say the results were minimal. A lack of sediment in the river made it tough for sandy areas to expand, and many gains were quickly washed away.

Scientists want to create more floods and time them when the Paria River is dumping sediment into the Colorado. But the drought has caused that tributary, 15 miles below the dam, to deposit less silt in the past three years than any time in recorded history.

Raley said at first he was "deeply, deeply skeptical about the experimental flow program." But, after talks with scientists on a river trip, Raley accepted it was "good science and it was worth taking the political risks to move forward."

"We know when we're being gamed. Had we sensed that, we probably would have slow-walked, ducked, evaded and done everything not to move forward," he said.

John Weisheit, an environmentalist with the group Living Rivers who would like to see Glen Canyon Dam removed, was encouraged by Raley's words. But he said the Interior Department still isn't spending enough money to restore the Grand Canyon.

In the past 30 years, researchers have flip-flopped on whether the Canyon was losing or gaining sediment, said Jack Schmidt of Utah State University. Some thought the lack of floods created a surplus of silt and there was enough sand in the river to form new beaches.

"What we've learned in the Grand Canyon is, the system may be in sediment deficit all the way to Lake Mead," he said.

RRFW Riverwire - Free Grand Canyon Slideshow Comes To Durango

Author Tom Martin will be in Durango at the Abbey Theater at 6:30 p.m., Nov. 30, to update local boaters on the controversial Colorado River Management Plan (CRMP) now in progress for Grand Canyon National Park, and how this plan will affect the boating public. Tom will illustrate his talk with a slide show on the Grand Canyon based

on his book, *Day Hikes From The River: A Guide to 100 Hikes from Camps on the Colorado River in Grand Canyon National Park*.

The highly controversial CRMP, which was stopped by the Park in 2000, was restarted as part of a settlement agreement in a lawsuit filed by river running groups and individuals. The public comment period during the past summer gathered over 50,000 comments. "The wait for do-it-yourself river runners is so long, those at the bottom of the list will wait an incredible 20 years to get permission to run the river" said Martin, who notes that "you can book a commercial trip tomorrow for next summer, if you can afford it. This process is of vital interest to all Colorado boaters, as more Coloradoans are waiting for a permit to boat the Colorado River in Grand Canyon than river runners from any other state."

The free slide show will be open to the public and features beautiful vistas illustrating Grand Canyon hikes you can do from the river and exciting river running shots. Tom will be signing books, the sale of which will benefit River Runners for Wilderness, a non-profit group which is sponsoring the event. RRFW represents the interests of the boating public. Taxpayers for the Animas River and the Weminuche Group of the Sierra Club are co-sponsoring the event locally.

Following the slide show, there will be an 8:30 p.m. screening of the movie, "The Same River Twice." This award winning independent film is about a group of friends who re-ran Grand Canyon 25 years after their first trip. There will be an admission charge for the movie.

Feds gear up for new round of test flows to aid Grand Canyon

April Reese, Land Letter Southwest correspondent

GRAND CANYON NATIONAL PARK, Ariz. -- Seven years after releasing a torrent of water from behind Glen Canyon Dam to provide a much-needed ecological boost to the Grand Canyon, federal water managers are preparing to try it again. But while the dam's gatekeepers hope this experimental flood will bring back some of the river's wild characteristics, some scientists and river advocates say those good intentions may not be enough.

The Colorado River once raged and whimpered through the Grand Canyon in accordance with the seasons, swelling during the monsoons and laying low during dry periods. Those changeable flows alternately carried huge amounts of sediment into the canyon and deposited it in the river channel and on the banks, creating sandbars and

beaches. The muddy river also provided prime habitat for several species of native fish (Land Letter, Oct. 30).

Glen Canyon Dam, completed in 1963, drastically altered the historic flow regime and reduced the amount of water -- and sediment -- transported downstream. According to federal estimates, about 90 percent of the sand and silt carried by the upper Colorado River now settles in Lake Powell, the reservoir created by the dam.

The result has been a sediment-starved canyon with fewer and smaller sandbars and beaches, less backwater habitat for native fish and a clearer river that is alien to native fish accustomed to murky water.

Now, the Bureau of Reclamation is poised to open the floodgates in an attempt to deliver some of the sediment that is so crucial to the ecosystem -- and to boaters who camp on the canyon's beaches.

BuRec spokesman Barry Wirth said the agency, which operates the dam, plans to release water from the dam at a rate of about 45,000 cubic feet per second for two days. The volume of water will be about the same as it was in the 1996 flood, but the tap will be shut off six days earlier this time. Scientists and managers monitoring the earlier flood found that continuing the high flows after two days brought no additional benefit, said Bob Hart, a hydrologist with the U.S. Geological Survey in Flagstaff, Ariz.

"Within the first couple of days, the goal was reached," Hart said.

Building the beaches

But the biggest change this time around will be in the timing, Wirth said. The surge of water will be released after the Paria River, a tributary of the Colorado just downstream of the dam and above the park, is running high and thick with sediment. The hope is that timing the rush of water from the dam to coincide with high sediment loads in the Paria will bring more sand and silt into the canyon, where it will build sandbars and beaches and muddy up the river for the endangered humpback chub.

With the dam trapping most of the Colorado's sediment, the Paria River is crucial for delivering what little sediment the canyon receives, said Utah State University professor Jack Schmidt. "The Paria River is the only major source of sediment for the first 60 miles of the Grand Canyon," Schmidt said. "So it's the only significant natural source that the canyon has. It's everything."

A USGS study found that an August 1992 flood of the Paria River delivered 544,000 tons of sediment -- primarily sand -- into the Colorado in less than 24 hours. Typically, flows of that size occur on the Paria about every two years, according to USGS. In all, the Paria dumps about 1 million tons of sediment downstream during the monsoon season in late summer and early fall.

But this year is not a typical precipitation year. BuRec, the National Park Service and USGS have signed off on the necessary environmental studies for the project, and it has the blessing of the Bush administration. The only thing missing is rain.

"We're just not getting the floods during the monsoon season that we need," Wirth said. "The big key is having enough sediment flowing out of the Paria River to justify having the experiment." Without a roiling Paria, there cannot be experimental flows, he said.

A sense of urgency

Nikolai Ramsey of the Grand Canyon Trust said he is supportive of the test flows, but cautioned the canyon may not be able to wait for the drought to recede. "If the weather helps us, we're in good shape for an experiment. If it doesn't, we're still stuck with a sediment-starved system," Ramsey said.

A more timely idea, Ramsey said, is to move the sediment that is building up behind the dam -- at a rate of 6 centimeters annually, by some estimates -- downstream. While that solution may come with its own set of issues--including the potential for carrying heavy metals into the canyon and a price tag of up to \$500 million--it would guarantee a dependable supply of sediment to the canyon, he said. That, in turn, would head off difficult questions about whether to decommission the dam, Ramsey added.

"The ecosystem in the Grand Canyon would recover, and power and water supplies would be secure," Ramsey said.

Wirth said that option is not on the table. "It's never been studied from a scientific viewpoint," he said. "Maybe some day. Right now we're focused on that which is probably more realistic."

The experimental flows come at a crucial time because there simply is not much sediment left to manipulate, Schmidt said. "We're losing the beaches in the Grand Canyon and continue to do so. Either this will work, or we'll know it's impossible."

If it does not work, federal managers could be left with some tough choices, he added. "Basically, we'll either have to come up with a radical new solution, or announce to the public that we've raised the bar too high--that the price paid for the construction and operation of Glen Canyon Dam is the progressive deterioration of the ecosystem of Grand Canyon National Park," Schmidt said.

John Weisheit, conservation director for the advocacy group Living Rivers, supports decommissioning the dam as the only long-term solution. "These experiments are going to show that the dam does need to come down because the sediment the canyon needs is above Glen Canyon Dam," Weisheit said.

"They're going to have a sediment deficit as long as the dam is there."

But decommissioning is highly controversial and would involve major changes in how water tagged for downstream states is stored and distributed. Lake Powell is one of several reservoirs in the Colorado River Storage Project, which provides water for Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming. About 85 percent of the water is used for irrigation; the rest is allocated for residential, commercial and industrial use. Removing the dam would also eliminate a power source for Southwest cities, critics add.

For now, federal water managers are waiting to open the floodgates and see what happens when the sediment-rich water pulses through the Grand Canyon.

"We're ready to do it," Wirth said. "I think we're going to show, over time, some positive results."

River News 11/26/03

RRFW Riverwire - THE NEXT GENERATION GRAND CANYON RIVER GUIDEBOOK

River Runners For Wilderness is pleased to announce the imminent release of a "next generation" Grand Canyon guidebook written by boaters for boaters! Preview copies have gotten rave reviews for the wealth of information presented in a easy-to-use format. It's been called the definitive Grand Canyon river guide.

Tom Martin, author of Day Hikes from the River, & Duwain Whitis, publisher of RiverMaps map books, have teamed up to write a new guidebook titled Guide To The Colorado River In The Grand Canyon - Lees Ferry to South Cove. This is the only guidebook to the canyon with USGS topographic map backgrounds, printed at their original scale, with additional map detail added in an easy-to-read format. In addition, it is the only guide with maps extending to South Cove in Lake Mead. Each map shows campsite locations, rapids, scout points, river miles and other points of interest. The accompanying mile-by-mile text describes all campsites on the park inventory (and some not on the inventory), with campsite pull-in information, geological, botanical and historical points of interest. All of the significant hikes, rapids and scouting points are also described, with color photographs on almost every text page. The Guide is 8.5" X 14" spiral-bound to lay flat. The 108 pages are printed on tough water proof and tear resistant synthetic paper. Published by Vishnu Temple Press.

RRFW is pleased to be able to take advance orders for titled Guide To The Colorado River In The Grand Canyon - Lees Ferry to South Cove. The cost of this river guide is \$29.00 (\$25.00 each, plus \$4.00 shipping and handling per Guide), with a tentative shipping date of February 27, 2003. Checks or money orders only please. Advance guidebook sales will benefit River Runners For Wilderness, a not-for-profit organization seeking equitable access to a wilderness river running experience in Grand Canyon. Please send your order to:

River Runners For Wilderness PO Box 17301 Boulder, CO, 80308-0301

If you'd like to place an order for that special Christmas someone, just let us know with your order and we'll send an announcement card before Christmas, letting them know they will be receiving a gift from you soon.

For additional guidebook information and dealer inquiries, contact: Vishnu Temple Press, PO Box 30821, Flagstaff, AZ 86003-0821 Info@vishnutemplepress.com

Living Rivers Currents 12/01/03

WAPA Blues: Hydro Not Missed

The ongoing drought is seriously effecting hydroelectric power production on the Colorado River. Colorado River Storage Project (CRSP) dams are experiencing an overall reduction of 25% from normal. The Western Area Power Administration (WAPA), the agency which distributes federal hydropower, must now purchase electricity from private sources to meet their long-term obligations to their customers.

The Bureau of Reclamation has emphatically stated that the region could not survive without power from Glen Canyon Dam. The drought has demonstrated this to be untrue, with surplus power from non-federal projects easily making up the shortfall. Should the pattern of drought continue for another two years, Lake Powell reservoir will lower to the point where Glen Canyon Dam's powerplant will become inoperational.

This situation will effect US taxpayers. Congress mandated that hydropower revenues must repay the loans used to build CRSP projects. Lower reservoir levels mean less power and less revenue to meet these loan obligations. Additionally, power purchased by WAPA to replace the difference comes at premium price, further effecting loan payments which are scheduled for full payment in about fifty years.

According to WAPA spokesperson LaVerne Kriss, this is not yet a problem. "When we have cash flow problems, we use a pool called the Colorado River Basin Fund to float us through times of shortage, and we make up the difference when the reservoirs recharge and surplus water becomes available again."

"Not true," says Living Rivers' conservation director John Weisheit. "That fund has been near zero for some time, and with persistent drought it's not going to be replenished anytime soon."

This will also cause further strains for WAPA-supported recovery programs, which are designed to mitigate the negative impacts from CRSP operations on the critical habitat of endangered species. The failure of these recovery programs will only drive the budget up further and will undermine WAPA's payback schedule over time. "WAPA will never break even. In fifty more years they will be forced to mitigate other impacts such as sediment removal from the reservoirs. When this occurs the taxpayers will have to contribute to unprecedented subsidies to keep these projects operational," concludes Weisheit.

Living Rivers Currents 12/01/03 **Science Performs: Management Ignores**

Scientists meeting in Tucson this past October were criticized by the Department of the Interior for expressing little confidence in federal efforts to mitigate the downstream impacts of Glen Canyon Dam operations on the Colorado River ecosystem in Grand Canyon National Park.

“Advocacy positions belong to lawyers,” said assistant Secretary of the Interior, Bennett Raley, to the assembled scientists, many who have expressed frustration that their research is being ignored.

Dr. Jack Schmidt, a geologist who’s worked in Grand Canyon for 15 years, stressed that scientists have done their jobs well in reporting accurately to Interior’s Adaptive Management Working Group (AMWG) and then asked, “When is AMWG going to act upon this knowledge?”

Raley stated that Interior could “drag it’s feet” if it did not like what was being recommended. Raley, a water attorney by profession, who has asked Congress to repeal the Endangered Species Act, openly advocated to the scientists the concerns of water and power suppliers, and that these interests maintain superior political and legal positions as compared to environmental interests. He argued that the Grand Canyon Protection Act should be subservient to prior Colorado River laws, and river

management policy should therefore follow such a doctrine. Nonetheless, scientists should “continue to support” the adaptive management process.

Dr. Richard Valdez, a senior researcher of endangered fish, gave strong recommendations to AMWG concerning the endangered Humpback Chub by saying, “If you are not going to address the threats to their critical habitat, then you will continue to have endangered species in Grand Canyon.” Humpback Chub populations have declined 75% to just 2,000 adult fish over the past eight years.

Although this gathering was organized specifically for AMWG, very few of its members actually attended. The program is presently facing increased criticism as it was established to recover endangered species in Grand Canyon, but native species diversity has actually declined under their management.

Hydrologist William Vernieu reported on the impacts of drought on Lake Powell reservoir and the downstream implications for Grand Canyon’s water chemistry, which has so far been ignored by AMWG. The reservoir is currently experiencing a decrease in available oxygen along with increases in phosphorus, nitrates and salt. Such changes in water quality will exacerbate the decline in the river’s native food base for endangered fish.

The meeting illustrated that the political situation regarding Grand Canyon’s management is deteriorating as rapidly as its ecology. Several scientists admitted privately that absent some form of litigation, there will be little chance of recovering the natural and cultural heritage of Grand Canyon before these resources are lost forever as a result of operations at Glen Canyon Dam.

Living Rivers Currents 12/01/03

Grand Canyon Management: Stepping Backwards

In 1986 the Department of the Interior requested that the National Academy of Sciences review their science program for the Glen Canyon [Dam] Environmental Studies (GCES). While many of the Academy’s recommendations were applied by science managers in the Grand Canyon, and continued by subsequent program managers, politics and budget considerations are once again compromising the integrity of science. The National Research Council of the Academy encouraged the GCES to “solicit scientific talent for the work based on a research plan [through a peer-reviewed request for proposals],” and to “use merit competition to select researchers, including a peer-review system outside the agency or agencies conducting the study.”

David Wegner, former director of science for the Bureau of Reclamation, informed Living Rivers that, “The advice the Academy gave GCES was very helpful to the science community. We are very proud of the programs that later developed, which continued on through the EIS process of the early 1990s.” Even after the Environmental Impact Statement this attitude prevailed during the research and monitoring phase under the

auspices of the Grand Canyon Research and Monitoring Center (GCMRC), which is administered by the US Geological Survey in Flagstaff, Arizona.

Living Rivers has recently cautioned members of the Adaptive Management Program (AMP) that research programs are reverting back to old ways. This turn of events is gaining the attention of scientists who are fearful that heavy administrative costs will hinder their results. Additionally, a lack of competitive bidding and sufficient peer review will also detract from the quality and quantity of the monitoring undertaken.

For example, GCMRC recently decided to use in-house staff to undertake mechanical removal of trout in Grand Canyon. Bruce Taubert of Arizona Game and Fish Department (AGFD) pointed out to AMP members that “GCMRC may do this at a cost of \$500,000, while AGFD could hire a consultant to do the same work for \$365,000. There would be a savings of \$135,000 that would return money back to the science programs in Grand Canyon.”

Living Rivers Currents 12/01/03

Drought Forecast: Situation Unchanged

A barrage of reports and media advisories continue to come forth from scientists about the persistent drought in the Colorado River basin. The public has been reminded that the region experienced droughts of similar intensity before, notably 1901-1904 and 1953-1956. However, the year of 2002 was singled out as the driest year ever in recent history.

While common forecasting techniques allow for predictions of 3 to 6 months, scientists are beginning to observe two patterns of sea surface temperatures that provide a degree of confidence in predicting long-term droughts, notably the warming of the North Atlantic ocean with the cooling of the tropical Pacific ocean.

By obtaining tree ring data, scientists have reconstructed the climate of past centuries with tested credibility. The analyses of both instrumental and tree ring precipitation records should allow scientists to project drought conditions beyond a mere seasonal forecast. By comparing the data sets, the analyses demonstrate that a drought can persist for one or two decades and, in a few cases, even longer. Additionally, the data can be linked with the aforementioned ocean temperatures and thus provide the indicators necessary to forecast a persistent drought.

In 1998 observers were prompted to anticipate the current drought situation and the conditions remain unchanged and will likely persist into the coming decade. “In the context of shifting ocean climate, the current drought should give water and other resource managers in the Rockies and Southwest little cause for optimism about the drought ending any time soon,” said Julio Betancourt of the US Geological Survey.

In a recent report Betancourt and others stated the implications, "It is always prudent to be conservative about water and other resources vulnerable to drought; it is particularly prudent now. ...Societal demands on surface water are on the increase. ...Clearly, the context for long-term drought is different now than it has been in the past."

Colorado Riverkeeper: All Hands on Grand Canyon

In October, Living Rivers' Colorado Riverkeeper undertook a 12-day science trip through Grand Canyon National Park. Our assignment was to aid in documenting the status of the river's food supply for endangered native fish. Ten volunteers witnessed first hand how the river ecosystem is affected due to climate change.

"Because Lake Powell's reservoir capacity has been reduced by 52%, the chemical and temperature output from the dam is further altering the food web in ways that we have never observed before," said the Colorado Riverkeeper, John Weisheit. Given this recent turn of events in Grand Canyon, Living Rivers and the Colorado Riverkeeper are now devoting the majority of their resources toward mobilizing national support to save what's left of the canyon's native ecosystem. "If the public can't support protection of this world heritage site, there's probably little hope for the rest of the river," concludes Weisheit.

The first obvious observation was a warmer than usual Colorado River. The volunteers knew from experience that the discharge from Glen Canyon Dam normally originates from the chilly depths of the reservoir. While sampling, the volunteers were amazed with the abundant zooplankton found. This indicates that the water used to generate power is coming from the warmer water zone near the reservoir surface, an area containing many exotic life forms, including pathogens and parasites. "It's only a matter of time before these exotic species from Lake Powell become competitors for the available food that endangered native fish must have to survive. This new condition will become a serious issue for the stakeholders of Grand Canyon," said volunteer David Haskell, retired science director of Grand Canyon National Park.

Tatiana Lawson, a river guide from Moab, was intrigued with the organisms now existing in the river. "A flatworm is something I expect to see in my biology class at school," said Lawson, "not in the Colorado River system. But these newly introduced New Zealand Mud Snails are especially worrisome for me. Tiny as they are, by the millions they are effectively over-grazing the river bottom and depleting the food supply."

Joe Shannon, a Northern Arizona University aquatic ecologist who has studied the river's food base for 14 years, supervised the volunteers and staff. "The ecosystem here has changed since I first arrived," remarked Shannon. "This river was loaded with algae called *Cladophora* and an invertebrate called *Gammarus*. Now there is another suite of algal types and *Gammarus* numbers have declined. The flows from Glen Canyon Dam are not managed consistently and consequently the food web is in constant flux." Shannon laments how managers continue to be unresponsive to the sound recommendations of his fellow scientists who support flows that mimic the natural flows of the Colorado River. "They continue to manage the dam for hydropower revenues first, with the management mandates of our National Park coming last," adds Shannon.

"It's unbelievable how bad things are down here in the Grand Canyon," remarked Michelle Harrington, coordinator for the Center for Biological Diversity. "The river ecosystem here has completely changed from its unique and natural condition because of Glen Canyon Dam. If the public was fully aware of this condition, I think they would respond in the same way as they have for protecting the Arctic National Wildlife Refuge, and would demand river management alternatives that include the decommissioning of Glen Canyon Dam."

Living Rivers Currents 12/01/03

Access Denied: No Release of Inundation Maps

The public has no right to know who might be in the flood path should Glen Canyon or Hoover Dam fail. Using national security risks as their trump card, the Bureau of Reclamation was able to convince Judge Tena Campbell to deny Living Rivers' appeal for their inundation maps, effectively ending the 18 month effort to obtain this information.

If Glen Canyon Dam fails an estimated 500-foot wall of water would race through the narrow parts of the Grand Canyon toward Hoover Dam. Even if Hoover Dam withstood the initial impact of the flood, a waterfall over the top would last 11 days and would destroy the water delivery infrastructure and communities downstream.

"The funny thing about all this, is that some of this information is already in circulation, we had just hoped to obtain it through official channels," says Living Rivers' executive director, Owen Lammers.

Until the trial the Bureau's arguments for withholding the information had nothing to do with national security. They now claim this information is exempt from disclosure based on things like arrest procedures, or the design of the President's limousine; something that aids criminals in completing a crime. This is certainly not the case with inundation maps.

Since the 9/11 political scene, the government is using national security as a means to keep information from environmental groups. Living Rivers has been told that this case is being used to equip federal attorneys in fighting Freedom of Information requests. In this political climate Living Rivers does not feel it likely that an appeal would overturn the verdict and is not pursuing the matter further.

'Securing' the Public With Secrets

The News Media and the Law

Published by the Reporters Committee for Freedom of the Press

By Rebecca Daugherty

Judicial deference to the government's widespread claims of national security is keeping unclassified records from public view

Wanting to know what would happen if the Glen Canyon Dam in Arizona burst, a small environmental group filed a freedom of Information Act request in September 2001 for the federal government's projections as to where the renegade waters would go. If the dam should falter, its downstream flow would not only jeopardize the nearby Hoover Dam but waterworks beyond, flooding or destroying communities along the way.

But the Bureau of Reclamation, which creates the "inundation maps" projecting what might happen, denied the request. And in March, the federal district court in Salt Lake City upheld the denial.

Judge Tena Campbell ruled that the government could withhold the unclassified maps under an exemption to the FOI Act for "law enforcement" records because terrorists might make use of the information. One arm of the law enforcement exemption protects

against release of information that might help anyone circumvent the law, which Campbell said applied here.

That decision is one of three since the events of Sept. 11, 2001, that defer to the government's pleadings that "national security" interests excuse agencies from giving out records—even when they cannot use the exemption to the FOI Act that is specifically designed to protect national security, or the other far-reaching protection for national security information, a law that protects intelligence sources and methods.

The first FOI Act exemption only covers records that are properly classified in the interest of national security or foreign policy. To classify records, the exemption requires agencies to follow a set of formal procedures laid out in an executive order.

Yet in these three cases the government has used a "national security" excuse to invoke the law enforcement exemption to the FOI Act, denying information that would have likely been released if the government had not played the "terrorist" card to justify use of the exemptions.

Together they demonstrate the breadth of denials in which national security trumps government transparency due to the tenor of the times. With no end in sight to the war on terrorism, the judiciary's deference to administrative secrecy could conceivably trouble FOI requesters for some time to come.

Photo caption: Unclassified information about what would happen if the Glen Canyon Dam in Arizona burst can be withheld from the public based on the government's claims of national security interests, a federal court in Salt Lake City ruled in March.

Examining the U.S. Customs Service

In 1998, Coastal Delivery Corp. successfully sued a warehouse for breaking a contract that made the trucking company the exclusive carrier of its cargo which had to be delivered to a U.S. Customs Service examination station at the Los Angeles/Long Beach port. But in order to recover damages, Coastal Delivery needed to know how often the agency's contraband enforcement team examined containers.

The company asked for the records in October 2001 for use in its complaint, but never got them. Coastal Delivery brought suit against the Customs Service, and again walked away empty-handed.

Coastal Delivery could not have the information, U.S. District Court Judge Matthew Byrne in Los Angeles wrote in March, because "terrorists and others could use the information to discover the rate of inspection and then direct their containers to vulnerable ports." Knowing where the government is lax in its examinations, Byrne reasoned, might tell terrorists how vulnerable some seaports are.

The parties in Coastal Delivery Corp. v. U.S. Customs Service agreed that the purpose of the request made no difference in determining whether information would be available. A reporter hoping to evaluate how thoroughly the Customs Service checked

containers would also not be able to see the records under this decision, which was not appealed.

Secretly Detained

Twenty-one public interest and human rights groups have petitioned the U.S. Supreme Court to hear arguments that the government should be required to release the names of hundreds of detainees jailed after Sept. 11, 2001.

The Center for National Security Studies, an advocacy and research group in Washington, D.C., has taken the legal lead on behalf of the organizations, including The Reporters Committee for Freedom of the Press, that are suing the government for the records.

In its request for review, the groups wrote the purpose was "to make clear that a national security crisis is no justification for courts allowing the Government to evade so easily its responsibilities under FOIA--and that courts cannot ignore the vital countervailing interests at stake such as the individual rights petitioners here seek to enforce."

For the divided appeals panel in *Center for National Security Studies v. Department of Justice*, decided in June 2003, Judge David Sentelle wrote that the judiciary would defer to the government's expertise in a "national security" probe. The Justice Department is in a better position than the court to know what should be withheld in a terrorism investigation, the judge wrote, in reversing a lower court. His opinion triggered a lengthy and pointed dissent by judge David Tatel.

The majority's approach "drastically diminishes, if not eliminates" the judiciary's role in FOI cases involving national security, Tatel said.

Fighting an Upstream Battle

"If we had gone forward on this prior to 9/11 it would have been a slam dunk," said Owen Lammers, executive director of the environmental group Living Rivers in Utah and Arizona.

What public interest groups throughout the nation are quickly learning, however, is that policies resulting from the never-ending war on terrorism have done significant damage to the idea of public accountability.

Lammers says his organization wanted copies of the Bureau of Reclamation's inundation maps because it hoped to show the value of decommissioning certain dams in Arizona. The structures are inherently unsafe, he said, and they are far more expensive to maintain than to decommission.

To highlight his point, Lammers says the Glen Canyon dam nearly failed in 1983, as rainfall almost caused the reservoirs to top off and spillways were damaged. Because there are a number of dams along the Colorado River, catastrophic failure of one can

affect others. Water from a breached Glen Canyon Dam could flow downstream, flood Lake Mead and possibly breach the Hoover Dam, which holds back the lake.

"It would be quite a scene," Lammers said.

But the government had little interest in allowing Living Rivers to make the projections public. In *Living Rivers v. the Bureau of Reclamation*, the court deferred to the government's claim of national security interests in not releasing the unclassified material. Living Rivers did not appeal, but that does not mean the organization agreed with the rationale.

Photo caption: Environmental groups say the Glen Canyon Dam should be decommissioned, but it's difficult to make a compelling case when public records about the dam are withheld.

Lammers says if terrorists succeeded in breaching a dam of the magnitude of Glen Canyon or Hoover, the inundation maps would have made little difference. The maps, Lammers says, do not show how to carry out an attack on the dam.

"We are trying to point out that a couple of these facilities could fail on their own," he said. "Most states require that inundation maps be public. But the federal government says that it doesn't have to give these out."

Furthermore, says Living Rivers attorney Joro Walker, if people knew the risks, they could better equip themselves against future danger. Instead, notes Walker, the government is saying, "You don't have to worry about it, we have a plan."

Sidebar: Petitioning for Supreme Court Review

The petition to the U.S. Supreme Court by the Center for National Security Studies and others asks the high court not only to find that the government has misused the exemptions to the FOI Act to deny information about the hundreds of people detained since Sept. 11, 2001, but that the First Amendment requires the government to make the information available.

The First Amendment prohibits secret arrests and detentions except in the most compelling circumstances, the groups wrote. In *Richmond Newspapers, Inc. v. Virginia*, the high court first examined what was to become a test for a First Amendment right of access: If the information was traditionally open, and openness served a purpose in democracy, then the First Amendment requires public access to the information.

That test should apply here, the petition says. Public scrutiny is vital, as it is the public's only restraint on the government's awesome power to arrest and detain people in these situations.

Sidebar photo caption: Kate Martin, director of the Center for National Security Studies, argued the FOI Act case before the appeals panel.

In its request for review, the groups wrote the purpose was "to make clear that a national security crisis is no justification for courts allowing the Government to evade so easily its responsibilities under FOIA--and that courts cannot ignore the vital countervailing interests at stake such as the individual rights petitioners here seek to enforce."

For the divided appeals panel in *Center for National Security Studies v. Department of Justice*, decided in June 2003, Judge David Sentelle wrote that the judiciary would defer to the government's expertise in a "national security" probe. The Justice Department is in a better position than the court to know what should be withheld in a terrorism investigation, the judge wrote, in reversing a lower court. His opinion triggered a lengthy and pointed dissent by Judge David Tatel.

The majority's approach "drastically diminishes, if not eliminates" the judiciary's role in FOI cases involving national security, Tatel said.

Fighting an Upstream Battle

"If we had gone forward on this prior to 9/11 it would have been a slam dunk," said Owen Lammers, executive director of the environmental group Living Rivers in Utah and Arizona.

What public interest groups throughout the nation are quickly learning, however, is that policies resulting from the never-ending war on terrorism have done significant damage to the idea of public accountability.

Lammers says his organization wanted copies of the Bureau of Reclamation's inundation maps because it hoped to show the value of decommissioning certain dams in Arizona. The structures are inherently unsafe, he said, and they are far more expensive to maintain than to decommission.

To highlight his point, Lammers says the Glen Canyon dam nearly failed in 1983, as rainfall almost caused the reservoirs to top off and spillways were damaged. Because there are a number of dams along the Colorado River, catastrophic failure of one can affect others. Water from a breached Glen Canyon Dam could flow downstream, flood Lake Mead and possibly breach the Hoover Dam, which holds back the lake.

"It would be quite a scene," Lammers said.

But the government had little interest in allowing Living Rivers to make the projections public. In *Living Rivers v. the Bureau of Reclamation*, the court deferred to the government's claim of national security interests in not releasing the unclassified material. Living Rivers did not appeal, but that does not mean the organization agreed with the rationale.

Photo caption: Environmental groups say the Glen Canyon Dam should be decommissioned, but it's difficult to make a compelling case when public records about the dam are withheld.

Lammers says if terrorists succeeded in breaching a dam of the magnitude of Glen Canyon or Hoover, the inundation maps would have made little difference. The maps, Lammers says, do not show how to carry out an attack on the dam.

"We are trying to point out that a couple of these facilities could fail on their own," he said. "Most states require that inundation maps be public. But the federal government says that it doesn't have to give these out."

Furthermore, says Living Rivers attorney Joro Walker, if people knew the risks, they could better equip themselves against future danger. Instead, notes Walker, the government is saying, "You don't have to worry about it, we have a plan."

Sidebar: Petitioning for Supreme Court Review

The petition to the U.S. Supreme Court by the Center for National Security Studies and others asks the high court not only to find that the government has misused the exemptions to the FOI Act to deny information about the hundreds of people detained since Sept. 11, 2001, but that the First Amendment requires the government to make the information available.

The First Amendment prohibits secret arrests and detentions except in the most compelling circumstances, the groups wrote. In *Richmond Newspapers, Inc. v. Virginia*, the high court first examined what was to become a test for a First Amendment right of access: If the information was traditionally open, and openness served a purpose in democracy, then the First Amendment requires public access to the information.

That test should apply here, the petition says. Public scrutiny is vital, as it is the public's only restraint on the government's awesome power to arrest and detain people in these situations.

Sidebar photo caption: Kate Martin, director of the Center for National Security Studies, argued the FOI Act case before the appeals panel.

RRFW Riverwire - HOW DID WE GET IN THIS MESS?

River Runners For Wilderness is pleased to announce the imminent release of *Hijacking A River, The Political History of the Colorado River in the Grand Canyon*, by Jeff Ingram. *Hijacking A River* tells the whole story of "How did we get in this mess?": A pummeled government agency, intransigent businessmen and their political allies, apathetic environmentalists, and disorganized river runners; these are the characters who have made a mess of Colorado River management in Grand Canyon National Park. From the first steps to usher in a wilderness river to the Goldwater-Garn-Hatch Rider of 1980, Ingram unfolds the activities of such players as Fred Burke, Steve Carothers, Kim

Crumbo, Fred Eiseman, Marvin Jensen, John McComb, Joe Munroe, Bo Shelby, Gaylord Staveley, Sam Steiger, Merle Stitt, Morris Udall, and many others. Surprisingly, a number of the players in the 1970s are still active in today's Colorado River Management Plan revision.

The book follows the changes in Grand Canyon river running from the 1960s onward, while answering all those persistent questions river runners have been asking for over a decade. With humor and wit, Jeff Ingram answers questions like "Why is it the public now waits 13 years for a self-guided permit to raft the Colorado River in Grand Canyon?" The book also clearly spells out why there is no congressional Wilderness designation for Grand Canyon National Park to this day. Step by step, year by year, Ingram tells the "how and why" behind Grand Canyon river concessionaire's seeming lock on river travel in the Canyon.

Colorado River crusader and historian Jeff Ingram has, since 1964, been fighting for the Canyon and the public. David Brower hired Ingram as the first Southwest Representative for the Sierra Club, and together they successfully fought the proposed dams in Grand Canyon in the 1960s. Ingram worked with then-writer/environmentalist Martin Litton for a Grand Canyon National Park Wilderness bill, until Litton turned...but you'll have to read about it in the book! Ingram documented events, meetings, legislative and legal moves and tells us about the on-going battle of protecting the Grand Canyon for the people of the world, with personal interviews and painstaking research from a number of archives.

If you want to truly understand the supercharged issue of Grand Canyon's wilderness designation (the lack thereof), the denial of public boaters access rights to the river in the park, and the politics behind Grand Canyon National Park management, *Hijacking a River* is a must-read.

RRFW is pleased to be able to take advance orders for *Hijacking A River*, 496 pages, including maps, readers guide, and index. The cost of this book is \$20 (\$17.95 each, plus \$2.05 shipping and handling per book), with a tentative shipping date of January 15, 2003. Checks or money orders only please. Advance book sales will benefit River Runners For Wilderness, a not-for-profit organization seeking equitable access to a wilderness river running experience in Grand Canyon. Please send your order to

River Runners For Wilderness PO Box 17301 Boulder, CO, 80308-0301

If you'd like to place an order for that special Christmas someone, just let us know with your order and we'll send an announcement card before Christmas, letting them know they will be receiving a gift from you soon.

RRFW Riverwire - CRMP STAKEHOLDER WORKSHOP VIDEOS AVAILABLE

Grand Canyon National Park is making available to the public the audiotapes from the general session of the stakeholder workshop in June 2003, and the videotapes from the stakeholder workshop in January 2003. The costs for these products covers the duplicating and shipping cost. It will be \$28 for the videotapes. Audiotape prices are not yet available. The order form for the videotapes is below. If you are interested, contact Julie Graham at BJ Communications, (602) 277-9530, ext 229, or julie@bjc.com. If you would like to purchase a copy of the expert panel series and/or the stakeholder workshop for the Colorado River Management Plan revision, please fill-out the form below and send it along with a check or money order for the appropriate amount to:

BJ Communications Attention: Julie Graham 340 East Palm Lane, Suite 280 Phoenix, AZ 85004. If you have any questions, don't hesitate to contact Julie at 602-277-9530 ext. 229 or julie@bjc.com.

Name: Organization: Address (where tapes should be mailed): City, State, Zip: Phone:
Email: Please check the box to indicate the event/s you would like to purchase.

*****Expert Panel: Carrying Capacity, Group Size and Seasonality Wednesday, January 29, 2003 [] VHS Cost: \$28.00 includes tax and shipping

*****Expert Panel: Allocation of Recreational Use Among User Groups Friday, January 31, 2003 [] VHS Cost: \$28.00 includes tax and shipping

*****Stakeholder Workshop Thursday, January 30, 2003 [] VHS Cost: \$28.00 includes tax and shipping TOTAL COST: \$_____

Thank you for your interest in the Colorado River Management Plan revision process. RRFW thanks Mary Orton, mary@maryorton.com for the above information. ###

RRFW Riverwire - PARK FREEZES ADDITIONS TO WAITING LIST!

Grand Canyon National Park News Release
For Immediate Release December 9, 2003 Dawn O'Sickey

Hold Placed on Adding Names to Noncommercial River Permit Waitlist

Grand Canyon, AZ - Grand Canyon National Park is placing a hold on adding new members to the noncommercial river permit waitlist. As part of the current Colorado

River Management Plan (CRMP) planning effort, park staff and planners are carefully examining and considering alternatives to the current waitlist permit system. An overwhelming majority of public comments stated the opinion that the permit system should be overhauled. With this in mind, park management does not want to perpetuate the current system while other alternatives are being considered. There are now over 8,000 people on the waitlist, and more than 1,000 are typically added each year. In the event that the current system is selected as part of the final CRMP decision, to be completed by December 31, 2004, the system for allowing additions to the waitlist would simply be reinstated.

Until a record of decision is made for the CRMP, current waitlist members will be served in the same manner as they have been in the past. They will soon receive the familiar annual letter regarding waitlist procedures, the schedule of release dates, and other topics. The River Permits Office may be contacted at 1-800-959-9164 or 928-638-7843.

Please go to www.nps.gov/grca for more information regarding Grand Canyon National Park. Information about the Colorado River Management Plan may be found at www.nps.gov/grca/crmp.

River News 12/14/03

RRFW Riverwire - LAKE MEAD UPDATE

Lake Mead elevation is currently at 1140 feet, having dropped 14 feet since March, 2003. The lake is forecast to drop to 1129 feet by June, 2004, subject to the winters snowfall and outflow requirements to California, Arizona and Nevada. Lake Mead full pool elevation is 1220 feet.

Colorado River current continues to flow past Boundary Point, as the sediment cone and river channel pushes out into Iceberg Canyon. End of current is now at North Howland Cove, roughly half way through Iceberg Canyon. The channel runs down the west side of Iceberg Canyons western cliffs. The Lake is still 90 feet deep at Devils Cove, just above Sandy Point. The river may be fairly clear at Separation Canyon (River Mile 240), but becomes more turbid by Burnt Spring, so much so that by Columbine Falls the river is brown with moving silt. There are lots of beach areas to camp on below South American Point, downstream of Pearce Ferry. Hydraulics at Lava Point continue but no rapid has formed there yet.

The upper rapid by Pearce Ferry has cut into the right river bank sediments. The run here is to the right, with exposed rock on the left. The lower riffle still has a strong eddy on the right and a strong wave train. A new sandbar has formed on river left below the lower riffle, and river runners will need to go to the right of this sandbar. Pearce Ferry will remain closed to all boating into the foreseeable future due to low reservoir levels.

Sandbar Alley, an area of shallow water with many sandbars, is now extending from just below the Bat Caves upriver to Mile 253, but there are several sandbars above that up to Surprise Canyon. Dry Canyon corner has a large bar on river right that extends all the way down to the Bat Caves. The current is on the left. There are lots of sandbars in the channel near the Oriental Tours boat landing. Just upstream of there, at Burnt Canyon, there is a big bar on the left, and just above that there is a large bar on the right. There is good access to the Burnt Canyon campsite, with a big sandbar ½ mile above that on the right.

South Cove is not going to be impacted by the draw down this year and remains open. All river runners taking out at South Cove are supposed to use the gravel area on the south side of the concrete ramp. River runners are asked to be patient in the de-rig area as Hualapai, concessions and public rafters are all taking out in the same area. River runners are encouraged to maintain as small a take-out footprint as possible, and try to de-rig as quickly as possible. Early take-outs are recommended in the high use seasons of late spring, summer and early fall, to avoid late afternoon river traffic. Maintenance work on the South Cove asphalt ramp has been completed. Dumpsters at South Cove are not for downriver use at this time per trip permit regulations.

National Park Service Rangers note that no camping is allowed on the South Cove ramp and take-out area, or the public swimming area just north of the concrete ramp. Camping is allowed outside the harbor area, and is available one-quarter mile downstream (south) of the concrete ramp below the rock jetty just downstream of the take out. The Mead View Scat machine is closed for the winter, and will tentatively re-open in March.

River News 12/15/03

RRFW Riverwire - Commercial Bookings Continue as NPS Freezes Public Access

On December 9, 2003, Grand Canyon National Park announced it will no longer allow the public to seek boating permits for the Colorado River. River Runners For Wilderness Co-Director Jo Johnson called the move "shocking and premature. Now people wishing to reserve a future trip are forced to use expensive commercial services as they can no longer add their names to the permit list. The Park Service cites the failure of the current system without offering any remedies for public relief except the option of purchasing access from a park river concessionaire."

Grand Canyon officials noted that an overwhelming majority of public comments requested an overhaul of the present permitting system, and offered this as their reasoning for disallowing new applicants to the non-commercial permit system to float

the canyon. "Granted, Grand Canyon National Park has a serious problem with the non-commercial permit system," says Johnson. "Our own review of the public comments has shown that an overwhelming majority of the public would like to see the access methods and allocation between the public and the river concessions changed. There is a backlog of 130,000 people already waiting years to raft the canyon without paying the high concessions fees. So why add fuel to that fire?" says Johnson, who is quick to point out that "We want the Park to be thinking about changing the access and allocation method to one that reflects real public demand and shows no favoritism."

Johnson brings up another point: "Freezing the waiting list removes an indicator of public demand for river trips, the only indicator NPS has. Now the park has no way of measuring demand at all. Vigorous advertising by commercial operators to fill trips and lack of demand for those same trips-many of which have gone unfilled the last few years-indicates an oversupply in their allocation. This is in stark contrast to the multi-year wait those 130,000 paddlers face.

One solution for the park that would be responsive to public demand is to introduce a Universal Permitting system. The trip leader gets a permit, then uses whatever commercial services they desire once they have a permit. "We look forward to the park's soon-to-be released draft alternatives for the Colorado River Management Plan" says Johnson, who points out that "If the park does not put forward the idea of an allocation free concept along with other possibilities, then this freeze is a signal that the future of access to our National Parks is in serious jeopardy."

"The Park has given no indication of what will replace the waiting list for public access" notes Jeff Ingram. Ingram's new book on the politics of access to the Colorado River in Grand Canyon, titled *Hijacking A River*, details how the current problem developed. "The Park started with a First-Come, First-Served system after 92% of the river access was assigned to the commercial operators. The public didn't like that, so the Park used a lottery from 1976 to 1980. This also failed. The Park then started the waiting list. It doesn't work, either, but the 20-year stagnated "status quo" of river management has not changed. Given the Park's attempts at various access systems, we are hoping the park releases a robust spectrum of alternatives, including a Universal Permit system, to get a serious public discussion as a basis for a sound access method."

"Trip opportunities are only open to anyone with the thousands of dollars needed to buy seats on commercial trips, but forbidden to anyone wishing to do it on their own." said Tom Martin, also with River Runners for Wilderness. "This commercialization of our parks is a chilling trend we have seen in this administration, with similar moves at Yellowstone National Park toward privatization of access."

Martin notes that allocations, if they exist at all, need valid indicators of demand so that allocations can shift yearly as needed. "We have heard that the river concessions had 18 trips worth of unused allocation this season. While we are glad to hear that the park will be transferring these unused commercial trips to public boaters for use this winter and next spring, we are amazed that the park does not immediately shift some allocation from the 14 river concessions back to the public. Given the public's huge

backlog, if this isn't a clear indicator that the current management system is a failure, and not reflecting real demand, I don't know what is."

River News 12/17/03

RRFW Riverwire - Park Turns 18 Unused Concessions Launches Over To The Public

Officials at Grand Canyon National Park confirmed today the release of 18 additional launches to perspective permittees on the Park's non-commercial waiting list. These permits have been made available as a result of the 2002 lawsuit agreement between Grand Canyon Private Boaters Association with others, and Grand Canyon National Park. The settlement stipulates that unused summer commercial allocation will be turned over to non-commercial launches for the following off-peak season. The dates are limited to the spring of 2004 season: March 1, 3, 4, 7, 10, 11, 13, 15, 18, 20, 23, 26, 29, 31 and April 3, 6, 7, 8.

According to the Continuing Interest Newsletter mailed December 16, 2003 to those on the non-commercial waiting list, during the week of January 5, 2004 to January 9, 2004, the River Permits Office will be releasing 18 launch dates through the cancellation line. Those with a waiting list number assignment of 03#00001 to 03#01499 may call in on Monday, January 5, those with numbers from 03#00001 to 03#02999 may call in on Tuesday, January 6, those from 03#00001 to 03#04499 can call on Wednesday, January 7, those with a number of 03#00001 to 03#05999 on Thursday, January 8, and those holding any number may call on Friday, January 9. Call the River Office cancellation line between 8:00 a.m. to 12 noon and 1 p.m. to 5:00 p.m. at (928) 638-7883. Launch dates will be given out on a first call, first served basis to eligible callers.

The letter goes on to note that many winter launch dates released in past years were not claimed until the very last call-in day. Provided this trend continues, callers who are eligible to call in the first few days should have a good choice of available dates.

The newsletter assures current waiters on the list that their position on the list is not affected by the recently announced hold on new additions to the non-commercial permit waiting list.

Park officials also noted that self guided trip scheduling during the normal year has included a 12% overbooking of non-commercial river trips. This overbooking has all but

eliminated the need to release additional launches to the cancellation line, while assuring self guided river trips used all the available user days each season.

Our thanks to Steve Sullivan, Grand Canyon National Park, for this information.

River News 01/04/03

RRFW Riverwire - EXPERT PANEL AND STAKEHOLDER WORKSHOP DATES SET

The dates, times and locations for the next step in the Colorado River Management Plan have been announced. This step will involve stakeholder workshops and expert panels. The stakeholder workshops will cover the noncommercial trip permit system, and the spectrum of services to be provided to the public. Certain designated attributes (e.g. flexibility, simplicity, fairness, etc.) of a permit system and types of services will be rated against each other to understand what different segments of stakeholders consider to be important considerations. The Park and its CRMP contractor, SWCA, will use this expanded information in addition to scoping comments already received to craft the new CRMP.

The original concept included 10 designated stakeholder groups. Each group was to be comprised of 4 stakeholder representatives. These representatives would then participate in each of the interactive workshops. Some of the 10 stakeholder groups identified for inclusion were: non-commercial boaters, river outfitters, commercial clients, outfitting guides, wilderness groups, scientists, Native American Tribes, and ecological groups.

River Runners for Wilderness (RRFW), the Grand Canyon Wilderness Alliance, business interests and other stakeholders have voiced concerns about a lack in depth of the representation of the non commercial segment at the stakeholder workshops. While commercial boating stakeholder groups include river concessioners, commercial passengers, and river guides for a total of 12 stakeholder seats, non commercial boaters who include permit holders, passengers, non-commercial river running advocate groups and non-commercial support services all vied for a total of 4 stakeholder seats. Mary Orton, the contractor arranging these meetings, has acknowledged the noncommercial community may be underrepresented and is exploring options to address this concern raised by RRFW.

The expert panels' topics will cover allocation of user days among user groups--sure to be a lively topic--as one, and physical, social and ecological carrying capacity, group size and seasonality of recreational use of the river for the other discussion.

All expert panels and stakeholder workshops will be held at the Arizona State Capitol building in the Governor's Protocol Room, 1700 West Washington, in downtown Phoenix, and video-conferenced to a room--as yet unspecified--at Northern Arizona University in Flagstaff.

Expert Panel #1 will be held on Wednesday, January 29, 2003 from 2:00pm to 5:00pm and 6:00pm to 9:00pm. The two Stakeholder Workshops will be held Thursday, January 30, 2003 at times to be announced. The second Expert panel will held on Friday, January 31, 2003, and be from 8:00am to 11:00am and 1:00pm to 4:00pm. In addition, the sessions will be videotaped and made available to interested persons not able to attend the Arizona meetings.

All events will be open to the public, and the Expert Panels will allow for questions by the audience. More information will be coming your way as it is made available.

Take Action 01/22/03

Join Living Rivers to Save Grand Canyon Fish, January 28-29

The Glen Canyon Dam Adaptive Management Program (AMP) will be holding its next meeting Tuesday, January, 28 and Wednesday, January 29 in downtown Phoenix. For the past year, Living Rivers has been encouraging the AMP to be more aggressive in its efforts to bring about the recovery of endangered native fish in Grand Canyon National Park. Unfortunately, the AMP continues to drag its heels, so the plight of native fish in the Canyon continues to worsen. Humpback Chub populations have declined 80 percent to just 2,000 adult fish. Razorback Suckers have now joined the Bonytail, Roundtail Cub and Colorado Pikeminnows on the extinction list. Take some time to lend your voice to call for more urgent action!

RRFW Riverwire – GRAND CANYON RELEASES AIRCRAFT NOISE STUDY

The National Park Service at Grand Canyon has released a report titled, Aircraft Noise Model Validation Study, dated January 2003. The report completes a study to determine which of four computer models best calculates tour aircraft audibility in the Grand Canyon. The results of the study are important because computer models are the only practical means to assess progress in meeting the requirements of Public Law 100-91 to substantially restore natural quiet at Grand Canyon National Park. Audibility is the measurement used to define substantial restoration of natural quiet. The report was prepared by Harris Miller Miller & Hanson Inc., a leading acoustics consulting firm, for the National Park Service.

In the report, which can be found on the park's website at www.nps.gov/grca, and its attached appendices, the reader will find a detailed step-by-step description of all methods, data, and results of the study. This is a highly technical scientific report prepared by experts primarily for experts. Readers are strongly encouraged to start with the Executive Summary and Study Summary at the beginning of the report.

As detailed in the report, the study methodology was developed by consultant firms with comments, advice, and review by staff from federal agencies and a team of recognized experts in acoustics, statistics and scientific methods. In the Acknowledgements section, however, the authors carefully point out that the final interpretations and words in the report are those of the authors, Harris Miller Miller & Hanson Inc., and not those of any of the other study participants.

For additional information regarding this report, please contact Dr. Kenneth Weber, Grand Canyon Science Center, at (928) 638-7753 or Maureen Oltrogge, Public Affairs Officer, at (928) 638-7779.

Maureen Oltrogge Public Affairs Officer Grand Canyon National Park (928) 638-7779

Canyon's Recovery Must Rest on Science

The Arizona Republic OpEd

The Republic's January 19 editorial "Fish fight: saving chub must be more than just killing trout" is a good introduction to the plight of our state's most valuable natural wonder, the Grand Canyon. However, continuing to allow the Glen Canyon Dam Adaptive Management Program (AMP) to control the Grand Canyon's fate, as the Republic recommends, will only speed the current death spiral of the canyon's native ecosystems.

From its inception, the AMP has opposed implementing U.S. Fish and Wildlife Service recommendations to mimic the Colorado River's natural flow regime, thereby propping up the Grand Canyon ecosystem. Ninety-five percent of the vital sediment and nutrients that would be deposited by a free-flowing river system are now trapped behind Glen Canyon Dam. Without sediment deposition, species go extinct and beaches for mammals, native vegetation and human recreation erode away. Four native fish species have already disappeared, along with river otters, muskrats and every single native insect species that formed the base of the food chain. Yet the AMP has proposed no viable plan for moving the necessary amounts of this sediment into the Grand Canyon.

Instead, AMP has undertaken a handful of experiments to try to build beaches by moving around the meager sediment that deposits downstream of the dam. The result of AMP's efforts to date is a precipitous eighty percent decline in the humpback chub population--the principle endangered fish species AMP is supposed to be recovering.

Because of these declines the AMP is now considering stocking the Grand Canyon with hatchery fish. This is not recovery. This is a zoo. Recovery implies self-reproducing native populations, not manufactured fish which cannot reproduce and which must be constantly restocked as they die off in their unnatural and inhospitable habitat.

Had the AMP been dominated by science as was presumably intended, it might have been a worthy process, capable even of achieving its objective. The AMP boasts stellar scientists producing good ideas for restoring the Canyon. Scientists, however, have taken a backseat to AMP politics, restricting recommendations to those that are politically acceptable, else risk having AMP's funding cut.

Dominated as it has become by state water engineers, industrial irrigators, and hydroelectric merchants, the AMP has been unwilling to support the changes in Glen Canyon Dam operations necessary to reverse Grand Canyon's ecological decline. The AMP players that are truly concerned with environmental restoration are simply politically outmuscled by those who wish to retain the status quo of abusing the Colorado River system for water and energy profits.

While society has an array of technologies to meet water and energy needs, we have only one Grand Canyon. If this natural wonder is going to be protected, the AMP must be replaced with a purely scientifically-based advisory panel. Its first task must be to produce an Environmental Impact Statement considering a full range of alternatives for Glen Canyon Dam operations, including those which will be truly effective in recovering Grand Canyon's native habitats. Only through such unbiased research and recovery programs driven by scientists rather than politicians will Grand Canyon's ecosystem have any hope of salvation.

The AMP participants convene here in Phoenix this week. At the January 2002 AMP meeting, the environmental group Living Rivers exercised their right to become involved in this taxpayer-funded process by presenting a document requesting some specific definitive actions on behalf of the collapsing Grand Canyon ecosystems. A full year later AMP leaders have still not replied. Arizonans, this is our Canyon, our tax dollars and our opportunity to demand results. Attend the AMP meeting this year and insist on real protection for the Grand Canyon.

RRFW Riverwire – COMMENT ON PWC USE IN GLEN CANYON NRA

This is a second comment opportunity on proposed PWC use in Powell Reservoir. The Bush Administration has proposed a rule which allows personal watercraft (PWC) operation on nearly all of Glen Canyon NRA. The ruling was published on January 17th. The administration made this decision despite the fact that the NPS' recent environmental review of PWC use at Glen Canyon found that the thrillcraft damage park resources and wildlife.

Also, there is a disproportionate acreage of the NRA open to PWC use, which is simply unfair to the majority of visitors who come to the recreation area to enjoy more contemplative forms of recreation like swimming, hiking, fishing, canoeing, kayaking, and wildlife viewing. The ruling comes despite continued overwhelming comments against personal watercraft (Jetski®) use at the National Seashore and various Parks, including Glen Canyon National Recreation Area.

PWC recreation causes significant damage to air and water quality, visitor enjoyment, public health and safety, natural soundscapes, and wildlife. At Cape Hatteras, PWC operation was the number one source of visitor complaints before the machines were finally banned there. In some instances, PWC activity and its proven threat to personal safety pushes other forms of recreation such as swimming or bird watching off a waterbody.

This is discriminatory. If you feel a full ban on PWCs in Glen Canyon NRA is the only appropriate action, please send your comments to Kitty Roberts, Superintendent of Glen Canyon National Recreation Area, and tell her that you support protecting the irreplaceable resources and wildlife of Glen Canyon from personal watercraft.

Letters should be sent to glca_pwc@nps.gov or to the address below. Superintendent Kitty Roberts Glen Canyon NRA PWC Rule-Making Box 1507 Page, Arizona 86040 RE: RIN 1024-AC90, Comments on Draft PWC Special Regulations Had a close call or negative experience with PWCs after an otherwise idyllic Cataract Canyon trip? Include that in your letter to Supt. Roberts, along with other personal observations.

RRFW Riverwire - LAKE POWELL DRAINED 50%

LAKE POWELL DRAINED 50%--FOUR YEARS TO GO! MARINAS LEFT HIGH AND DRY, CONCESSIONAIRES CONTEMPLATE PULLING OUT

Lake Powell reservoir is down 86 feet from normal, equating to a reservoir that is half full. The National Park Service, which manages marina facilities at Lake Powell, is busy trying to make adjustments with the hope that they can still accommodate visitors at some locations. Meanwhile, the recently approved \$70 million Antelope Point Marina project is in jeopardy of never being used.

Now in the fourth year of an anticipated sustained drought, Lake Powell reservoir will soon be empty. Forecasters have informed the Park Service that the reservoir levels will only be getting lower. The reservoir is dropping faster than it can be replenished. Even when the snow begins to melt this spring, the reservoir is not expected to rise any higher than where it is right now. By July, the reservoir will again start dropping.

The United States Geological Survey 2002 report on Southwest climate change predicted that the Colorado Plateau would be heading into a 30-year period of below average river flows. Previous estimates by forecasters, on the impacts of such a sustained drought, calculated that Lake Powell would be drained within eight years. It's right on schedule. In July 1999, Lake Powell was at 90 percent. As of February 1, 2003, it was at 50 percent.

If the present drought does not relent, Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam. According to a model that was published in October of 1995 in the Water Resources Bulletin, if a severe and sustained drought similar to the drought of the late 16th century appears, Lake Powell could stay drained for eight years.

"We're witnessing the end of Lake Powell right now," says Living Rivers' Conservation Director John Weisheit. "This was predicted, and nothing the National Park Service or the marina operators can do will change this."

o At present three of the concrete boat ramps have been closed: Antelope Point, Stateline and Hite Marina. For Stateline, the concrete ends where the wet sand and mud begins; it was officially closed on February 3. For Hite Marina, river sediment closed the concrete ramp and an alternative ramp on gravel began in the autumn of 2002. This alternative ramp too is now closed due to sediment fill from the Colorado River. Antelope Point's ramp was the first ramp to close last year, just three years after construction in 1999.

o A \$3 million emergency appropriation was made in January to extend boat ramps at Bullfrog, Hall's Crossing and Wahweap marinas. It is unclear, however, how far these ramps will be extended, or if additional funding will be sought to extend them all the way to the bottom as levels continue to drop.

LR Press Release 02/04/03

Living Rivers Welcomes New Outreach Coordinator

High-Profile Environmental Group Hires Outreach Coordinator To Target Colorado River Delta Issues as Drought Situation Worsens

As declining reservoir levels and water scarcity concerns multiply across the state and into Mexico, Living Rivers is pleased to announce the arrival of Michelle Pulich Stewart to the Arizona office, based in Scottsdale.

Before joining Living Rivers, Ms. Pulich served in a variety of non-profit, academic and government roles pertaining to resource management and habitat restoration, including: Lady Bird Johnson Wildflower Center, Texas Parks and Wildlife Dept, Maricopa Community Colleges, Sierra Club, Center for Biological Diversity and Sierra Madre Alliance.

"I'm pleased to be bringing both my research and on-the-ground organizing experience to the mounting ecological crises and restoration needs of the Colorado River here in Arizona and across the border into Mexico," says Ms. Pulich. "Even should drought conditions persist, there is more than enough water to meet the state's human and ecological needs, but the public has not been exposed to the river management options available to achieve such a balance. I look forward to helping make that happen," adds Ms. Pulich.

Her formal education includes both a B.A. from Rice University and a Master's degree in Environmental Resource Management from Southwest Texas State University, although she has found, streambeds, canyons, prairies, and prescribed burns to be striking repositories of knowledge.

"We are certainly excited about adding Michelle to our team," says Lisa Force, Living Rivers' Program Director. "Her teaching experience and activism history will be valuable

assets to our efforts to bring about sustainable Colorado River management here in Arizona as well as delta restoration."

Ms. Pulich also enjoys backpacking, yoga, gardening, and of course, floating down rivers. Ms. Pulich will be married to Alex Stewart in late May of this year.

Living Rivers works to mobilize people to protect and restore the integrity of rivers and watersheds.

LR Press Release 02/04/03

Lake Powell drained 50%--four years to go!

Marinas Left High and Dry, Concessionaires Contemplate Pulling Out

Contact:

John Weisheit (435-259-1063 or 435-259-8077)

Lake Powell reservoir is down 86 feet from normal, equating to a reservoir that is half full. The National Park Service, which manages marina facilities at Lake Powell, is busy trying to make adjustments with the hope that they can still accommodate visitors at some locations. Meanwhile, the recently approved \$70 million Antelope Point Marina project is in jeopardy of never being used.

Now in the fourth year of an anticipated sustained drought, Lake Powell reservoir will soon be empty. Forecasters have informed the Park Service that the reservoir levels will only be getting lower. The reservoir is dropping faster than it can be replenished. Even when the snow begins to melt this spring, the reservoir is not expected to rise any higher than where it is right now. By July, the reservoir will again start dropping.

The United States Geological Survey 2002 report on Southwest climate change predicted that the Colorado Plateau would be heading into a 30-year period of below average river flows. Previous estimates by forecasters, on the impacts of such a sustained drought, calculated that Lake Powell would be drained within eight years. It's right on schedule. In July 1999, Lake Powell was at 90 percent. As of February 1, 2003, it was at 50 percent.

If the present drought does not relent, Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam. According to a model that was published in October of 1995 in the Water Resources Bulletin, if a severe and sustained drought similar to the drought of the late 16th century appears, Lake Powell could stay drained for eight years.

"We're witnessing the end of Lake Powell right now," says Living Rivers' Conservation Director John Weisheit. "This was predicted, and nothing the National Park Service or the marina operators can do will change this."

- At present three of the concrete boat ramps have been closed: Antelope Point, Stateline and Hite Marina. For Stateline, the concrete ends where the wet sand and mud begins; it was officially closed on February 3. For Hite Marina, river sediment closed the concrete ramp and an alternative ramp on gravel began in the autumn of 2002. This alternative ramp too is now closed due to sediment fill from the Colorado River. Antelope Point's ramp was the first ramp to close last year, just three years after construction in 1999.
- A \$3 million emergency appropriation was made in January to extend boat ramps at Bullfrog, Hall's Crossing and Wahweap marinas. It is unclear, however, how far these ramps will be extended, or if additional funding will be sought to extend them all the way to the bottom as levels continue to drop.
- Potable water is becoming a problem at Hite Marina. The site draws its drinking water directly from the reservoir, treats it and then stores it in tanks for consumption. But the intake buoy is about to go aground and needs to be extended into deeper water. Besides being expensive to modify the intake, there is no assurance that deep water can be maintained as Lake Powell's delta continues to advance beyond the bay at Hite.
- The planned marina at Antelope Point will find a 500-foot cliff being exposed where the second launch ramp is proposed. Calls to Antelope Point Holdings and their engineers, revealed no comment to the feasibility of the project. According to the National Park Service, construction was supposed to begin in March, but it has now been delayed to at least May.
- The problems at Hite Marina are causing the concessionaire, Aramark, to question whether they should shut their Hite operation down altogether. To preserve the marina may require moving it, a cost Aramark may not wish to incur. No decision has yet been taken. With visitation through Glen Canyon National Recreation Area dropping by 10 percent per year, Aramark may be looking to pull out of the other marinas as well.
- The fate of the white-water rafting industry, which concludes trips at the top of Lake Powell, is also a major question. With sediment and mud clogging the marina and boat ramp at Hite, rafters will have a very difficult time getting off the water.

"As the drought persists, it is going to be very difficult, if not impossible, to conduct business as normal with the river and reservoir users. This includes the Grand Canyon river runners who will lose the large Glen Canyon Dam releases they need to run their large motorized boats through the canyon only to arrive at the sediment-choked Lake Mead," adds Weisheit.

Lake Powell is not the only problem. The entire Colorado River storage system has dropped from 92 to 60 percent over the past 40 months. "Lack of access to flat water recreation is the least of our worries," concludes Weisheit. "The Southwest plumbing

system is headed for complete catastrophe, and the Bureau of Reclamation and the seven states that use Colorado River water have no disaster preparedness."

RRFW Riverwire – NO WILDERNESS BILL WITHOUT THE RIVER

WILDERNESS COALITION DISCOURAGES LEGISLATION By Brad Fuqua Grand Canyon News Editor Sunday, February 02, 2003

As the next phase of the Colorado River Management Plan process gets ready to begin today in Phoenix, the Arizona Wilderness Coalition believes there could be something happening behind the scenes in Washington. Kim Crumbo, Grand Canyon regional coordinator for the Arizona Wilderness Coalition and former National Park Service river guide, said the federal agency's congressional liaison office in Washington has wilderness designation legislation on its docket, although "not signed off."

"The only way a wilderness bill would pass this Congress is to eliminate the river from wilderness consideration or grandfather in motorize use," Crumbo said Thursday. "All this should take place in the planning process ... why the Park Service is considering wilderness legislation at this time makes us suspicious. We're asking them to just pull it; let's wait until the appropriate time."

Grand Canyon National Park sources, including CRMP planning leader Rick Ernenwein, said they were not aware of any legislative activity in Washington. Therefore, they could not comment on AWC's information.

In a press release dated Jan. 22, the AWC claims the potential legislation "could blindside the American people with a 1.1-million-acre wilderness proposal that removes the Colorado River from wilderness protection, thereby ensuring continued ecological damage from large crowds and pollution from motors." "We just want all that to stop until the public involvement process is completed," Crumbo said. "It's inappropriate to be pursuing this before the public process runs its course."

The AWC supports recommendations to not decrease use on the river, but spread it out over a longer time period while eliminating motors. At the same time, Crumbo said commercial allocations could remain the same while the cost of a river trip could become more affordable and available to more people.

River outfitters have a different set of recommendations on the issue to support their beliefs and Crumbo said they "have the best arguments." "We'll see what transpires," Crumbo said. "It should go on for another full year." In the meantime, the AWC planned to encourage people to attend this week's expert panels and workshops in Phoenix and Flagstaff.

RRFW Riverwire – LAWSUIT FILED TO START DESCHUTES COMMON POOL

A group of Deschutes River users filed suit Thursday, February 13th against Oregon's Department of Parks and Recreation (OPRD) and director Mike Carrier. The suit contends that the OPRD has violated Oregon law with its current role and stance in delaying implementation of a "common pool" permit system, that provides equal access to all, as called for in the Lower Deschutes River Management Plan (LDRMP). The motion was filed by the Northwest Rafter's Association (NWRA), and Mark Shuholm representing the general public. This action is also being supported by National Organization for Rivers (NORS), River Runners for Wilderness, and the American Canoe Association (ACA).

The Plaintiff's position is that full implementation of the LDRMP will insure the greatest level of access to the Deschutes River by the general public for generations to come. A failure to immediately implement the LDRMP, as currently written and required by Oregon Law, jeopardizes future access by the general public to this public resource.

Under the guidelines of Oregon State Statute ORS 390.934, the LDRMP and its supplement were developed over several years with input from the OPRD, BLM, The Confederated Tribes of the Warm Springs Reservation, other government agencies – as well as the general public. The Lower Deschutes River Management Plan was finished in 1993 and the supplement in 1997. Both the LDRMP and the supplement were adopted by the OPRD under administrative rule OAR 736-040-0070. The LDRMP and its supplement call for implementation of a limited access "common pool" permit system once certain trigger levels of use have been reached for various segments of the river. A "common pool" system offers equal access to all parties – without preference given for any specific group or interest. If and once these trigger levels of use are reached for any year, then a "common pool" permit system is to be implemented the following year. Levels of use that would trigger implementation of the "common pool" permit system were reached in 1997, 1998, 1999, 2000, 2001, and 2002. Although the LDRMP has therefore called for implementation in each of the years 1998, 1999, 2000, 2001, 2002, and 2003, the OPRD has not taken the legally required action relating to implementation of the system.

Further, the OPRD is currently promoting an agenda counter to that outlined by the LDRMP. At a November 14th meeting of managers from the various agencies, the OPRD proposed a 3 year further delay in implementation of the "common pool" permit system - as well as re-introducing the topic of a "split allocation" permit system - a system that would guarantee access to commercial interests by limiting access to the general public.

The Suit asks that the OPRD be found to have unlawfully refused to act and unreasonably delayed taking action in implementation of the LDRMP - and that the OPRD be compelled to implement the "common pool" permit system for the 2003 season.

LR in the News 02/16/03

From panic to denial on water: Reactions to crisis disparate in Four Corners states' plans

By Michael Booth

Denver Post Staff Writer

Sunday, February 16, 2003 - The multiyear drought in the Four Corners states has brought sacrifice to some cities and recreation areas, and a mere shrug of the shoulders from others.

From Salt Lake City to Aurora, and Albuquerque to Phoenix, water managers and their constituencies react to the absence of snow with the full range from panic to denial. Some scramble to prop up reservoir levels at all costs; others argue the definition of "reservoir" is a bank of water that gets drawn to zero in dry times.

Phoenix will exhaust its local reserves this summer.

Yet Rocky Mountain snowmelt coming down the Colorado River means the largest city in the Southwest has no lawn-watering curbs. Well-soaked residents even plant a winter variety of seed over their dormant summer bluegrass to ensure green color all year.

At half-full Lake Powell, the water playground for millions of Westerners, boaters this summer might want a taxi to get from the marina to the fast-receding Colorado River water. But the lucrative tourist season looms, and National Park Service officials contemplate blowing up a rock formation uncovered by the drought at the Arizona end so this summer's demanding boat traffic can avoid a 7-mile detour.

The Southwestern approach to drought is "definitely head-in-the-sand," said Owen Lammers of Utah-based environmental group Living Rivers, which is sharply critical of how federal dams and what it calls greedy cities rearrange Western water flows. "We're

characterizing this as the Enron of water management. The government keeps saying lake levels will get better, and the reality is that things are going down, down, down."

The wide variance in public water restrictions can deflate conservation efforts by prompting complaints of unfair treatment and downstream waste, water experts said. And even if downstream draws from the Colorado River are legal, they may injure streams or lakes in a way that everybody has to pay for in the future.

"The river that many of these states depend on is being overtaxed, so despite what your rights are, there are reasons here to be concerned," said Bart Miller, water projects director for Land and Water Fund of the Rockies. "It strikes the average citizen as unfair or strange when others are using much, much more water."

Cities with looser water policies defend the lack of rules as a benefit of well-secured supplies.

"All these decades of planning for water resources and storage have paid off," said Ken Kroski, spokesman for the Phoenix water supply, where the main reservoir for the perpetual boom city is down to 14 percent of capacity. As Aurora tells people they can't plant a single flower this spring, and Denver ponders a year-round shut-off of lawn sprinkling, Phoenix is still in Stage 1 of its drought plan, asking for voluntary 5 percent cutbacks in home water use with no rules for what days to water.

Knowing there will be no water available from Arizona snowmelt or rain this summer, Phoenix is confident its share of Colorado River water coming down the cement channels of the Central Arizona Project will be more than enough for city lawns in 2003.

Checking in with other cities shows just how disjointed Western water policy can be - while Denver, Phoenix and Salt Lake City watch their reservoirs drain, Albuquerque will switch from more predictable well water to a new reservoir system over the next three years.

Santa Fe drivers can't drive through a car wash more than once a month. Tourists to the high- desert jewel won't get their hotel sheets changed until their fourth day.

Currently in Albuquerque, "when it's dry, we just pump more from the aquifer," Mayor Marty Chavez said. "But we're depleting the aquifer. We can get away with it for a summer or two, but not in the long term."

Realizing the underground supply may be used far faster than it is recharged by runoff, Albuquerque sought voluntary water savings last summer - of only 3 percent to 5 percent, a far cry from Denver's goal of cutting use from a normal year by 30 percent.

Around the Four Corners, these cities and recreation areas hope for snow with varying degrees of fervency:

Phoenix: Open taps in the desert

Phoenix has some of the lowest water rates in the West, and the only mandatory cut in effect right now is a 5 percent slice from government use.

"A lot of people automatically and incorrectly associate the desert with no water," Kroski said.

But the free-flow philosophy permeating Arizona does frustrate some water officials, including Phoenix's conservation coordinator, Tom Babcock.

"There really hasn't been a debate on more restrictions," he said. "It's ludicrous when you consider we're in the Sonoran Desert."

Phoenix did try a stair-stepped system for water rates, raising the fee per 1,000 gallons every time homeowners reached certain benchmarks. (Denver operates under that system, with drought surcharges added on top.) It didn't work for Phoenix, Babcock said, putting a disproportionate burden of the rates on lower-income residents with large families "and the crummiest plumbing."

The city is now back to a seasonal rate, charging more in summer for water than the winter base rate.

Even without water dribbling down from Arizona sources, Phoenix claims it has plenty of supply in the next few years because it draws a major allocation from Colorado River dams under federal interstate compacts. Siphoned off from Lake Havasu at the Central Arizona aqueduct project, most of the water for Phoenix this year will be Colorado snowmelt.

Salt Lake City: Bracing for the worst

Salt Lake City ends up with some water from the Colorado River basin, pumped across the Wasatch mountain range, but relies most heavily on snowfall in its famous ski areas to melt and flow down Deer Creek. Until late last year, Salt Lake had avoided the more severe droughts seen in neighboring states.

Now the city is preparing for the worst, water spokeswoman Stephanie Doerr said. Last year, it made up for shortfalls in its own basin through water purchases from the Central Utah Project, which brings Colorado River basin water under the Wasatch mountains. "That water just isn't available this year, because no one else has water, either," Doerr said.

Preparing for a hot summer, Salt Lake expanded the months for its higher summer water rates, recognizing what Denver saw last year in people watering heavily from May through October. The city also wants a stepped rate structure this summer, charging more for higher use, and will also start water meters "from the first gallon" rather than allowing a free minimum on each bill.

"We're nowhere near cracking this drought," Doerr said. "There is no winter. It's just not happening."

Lake Powell: Scrambling to stay afloat

Lake Powell has fallen to levels the massive Utah and Arizona reservoir hasn't seen since it was still filling up in May 1973. Last year, for the first time, Lake Powell did not rise at all in the spring: Because the reservoir had to keep releasing water downstream to satisfy calls in California and Arizona, snowmelt running in added nothing to the pool. The same is likely to happen this spring, meaning the recreation pool starts low and will get lower.

Lake Powell is shutting some boat launch ramps and extending others with gravel, while considering what to do with entire marinas left too high and dry. At the southern end, the Castle Rock cut allowing boaters from the Wahweap marina to save 7 miles of travel now juts up above water, and the Park Service is debating whether earthmovers or explosives should be used to reopen the channel.

Environmentalists heckle the idea of going hard-rock mining to find more water, calling it typical of the way governments have deformed Western waterways in catering to jet skis and lawn sprinklers.

"In the name of emergencies, they'll do that kind of thing and ask questions later," said Lammers of Living Rivers. "Given the climatic conditions, we're going to be looking at a major crisis very soon."

Other cities need to think twice, though, before pointing fingers at Phoenix or Lake Powell management, said Barry Worth of the U.S. Bureau of Reclamation's Glen Canyon Dam office. If it weren't for water-banking systems such as Powell and Mead, upper Colorado River states such as Colorado and Utah would have to let far more river water go by their land this summer to satisfy compacts guaranteeing flows to California, Arizona and Mexico.

"Sometimes people will say, why does somebody in Colorado or Wyoming care about Lake Powell, because it's long gone from our state," Worth said. "It just happens to be where their insurance account resides."

Santa Fe: Cracking down on users

Santa Fe got serious about drought response before many Southwestern cities knew they had a problem, implementing its current severe stage of curbs on April 10.

Restrictions there include no new plantings of perennials and flowers, delaying hotel sheet changes, no washing of cars at home and only once a month at a commercial wash, one-day-a-week lawn watering and heavy surcharges. While Denver charges \$1.90 on each 1,000 gallons of water over 20,000, Santa Fe charges \$25.

Also in Santa Fe, water caught fleeing the scene of a crime - a leaky or misdirected lawn sprinkler - is officially dubbed "fugitive water" and can cost the homeowner a hefty ticket.

City reservoirs are 29 percent full, compared with 65 percent in the comparable season of an average year, spokesman Juan Rios said.

A major portion of Santa Fe water comes from wells mining the aquifers connected to the Rio Grande, but depleting those is a major concern, Rios said. Two more months of drought will force the City Council to consider a complete watering ban or even a building moratorium, he said.

"We started out the winter very well. But it seems El Nino dried us up and left us hanging," Rios said.

Albuquerque: Switching philosophies

Albuquerque is overhauling both its physical and cultural approaches to water.

Over the next three years, the city will switch from well water to surface water, captured in reservoirs near the New Mexico-Colorado border and brought down the Chama-Rio Grande river systems. That means Albuquerque residents will be praying just as hard for Colorado snowfall as the residents of Denver do, Mayor Chavez said.

Environmental groups, however, question the new draws from the Rio Grande because they may further endanger the silvery minnow and other river life.

The cultural overhaul will take longer, Chavez added. "For years our building codes required X minimum amount of grass. We've changed that, but the cultural shift has been a little slow. It's hard to tell businesses to plant grass, then two years later say, take out your grass. Getting there takes time," Chavez said.

Las Vegas: Light on the restrictions

Las Vegas doesn't fall under the Four Corners moniker, but draws 88 percent of its water from the all-important Colorado River system through Lake Mead.

But one river doesn't make one uniform policy - under current drought restrictions, Las Vegas homeowners can water lawns every other day this coming summer, even though natural rainfall at 4 inches a year is less than one-third of Denver's.

The Las Vegas conservation program focuses on stopping water waste although a citizens advisory committee is considering small drought surcharges for this summer's water rates, said spokeswoman Tracy Bower.

Denver Post staff writer Michael Booth can be reached at mbooth@denverpost.com or 303-820-1686.

Hear the Echo...

50th Anniversary Yampa & Green River Trip, June 2-6, 2003

In June, 1953 Living Rivers' co-founder, the late David R. Brower, launched the modern-day river advocacy movement with a trip down the Yampa and Green Rivers in Dinosaur

National Monument. His objective, which was achieved, was to raise awareness to defeat the proposed Echo Park Dam and to save the Monument from inundation.

Join Living Rivers and the Colorado Riverkeeper, in association with Holiday River Expeditions and other leading Colorado watershed advocates, as we relive this historic trip and launch a new initiative to save Dinosaur from the much slower death caused by Flaming Gorge Dam upstream. The trip is limited to 25 people, so act quickly. The cost is \$1,000.

Participants in this river trip will include activists and naturalists who will openly share their river knowledge with you and your friends. We will discuss the river campaigns of the past and the present, and keep our river ecosystems healthy and our national parks protected. These respected members of the river community include:

Dr. Roderick Nash, who wrote the conservation classic *"Wilderness and the American Mind,"* will row his beautiful wood dory through the towering sandstone cliffs of the Yampa River. The most remarkable cliff face is called Tiger Wall, where tapestries of desert varnish color the surface like the fur of a Bengal tiger.

Jeff Ingram was hired by David Brower when he was the executive director of the Sierra Club, and specifically to help him with the campaign to keep dams out of the Grand Canyon. Mr. Ingram is currently writing a book about this successful campaign and will share this knowledge around the evening campfires after a satisfying dinner.

Dee and Sue Holladay founded Holiday River Expeditions in 1965 and have completed hundreds of river trips in Dinosaur NM. They will share their intimate knowledge of the human and natural history of Dinosaur National Monument as we hike to places of interest.

Kim Crumbo is a famous Colorado River boatman and professional river guide. He is also a passionate advocate of wilderness protection for the river corridors of the Colorado River basin. He is also a respected historian and naturalist, and the author of an excellent river guide that focuses on the human history of the Grand Canyon.

John Weisheit is the trip leader of this expedition and another long-time river guide of the Colorado, and a strong advocate for a free-flowing Green River. He has co-authored

a book about the Colorado River in Canyonlands National Park, which will be issued soon by the University of California at Berkeley. The Waterkeeper Alliance recently designated John as the Colorado Riverkeeper for his dedication to protect this endangered watershed.

For more information contact [John Weisheit](#) at (435)259-1063.

The History of the Echo Park Dam Controversy and the Birth of the River Protection Movement

The Bureau of Reclamation (the Bureau) became a very bold bureaucracy after the completion of Hoover Dam on the lower Colorado River. With the construction of that high dam, the Bureau was transformed into a government-owned business that provided electricity for the consumer market, which was a deviance from its original mission to provide irrigation water for farmers. This set a precedent for the United States government, because it could now compete with private industries and with its infrastructure subsidized by the US taxpayer.

In later years that boldness took another step, just like an expanding corporation, in the form of a search for new dam sites and with the assistance of western, pork barrel politicians. The Bureau tested the waters, so to speak, by proposing that a dam be

built in Glacier National Park, which, as all national parks are, protected by the Organic Act of 1916. That cornerstone Act mandates that park values be forever left "unimpaired by man." That plan rightfully met stiff opposition and the Bureau immediately acquiesced, but did not relent. They decided to try their luck with Dinosaur National Monument, which is protected under the Antiquities Act of 1906.

A certain professor at Harvard University, who had received the Pulitzer Prize for a history novel, steamed under his collar when he heard about the Bureau's continued aggression on our national treasures. His name was Bernard DeVoto, born and bred in Ogden, Utah, and he wrote a scathing article in 1950 for the *Saturday Evening Post* and sparked a movement to save river ecosystems that continues to this day.

In 1952 the Sierra Club hired its first executive director, David Brower, from Berkeley, California. Brower went to work immediately to further build the grassroots campaign that DeVoto started. He formed a coalition of conservation groups that included the Wilderness Society and the Issac Walton League. He involved another professor and Pulitzer Prize winning author from Stanford University, Wallace Stegner, to edit a book called *This is Dinosaur*, that would eventually end up in the hands of every member in Congress. Brower also organized week-long river trips to show Sierra Club members and supporters what was to be destroyed should the Bureau's dam be built. The campaign was successful by using all these organizing components and, by 1956, a vexed Congress killed the authorization to build Echo Park Dam.

Undaunted, the Bureau continued in their relentless campaign to build dams and power plants at the sacrifice of river ecosystems and taxpayers. In 1959 Floyd Dominy, from Wyoming, was appointed as the Bureau's commissioner and would match the organizing skills of David Brower, but in a contrary, top-down fashion. Audaciously, he envisioned building dams in the Grand Canyon, the most sublime canyon on the planet. Since dams could not be built in lands protected by the National Park Service, Floyd would build them above and below these protected lands. At that time Grand Canyon was a smaller national park, centered at Grand Canyon Village near the south rim.

Brower didn't waste any time and countered Dominy at every turn to successfully stop these two dams from being built and by using the same grassroots organizing skills as before. But a new twist was added to the campaign, which included a full-page ad in the *New York Times* and the *San Francisco Chronicle*. The ad's headline said, "Should we also flood the Sistine Chapel so tourists can get closer to the ceiling?" In 1975, Grand Canyon Park was enlarged and brought under the protection of the Organic Act.

Unfortunately, Brower was not successful in stopping the construction of Glen Canyon Dam. Before he died, in November of 2000, he launched yet another grassroots campaign to decommission this dam before its scheduled 100-year life span is completed; when sediment reaches the intakes of the emergency bypass tubes. On March 14, 2000, on the third "International Day of Action Against Dams, and for Rivers, Water and Life" held at Glen Canyon Dam, Brower, participants and 60 other environmental groups signed the "Glen Canyon Declaration." This document promises to restore the Colorado River in Glen and Grand Canyons to their full natural heritage by means of a grassroots campaign, that includes doing river trips.

Please consider your attendance on our Yampa River expedition, June 2 – 6, 2003, to commemorate a fantastic and exciting future for river restoration.

John Weisheit
Colorado Riverkeeper

Living Rivers Director Runs for Sierra Club Board

Living Rivers and the Sierra Club have long shared some common goals, primary among them the restoration of Glen Canyon and the preservation of the currently threatened Grand Canyon ecosystems. So when the Sierra Club's nominating committee asked our own Lisa Force to run for a seat on the Club's national board of directors, it seemed a natural fit.

Ms. Force accepted the honor and is on the ballot for the 2003 Sierra Club Board of Directors. She is running with four other candidates on a slate which promotes an aggressive conservation agenda. The five candidates on Ms. Force's slate will be running against eleven other candidates for the five open board seats.

The other candidates on the slate are: Connie Hanson Gordon LaBedz Nancy Rauch Don Young

Please watch for your ballot statement from the Sierra Club, via mail or email, in the first week of March, and vote to save the planet!

Ms. Force's ballot statement is below. To access the statements of the other four candidates, please see www.johnmuirlives.org.

Sierra Club Ballot Statement:

LISA B. FORCE

Residence: Scottsdale, Arizona

Occupation: Program Director, Living Rivers

Contact: 480-990-7839; LForce@LivingRivers.org

Current Member since: 1998

Background:

Originally from Colorado, I've lived in Arizona for 15 years where I've worked for two leading environmental organizations, fighting for protection of endangered species and restoration of the Grand Canyon, Glen Canyon and the Southwest's wild rivers.

- Previously, owned a successful management consulting business for 8 years
- Longtime Sierra Club activist on sprawl, wilderness, energy and water issues
- Led grassroots activists in anti-logging campaigns
- Defeated state anti-wildlife referendums
- Successfully negotiated with government agencies for river and wildlands restoration
- Launched a Western Grazing Reform program
- Featured in National Geographic and BBC documentaries highlighting US/Mexico environmental issues

- Education: MBA; Bachelor of Science.

Endorsements include current Board members Marcia Hanscom, and Ed Dobson – who says: "Lisa Force is the fastest rising star in the Sierra Club's firmament. She has the skills, passion, and tact to excel at the most demanding of Club positions. We are blessed that she is ready and willing to serve."

Statement: My success in grassroots activism, plus strong business experience, will be assets to the Board. I need and appreciate your vote! Key committees in the new Congress are now chaired by stalwart allies of polluting industries, taking deadly aim at our forests, the Arctic, Yellowstone and more of our last wild places. We must unite now to stop Bush's attack on the environment. We must recruit more Sierra Club members, strengthen our legal tactics and promote aggressive on-the-ground activism. I'll champion Club efforts to defend hard-earned achievements, while creating and taking advantage of new advocacy opportunities at Chapter and National levels.

I'll help the Club achieve a groundswell of action to awaken and motivate the American people to:

- Aggressively protect our parks and wilderness areas;
- Uphold and strengthen environmental legislation;
- Protect public lands from development;
- Promote sustainable agriculture; and
- Create livable, sprawl-free communities.

I'll use my environmental advocacy skills, extensive fundraising background and experience as a successful businesswoman to promote a national agenda that will make the Sierra Club an even more powerful force by:

- Making sure Chapters and Groups get the resources they need. We must use every dollar more efficiently.
- Mobilizing all environmentally concerned citizens to support Club efforts, through expanded grassroots activism and media campaigns.
- Maintaining our strong Outings Program.
- Listening and responding to our members.

I want to hear from you how I can help make the Club work for you. Please contact me!

The Lake Effect

by Christopher Smart

The Salt Lake Tribune

BULLFROG -- Tourism promoters as well as environmentalists who despise Utah's largest reservoir agree on one thing: This is the year to visit Lake Powell.

Thanks to record-low lake levels, new beaches and eye-popping sandstone formations hidden underwater for years have surfaced.

The Lake Powell recreational experience, tourism promoters boast, is as breathtaking as ever. And this year promises to be the best bass-fishing year since 1996 along the reservoir's 2,000 miles of shoreline, say state fisheries biologists.

Meanwhile, environmentalists who favor decommissioning Glen Canyon Dam and draining the Colorado River water it impounds say chances to visit Powell are dwindling. If the drought continues for four more years, they contend, there will not be a Lake Powell. So those wishing to visit the lake should not wait any longer.

Boat ramps at Bullfrog in Utah and at Wahweap in Arizona have been lengthened to reach the receding waters. Now at a record low of 3,612 feet above sea level (equivalent to the low mark set 10 years ago), Lake Powell still provides excellent boating and fishing and superlatives still cannot describe its natural wonders.

However, the lake does not snake up its many narrow canyons as far as it did last summer, according to Morris Christensen, Bullfrog boat-rental manager. In the past, boaters navigating Forgotten Canyon could dock just below the Anasazi ruin known as Defiance House. This year visitors must hike a half-mile up the canyon to reach the ruin.

"It's so weird to come to a place where you were swimming last summer and now there's no water," Christensen says.

In the creek bed below Defiance House, green grass stands in bright contrast to the red rock walls and the 86-foot-high whitish bathtub ring that defines the drought and the diminished waters.

At Hite, where the Colorado River enters the reservoir, acres of mucky silt have sprouted weeds. The boat ramp has been moved several times, but the National Park Service and Lake Powell marina operator ARAMARK are just about out of moves until the water rises. In addition, pumps that supply the Hite community with culinary water from the lake must be moved before the silt clogs them. Boat ramps at Stateline and Antelope Point are closed.

But Dan Resmondo, the director of operations for ARAMARK's North Lake Powell marinas, says it is business as usual. "It's normal operation for us to follow the lake up and down," he says. "We're seeing the same levels we saw in February 1993."

"From a recreation standpoint, it gives a different perspective," Resmondo says. "The canyons look different. If you haven't been here for a while, it will look quite different and provide a new experience." Certainly Bullfrog does not look like it did four years ago, when the lake was at a record high of 3,698 feet. What once was a narrow waterway between Bullfrog and Halls Creek now appears as a hill. Four years ago, the dock was not far from the marina store. Now, it's a quarter-mile away and looks to be sitting in an empty redrock basin surrounded by dusty buoys.

The Lake Is Open: The National Park Service will spend about \$2 million refurbishing and lengthening boat ramps at Bullfrog, Wahweap and Halls Crossing, says spokeswoman Char Obergh.

"We want people to know the lake is open," she says. "There may be some delays in launching, but we're doing everything we can to make it a good experience."

Lake Powell consistently ranks as the second- or third-most-popular Utah tourist attraction. Last year visitation dipped to 2.1 million from 2.3 million in 2001, says Jon Kemp, Utah Travel Council research analyst. He blamed the downturn on the aftermath of 9-11, as well as a perception that the lower water level hinders boating and the scenic experience.

However, the 200,000-visitor drop did little damage to the state's \$4 billion tourist economy, Kemp explained. "It's almost impossible to quantify any economic impact" from the 9 percent drop in Powell visitors.

All that could change, argues John Weisheit of Living Rivers, an environmental organization that favors draining Lake Powell. If the severe drought persists for four more years, he notes, the reservoir will effectively be drained -- dam or no dam.

"It's going to continue to drop. And it's going to drop dramatically. The boat ramps are going to run out of topography," he says.

That may sound like a wild claim, but it is not out of the question, concedes Andrew Gilmore, hydraulic engineer for the U.S. Bureau of Reclamation. "It's conceivable that we could run out of water at Lake Powell. If we had another four years [of drought], we'd be awfully close," he says.

According to bureau calculations, the lake level will fall until the spring snow runoff, when the water will begin to rise, Gilmore says. "Our current inflow forecast has Lake Powell dropping another seven feet until April, when it will begin to fill up."

But unlike 10 years ago -- when the lake level jumped by 60 feet during a spring with substantial snowpack across the Colorado River drainage system -- this year's melt will be modest. "The snowpack is fairly meager across the whole basin," Gilmore says. "Our forecast is for 58 percent [of normal] runoff."

Periods of low precipitation are the reason Glen Canyon Dam was built, Gilmore says. "We look at it like it's performing its job. In a drought, Lake Powell is doing its job," he says of its water-storage capabilities.

At 53 percent full, Lake Powell now holds about 13 million acre-feet of water, Gilmore says. The forecast calls for the reservoir to gain about 4 million acre-feet in runoff. But under the Colorado River Compact signed by the seven states in the Colorado River drainage, Lake Powell must deliver annually 8.23 million acre-feet of water downstream, where it is impounded at Lake Mead.

"In these drought years, more goes out than comes in," Gilmore says.

No one is sure whether the drought will continue. But a study in the Feb. 11 edition of Geophysical Research Letters tracking ocean temperatures and tree rings anticipates the drought will linger, according to one of its authors, Julio Betancourt.

A research scientist for the U.S. Geological Survey and an adjunct professor at the University of Arizona, Betancourt explains that the last time the South Pacific was as cold as it is now and the North Atlantic was as warm, the Colorado River drainage experienced the drought of the 1950s, which lasted 25 to 30 years in some places. "We are now in a megadrought," Betancourt says, "in that it stretches from Montana to New Mexico and involves several seasons."

Good for the Fish: Analysis of tree rings during a 750-year period in the region revealed that dry and wet patterns do not occur at regular intervals. "You can't predict drought by time. The tree rings show that droughts don't occur cyclically," he says.

Whether Lake Powell eventually turns into a mud puddle remains the stuff of conjecture. But in the short term, the drought is good for the warm-water fishery, according to Wayne Gustaveson, a biologist with the state Division of Wildlife Resources.

"We need these low periods to re-establish habitat and nutrients,"

LR Press Release 03/03/03

Living Rivers to Target Mill Creek Revival on March 14

We've seen it every summer: a dried-up creek along our beautiful Mill Creek Parkway, the most blatant example of the growing ecological crisis occurring along this much appreciated drainage. Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted. As drought and water demands persist, it's unlikely this situation is going to change without community support to bring our beloved Mill Creek back to life. Living Rivers will be kicking-off a new campaign to aid in the Creek's defense on Friday, March 14, the Sixth Annual International Day of Action Against Dams, and for Rivers, Water and Life.

The festivities begin with a noon rally and picnic on the lawn at the County Courthouse. Longtime environmental musician Peter Neils will help set a festive mood while a host of concerned citizens present information on how and why we need Mill Creek's flow. A set of recommendations for the County Council consideration will also be presented, along with ways in which the community can become involved in promoting them.

That evening, beginning about 9:00 P.M., Living Rivers will be hosting the "Mill Creek Revival & Colorado River Fiesta" at the MARC (100 North and 100 East). This free party will emphasize a revival spirit with dancing, costumes and games. There is no admission charge and refreshments are free. Also at the MARC that evening, beginning at 7:00 P.M., is a free film "U.S. Foreign Policy: The War Against the Third World" sponsored by Moab Citizen's for Peace and Global Justice.

Mill Creek's ecology is being devastated. Native fish, such as the flannelmouth and bluehead suckers, depend on a flowing Mill Creek. Other critters, like beavers and muskrats, need Mill Creek too. The most critical habitat of Mill Creek is near the mouth, which provides a refuge and food source for the endangered and threatened fish species of the Colorado River.

"What's happening here in Grand County is emblematic of the larger problem affecting the entire Colorado River watershed," says John Weisheit, Living Rivers conservation director. "Despite nature's warnings that we are using far too much water, we continue to focus on getting more and not on conservation."

Last month the Grand County Water Conservancy District asked the Bureau of Land Management for permission to reduce by half the amount of water it leaves in Mill Creek below the diversion for Ken's Lake. This request will likely be denied. But the search for water continues as an expensive proposal to pump Colorado River water into Ken's Lake moves forward.

Evaporation and seepage losses to Ken's Lake alone amount to 30 to 70 percent of the water diverted from Mill Creek. Increasing this storage efficiency could go a long way towards helping to get water back into the creek.

Additionally, many of those irrigating with Mill Creek water are given no incentive to conserve. Their water rights are often based on what is known as a "use it or lose it" principle. If irrigators do not use the amount of water the state of Utah believes is necessary for them to grow their particular crops, they can lose their right to this water. Some farmers have stated that they would be glad to leave some water in the creek, if a system could be put in place to allow this to occur. For example, The Nature Conservancy has received approval to transfer water rights to the Utah Division of Wildlife Resources for increasing stream flow.

Most of the water diverted from Mill Creek is used for alfalfa, which, if not irrigated efficiently, can be a very water intensive crop. However, no help is available for those who are potentially interested in making the transition to more water efficient, higher value crops. For example, alfalfa can require four times as much water as grapes, and provides the farmer with a crop that yields only \$100 per acre-foot of water, whereas good quality grapes can yield \$7,500 per acre-foot. Implemented properly, such programs could not only aid in improving Mill Creek, but also increase the economic output of the community. It has also been documented that home values increase when they are associated with a functioning and attractive riparian ecosystem.

LR Letter 03/07/03

YDP Comments to the Bureau

March 6, 2003

Mr. Robert Johnson Regional Director Lower Colorado River Region U.S. Bureau of Reclamation PO Box 61470 Boulder City, Nevada 89006-1470

By fax: (702) 293-8614

Dear Mr. Johnson:

Thank you for presenting the Bureau's most recent draft of Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act (CRBSCA) (Public Law 93-320) on February 25, 2003. We write in response to that presentation and to reiterate our opposition to the Bureau's plan to request appropriations to upgrade and prepare the Yuma Desalting Plant (Desalter) for operations. We further emphasize our concern with the Bureau's failure to respond to Congress' request in the draft report presented this week.

The current version of the report to Congress includes a number of fallacies, inconsistencies and highly unlikely assumptions that overstate the economic feasibility of operating the Desalter and understate the feasibility of alternative measures for replacing the bypass flow. We again remind the Bureau that this report subjects the Secretary of Interior to a reprimand from Congress, which has legislated that:

The Secretary is authorized to provide for modifications of the projects ... to the extent he determines appropriate for purposes of meeting the international settlement objective of this subchapter at the lowest overall cost to the United States. 43 U.S.C. § 1574 (emphasis added).

Further, the Bureau has failed to produce the information requested by Congress concerning alternatives to operating the Desalter. Congress specifically requested a "report on alternatives to meeting Treaty requirements without the YDP, and actions the Bureau of Reclamation can take to reduce the high annual operation and maintenance costs." S. Rep No. 58, 106th Cong. 1st Sess. 80 (1999) (emphasis added).

We appreciate your correction of the estimated low-end cost of acquiring short-term leases of water, referred to in this draft as forbearance agreements, as well as the inclusion of the cost comparison table. However, to reiterate the other questions raised in our November 22 letter would be to virtually rewrite the entire letter. Therefore we refer you to our previous letter and again request answers to the questions and concerns therein.

In addition to the concerns already expressed, we request corrections to the current report and answers to additional questions as outlined in this letter.

Environmental Review

A complete environmental review of the impacts of re-operation of the Desalter or other alternatives must be completed prior to any implementation of actions to further the recommendations included in the report, including seeking congressional appropriations. We are concerned that the Bureau has already begun to channel funds towards preparation for reoperation without the benefit of environmental review, and without the benefit of analysis of fully developed alternatives.

The Bureau has also not yet secured a discharge permit for product water from the Arizona Department of Environmental Quality. Proceeding with appropriations requests and funding of Desalter readying activities without the appropriate environmental reviews would be pre-decisional.

Furthermore, we wish to point out that the language included in the current report and the cover letter from the Secretary which talks about assuring the operation of the YDP is pre-decisional in that it precludes a No Action alternative . Such language must be eliminated from the report and cover letter before transmittal to Congress.

Discussion of the Cienega de Santa Clara is incomplete, serves only to mask the importance of the wetlands to wildlife and humans, and retreats from the enhanced description in the previous draft. The Cienega de Santa Clara (not once referred to in full) provides habitat not only for migratory waterfowl and shorebirds, but also for threatened and endangered species. What is more, these species -- including the desert pupfish, Yuma clapper rail, and black rail -- have been listed pursuant to the U.S.'s and Mexico's endangered species statutes. Deletion of endangered species sustained by the Cienega does not eliminate the Bureau's obligations to endangered species, and what is more, the Bureau has glossed over a significant piece of information that we are sure Congress would appreciate having when weighing the costs and benefits of operating the Desalter.

Likewise, the reduced volume of water coupled with increased salinity of water reaching the salinity will degrade the ecosystem. This ecosystem is part of a Biosphere Reserve as designated by Mexico, is a major link in the Pacific Flyway and supports the vast majority of the Yuma clapper rail population. To claim that these effects "may" happen (p. 4) is deceptive and underestimates the impact to the environment that will most certainly occur as a result of operating the Desalter. Again, costs in the form of adverse impacts to the environment have been missed.

We also suggest you refrain from qualifying the Cienega as an "isolated" wetland. It is not, and this is a blatant attempt to minimize the size and importance of this wetland complex.

Economic Analysis

There are several fallacies and assumptions included in the economic analysis of operating the Desalter and implementing the alternatives. Many of the assumptions do not withstand the test of simple mathematical principles. Others are so optimistic as to be deceptive. In modeling projections, assumptions are necessary and in providing a cost estimate range, optimistic assumptions can be utilized in predicting the low-end cost. If such assumptions are employed, however, equally pessimistic assumptions must be used in predicting the upper-end of cost ranges. This is not at all the case in the Bureau's analysis.

Without performing a full analysis of our own as yet, we cannot divine every fallacy in the Bureau's analysis. However, some of the more obvious are as follows:

- Including the Desalter ready-reserve maintenance expenditures in the cost of obtaining forbearance agreements is misleading and completely unacceptable. Including it in this analysis is an insult to Congress and to the public. Desalter maintenance and pursuit of forbearance agreements are completely unrelated processes; either can quite obviously exist without the other. Linking them for the purposes of economic analysis in this report falsely inflates the costs of alternatives to operating the Desalter.

- Including \$2.4 million in research in the \$5.1 million annual cost of keeping the Desalter in ready-reserve mode is erroneous. The Desalter could be kept in ready-reserve without doing extraneous research. This is at best poor math and at worst a blatant effort to delude Congress. It needs to be backed out of the equation.

- While the analysis includes extraneous unrelated costs to estimate forbearance costs, it fails to include estimates of environmental mitigation costs for Desalter operations. The Bureau fails to note that operation of the Desalter would degrade the Cienega de Santa Clara but references studies with these conclusions (p.16); it is therefore appropriate to include the potential costs of avoiding, minimizing, and mitigating such impacts within the total projected cost of Desalter operation.

- Even using the Bureau's unrealistic assumptions, the analysis does not provide the accurate cost of operating the Desalter in its five-year and ten-year scenarios. By the Bureau's estimates, the Desalter would have to operate at one-third to two-third capacity for four years. Yet the analysis calculates cost of product water using the admittedly impossible assumption of full capacity. Operations at one-third and two-thirds capacity produce water not at the stated cost of \$305/acre foot, but at an estimated cost of \$689/acre foot and \$325/acre foot respectively. The Bureau should revise the report to accurately reflect the increased costs associated with necessary maintenance and system downtime. Assuming two years of operations at one-third capacity and two years at two-thirds capacity, as suggested in the Bureau's Gantt Chart (per HJA Consulting) product water in the five-year scenario averages \$466/acre foot.

- The low-end estimate of \$32/MWh for power costs to operate the plant is unrealistic. The best price available for a strip of power (four quarters averaged) on the bulk power market today on the southwest grid is approximately \$44/MWh, even assuming the plant will be operating during less expensive shoulder hours. While the bulk power market is arguably volatile, this is not a liquid market. The Forward Curve for the market does not predict excesses of supply over demand, and with build-out time for power plants of five to ten years, the Curve tends to be accurate. The low-end estimate used in this analysis is unlikely to be available for a long-term contract in the massive quantity needed for full capacity Desalter operations.

- The report fails to analyze a one-time cost of decommissioning the Desalter as an action the Bureau of Reclamation can take to reduce the high annual operation and maintenance costs of the Desalter. This alternative should be compared against keeping the Desalter in ready-reserve mode and/or operation of the Desalter at various partial or full capacity levels.

Operations Decision Criteria

The Bureau stated in its presentation that decisions on the percentage of capacity at which the Desalter would be operated would be made annually. Yet the Bureau was unable to adequately answer our question concerning what the decision criteria will be. Please answer the following questions regarding operating capacity and decision criteria: · What are all the elements of the decision criteria? · What will be the timing of determining percentage of capacity for operations? · Who beside the Bureau will participate in developing and applying the criteria? · Will the development of these criteria be subject to public review? We have similar concerns and questions regarding the replacement criteria (p.20).

Scientific Debate The report states that "Operation of the YDP would decrease the volume and increase the salinity of bypass water reaching the Cienega and may degrade its ecological value. Operation of YDP would be met with substantial controversy, and additional scientific debate." (page 5) The phrase "additional scientific debate" has not appeared in previous drafts: why was it included in this draft? The disruption of bypass flows to the Cienega in 1993, due to flood damage and subsequent repairs of the bypass canal, significantly degraded the Cienega. These impacts are clearly documented in the scientific literature. If, as we suspect, the Bureau is unable to document any "debate" about the expected degradation of the Cienega due to Desalter operation, then all references to "scientific debate" should be expunged from the report.

Federal Obligation Previously, we disputed the Bureau's apparent claim that the "interim period," in which the United States received credit for the Coachella Canal Lining Program, had ended. Given the Secretary's decision to reduce California water orders to 4.4 million acre-feet for calendar year 2003, we believe that this "interim period" has ended. Given that the Secretary authorized the delivery of some 200,000 acre-feet of additional Colorado River water to California's agricultural contractors last November – despite the existence of extraordinary drought throughout the basin – it is quite clear that the interim period was in effect through 2002. Further given that the Coachella Canal Lining Program salvages some 132,000 acre-feet per year, 24,000 acre-feet per year more than flows to Mexico via the Bypass Drain, and that there has not been a flood release from Hoover Dam since 1999, it is reasonable to assume that the United States has accumulated 72,000 acre-feet of bypass-flow credits, that can be applied to the current year's obligation. This federal credit should be noted in the report.

Water Supplies and Needs While we understand the concerns surrounding tightening water supplies, particularly those of Arizona contract holders, we do not trust in the rationale that operation of the Desalter seeks to address those concerns (p.14). Were the Bureau truly interested in alleviating the pressures on Lake Mead storage and lower priority water users, this interest would be reflected in other Bureau proposals and policies – unfortunately, it is not. For example, in the FEIS for the Inadvertent Overrun and Payback Policy, the Bureau would allow any and all debt to be forgiven in the event of a flood control release. If the Bureau were aiming to maximize water storage, the agency would require full payback of all debt.

Thank you for the opportunity to comment. We hope these concerns will be accommodated in a new draft report. However, should you continue to include the elements that we find objectionable, we insist that you adjust the language of the report under "Consultation with Affected and Interested Parties" to remove any implication that we concur with the report as written. This could be effected by changing the last sentence at the end of that section to read, "This report of the Secretary of the Interior reflects the views and proposals of the Department after consideration of the comments and suggestions received in that review process. It does not reflect a consensus of the parties with which the Bureau of Reclamation consulted, nor does it represent a compromise between the different views expressed." Should this report go forward with elements that we find objectionable and an implication that we concur with those elements, we certainly would not hesitate to contact members of Congress on our own to expose the deception being waged by the Department.

Please don't hesitate to contact us if you have questions. Thank you.

Writers on the Range: Lake Powell--Going, going, gone?

by John Weisheit

Who would have believed it? Water levels at Lake Powell have dropped to 50 percent for the first time since it filled in 1980. This draining is likely to continue to the point where the reservoir could vanish in the next three-to-four years.

With snowpacks below 25 percent of normal, and continued warnings from the U.S. Geological Survey, EPA and others that a severe and sustained drought should be anticipated, Lake Powell's days may be numbered. A 1995 study published by the American Water Resources Association predicted that a severe drought would lead to Lake Powell's draining within eight years. Things are right on schedule.

Now that Lake Powell is down by some 87 feet, three boat ramps have been closed: Antelope Point, Stateline and Hite. The National Park Service is working with a \$3 million emergency appropriation to extend other ramps as the reservoir continues to decline. But construction of the recently approved \$70 million Antelope Point marina complex is in limbo, because boats can't be launched from what has been revealed by drought to be a cliff.

Once Lake Powell drops an additional 28 percent, it will no longer generate hydroelectricity because Glen Canyon Dam's penstocks will be exposed, and water will no longer be able to turn the generators. There's also a problem with sediment, since fluctuating river flows that occur during low reservoir levels will speed the movement of sediment toward Glen Canyon Dam.

The U.S. Geological Survey says that major droughts of the past, such as the years from 1942 to 1977, went largely unnoticed. We notice this drought because the West has four times the population and we've been mining our groundwater.

Federal scientists have also informed us that the previous century was 20 percent wetter than normal. That means our ability to put water to work was helped by luck as much as it was by massive engineering projects. Even at those inflated levels, Colorado River water allocations are 20 percent above what the river delivered.

We've managed to avoid crises in the past because not all the Colorado River Basin states used their full allocations. Even so, the river reached the sea only twice in the past two decades. Add to all this a drought cycle that is predicted to last 25 years, and Lake Powell, along with every other reservoir in the upper Colorado River storage system, won't have water to store.

Vanishing bodies of water in the Western United States shouldn't surprise us: It's part of our legacy. In 1890, the Geological Survey's first professional paper discussed the principles of global climate change. The publication analyzed how a body of water that was once 800 feet deep -- Lake Bonneville -- had reduced itself into the briny and shallow Great Salt Lake.

In the 19th century, the physical geography of the planet provided undeniable evidence that humans can become victims of climate change. In the 20th century, we gained new tools, such as tree-ring data, that allowed us to reconstruct the climate of the last 400 years. This reaffirmed that the Earth's climate varies dramatically. Whether these changes result from the effects of greenhouse gases or from natural cycles, the results are the same.

Scientists have given us ample warning, but our water-management experts don't listen. At a recent gathering in Moab, Utah, John Keys, Commissioner of the Bureau of Reclamation, worked to calm the fears of those concerned that the Colorado River may soon be unable to provide for the 25 million people plumbed into his system.

"They (the reservoirs) are doing exactly what they were designed to do," he said. But when it was pointed out that these reservoirs are declining over 10 percent per year, and thus could empty in another five to six years, he had no plan for how the federal government would handle the shortages.

Certainly many of us will be pleased to see the uncovering of Glen Canyon. It will be nature's way of reminding us that we are not in control.

It would be truly unfortunate, however, if the warnings these declining levels represent are not heeded, and all those presently reliant on the overuse of Colorado River water get plunged into a crisis with no plan of action.

John Weisheit is a contributor to Writers on the Range, a service of High Country News in Paonia, Colorado (hcn.org). He is conservation director of the nonprofit group, Living Rivers, in Moab, Utah.

Take Action 03/07/03

Cienega de Santa Clara Needs Your Support!

Please read and respond to our summary of the Bureau of Reclamation's Draft 28 Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act. If the proposal put forth in the BuRec document were to be accepted, the already imperiled Cienega de Santa Clara in the Colorado River Delta could be decimated.

Background: Under the Colorado River Basin Salinity Control Act of 1974 (PL 93-320) (CRBSCA), the United States has had to bypass the highly saline agricultural drainage from the Wellton-Mohawk district through the MODE canal, in order to meet the salinity requirements of the Act. The discharge inadvertently revived the Cienega de Santa Clara, a rich 14,000-acre wetlands, home to several endangered species and an important stop for migrating birds on the Pacific flyway. The Cienega and 90% of the delta region in which it exists was destroyed when water diversions from the Colorado River by the United States and Mexico left nothing but unscheduled reservoir "spills" to water the formerly two million acre biologically diverse region.

The CRBSCA authorized building the Yuma Desalting Plant (YDP) to desalinize the agricultural drainage. But the plant was never operated at more than one-third capacity and for more than a few months because it was not economically viable. Water produced by the YDP would come at an estimated cost of \$400 - \$900 per acre foot. By comparison, farmers in the Yuma area pay an average of \$12 per acre foot.

Summary:

The draft report, Modifications to Projects of Title I of the Colorado River Basin Salinity Control Act, sets out the Bureau of Reclamation's (BuRec) case for operating the YDP , thereby reducing bypass flow to the Cienega de Santa Clara. At full operating capacity, the Cienega would receive only the intensely saline brine from the YDP process, which would completely destroy the wetlands.

The BuRec views the bypass flow to the Cienega as lost water because it does not count as part of the U.S. obligation of water delivery to Mexico. The amount of bypass flow is ~108,000 acre-feet per year and this bypass water has an average salinity on the order of 2800 ppm.. The YDP operations would treat Wellton-Mohawk agricultural drainage water and return it to the Colorado basin where it could be included as part of treaty obligation to Mexico at the Northern International Boundary.

The draft report exists as the basis from which BuRec can make funding requests to support forbearance agreements and request funds to ready YDP to operate at full capacity. The draft report states that the Cienega de Santa Clara has been created, but does not detail the Cienega's history of having been a component of the pre-dam wetland complex along the Colorado delta. As well, it offers no plan for supporting existence of the Cienega. The report states that the bypass drainage to the Cienega has been at the discretion of the U.S.

The next step for the BuRec after submitting this proposal to Congress is to "move forward with the expenditure of funds to implement" their proposed measures. In truth, BuRec has already increased it's funding for the YDP in 2003, and is working to correct six areas of plant deficiencies by the end of the year. Further appropriations appear to have been requested and included in the 2004 appropriations draft.

The proposal finds its justification in this reasoning: "Because the drainage water in the bypass is not desalted and returned to the River, the [current] method of operation results in the release from Lake Mead of comparable quantities of water, which otherwise would not be needed if the bypassed water was delivered to Mexico as part of the U.S. Treaty delivery obligation." The Bureau argues that this aggravated water shortages in the Colorado reservoirs. The report notes that "tightening water supplies and increased demands has raised important concerns" especially from Central Arizonan Water Conservation District, which operates the Central Arizona Project (CAP).

The 108,000 acre-feet bypass flow to Cienega represents less than one percent of the average annual flow of the Colorado River's 12 million to 15 million acre feet. The Cienega is an incredible wetland with a diverse vegetation structure that supports an

equally diverse population of birds and animals including the federally listed endangered Yuma clapper rail and the desert pupfish. The result of operating the YDP would be to cutoff flows to the Cienega so that 108,000 acre feet more of the U.S. excess water reserves could stay in its impoundments, much of it to evaporate.

The draft report explains that a “thorough environmental review of the original EIS (which dates from 1975)” would be undertaken. However, the environmental review with regard to the effects on the Cienega is largely irrelevant since the Cienega is located in Mexico. In response to a lawsuit brought by Environmental Defense against the BuRec concerning Colorado River delta species, the agency claims it is not responsible for the impact its operations have on endangered species that exist across the international border. In addition to an environmental review, the draft report states that under Section 402 of the Clean Water Act, a discharge permit must be obtained to transfer desalted product water to the Colorado River.

The report includes a section on Environmental considerations relative to the bypass flow and discusses the Cienega and its Biosphere Reserve status (p.14). The document states that “reduction of current bypass flows will be met with substantial controversy.” However the document says an environmental review will be conducted but makes no proposal for sustaining the Cienega. The reader is forced to assume that if this proposal is allowed to go forth, the Cienega’s outstanding ecological value will be severely compromised. Biodiversity will receive a crippling blow.

In the report section subtitled "Potential Sources of Replacement Water to meet Title I objectives" (p.17) it is stated that replacement supply for bypass flow to the Cienega must come from inside the Colorado River Basin. “The primary source of replacement water for flows in the Bypass Drain is expected to be from the Lower Basin agricultural water users, and recovery and return of Colorado River water that would otherwise be lost to Mexico as groundwater. About 4.9 million acre-feet per year of Colorado River water is used in the Lower Basin for agricultural purposes...(p.17)” The report states that this fact should yield “opportunity for the program and water agencies to acquire additional water.”

The alternative most fully explored is forbearance, essentially short-term leases of water from area agricultural interests. The cost of forbearance agreements is estimated to be \$60 to \$309 per acre foot. Living Rivers research has shown the least valuable production of crops in the area to be worth \$53 per acre foot of water. The BuRec estimate of \$60 per acre foot is realistic. However, in order to make the YDP operations appear economically feasible compared to the environmentally responsible alternative of leasing water, the agency had to include a highly exaggerated higher cost estimate. In order to reach the \$309 per acre foot estimate, the agency included the cost of keeping the YDP in "ready reserve."

Since 1992, the YDP has been maintained on standby - or ready-reserve - at an annual cost of ~\$5.1 million. This cost includes \$2.4 million of general research concerning desalting plants. Keeping the plant in ready-reserve mode obviously has nothing to do with seeking water leases. Including the cost in alternatives to operating the YDP is a blatant lie.

The report mentions the alternatives of "extraordinary conservation" such as upgraded irrigation systems for farmers in the lower basin. It does not however develop these alternatives nor does it state even an estimated cost for these alternatives.

The draft report explains that the YDP operation would cost \$26-34 million yearly. The other effect the report mentions is that water flowing to the Cienega would be decreased to reject brine. According to report predictions, the flows would be reduced to 30,000 acre feet yearly with an average salinity of ~9000ppm . The annual amount of water the YDP is predicted to process is 60,700 acre-feet to 75,400 acre-feet. Then the BuRec would blend that product water with 10,000 acre-feet per year of untreated agricultural drainage water (p.15) yielding a complete return to the Colorado (when YDP is operating at full capacity) of 70,700 to 85,400 acre-feet.

The BuRec predicts that desalted product water from the YDP at full capacity operation will cost between \$305 and \$480 per acre-foot. The estimates are based on completely unrealistic assumptions including insanely low power costs, and do not take into account that the plant cannot operate at full capacity for at least four years. At one third capacity, even the BuRec's unreasonably optimistic estimates show a cost of \$689 per acre foot of product water.

The report concludes that BuRec intends to follow a two-pronged strategy of pursuing forbearance agreements and readying the YDP for operations.

Living Rivers and a network of other environmental groups in the US and Mexico do not intend to allow a thriving wetland to die. Nor should the phenomenal cost of operating the YDP be imposed upon taxpayers particularly in a time of national economic distress. We will be preparing comments to the BuRec report as well as our own report to Congress about the real economics of operating the YDP versus pursuing lower-cost and environmentally responsible options.

Please send the BuRec a message that their report to Congress is irresponsible and unacceptable in the fallacies it includes as well as in its erroneous conclusion. Send comments by March 31, 2003 to:

Letter to LR 03/14/03

To Gale Norton Demanding Immediate Action on Colorado River Drought

Honorable Gale Norton
Secretary, United States Department of Interior
1849 C Street, NW
Washington DC, 20240
Dear Secretary Norton,

We are writing to seek your cooperation in averting the emerging social, economic and ecological crises related to Colorado River water availability. Although snow packs in the basin are improving, river flows are again predicted to be below normal for the fifth straight year. According to the National Oceanographic and Atmospheric Administration, the current El Niño event has, "reached its mature stage and is expected to weaken." Basin-wide storage is at an all-time low. With federal water allocations continuing to exceed natural deliveries, the region is quickly nearing the halfway point to catastrophe. It is vital that federal, state, Indian tribes and private groups begin developing a framework for revisiting Colorado River water allocations and the laws which govern them.

We fully appreciate the political, economic and legal complexities associated with re-opening discussions pertaining to the Colorado River Compact and the Law of the River. However, the warning signs of system collapse are apparent. Storage in reservoirs is less than 60 percent of capacity and declining at a rate of more than ten percent per year. The Geological Survey cautioned last year that Western water managers should be prepared for below average precipitation over the next several decades. They caution that "a repeat of the 1942 to 1977 drought could be catastrophic" given the Colorado Basin's increased population growth.

If precautionary mechanisms are not put in place shortly, a crisis of unquantifiable proportions could easily unfold. Ten percent of the nation's population relies on Colorado River water, including the metropolitan areas of Los Angeles, Phoenix, Las Vegas, Salt Lake City, Albuquerque, San Diego and Denver. A \$1.5 billion agricultural industry and 4200 megawatts of the Southwest's energy supply could be severely impacted. Yet, Bureau of Reclamation Commissioner John Keys stated on February 13 that his agency has no plan for how to allocate water once major shortages occur.

Such complacency will not only burden the Southwest's economy, but the federal treasury and judiciary as well. Emergency funds will be sought to compensate irrigators who shift their water to municipal users. Major lawsuits will materialize as Western states and water users battle the federal government over control of water rights. Further compromises regarding in-stream flows will burden federal courts with additional environmental complaints. Unless timely, pro-active measures are taken, an extensive amount of federal, state and local resources will unnecessarily be poured into crisis management.

Such an atmosphere will exacerbate tensions amongst competing interests and further complicate efforts to establish realistic long-term Colorado River management strategies. Given the present allocation system, it is not a matter of if, but rather of when, the Colorado River storage system will be unable to meet demand. Scientists have determined that the actual average flow of the Colorado River at Lee's Ferry is 20 percent below the original Compact allocations. The data also reflects that the Colorado River flow during the current drought cycle has been 15 percent lower than during the first four years of the 1942-1977 drought. Additional reservoirs will not solve the problem; new strategies for water allocation and use must be developed as soon as possible. We seek your commitment toward helping to establish a dialogue amongst the basin states, water users and environmental groups in order to begin tackling this critical problem.

The federal government has primacy over Colorado River management; you are the basin's legally designated Water Master. The Colorado River is held in trust for the benefit of the public, and it has become obvious that its management can no longer be relegated solely to the basin states. Uniform leadership, authority and policy development must come from the Department of the Interior. Your action at the end of last year to limit California and Nevada's deliveries to their prescribed allocations was a positive first step. We now encourage you to begin a thorough overhaul of the Colorado River Compact--one that realistically reflects present use patterns and anticipated river flows. At a minimum, water allocations need to be reduced to reflect actual historical river flows.

Bringing the basin's water use into balance with natural flows will be much easier, far more efficient and certainly less costly than the monumental engineering works of the past have been. In fact, as was calculated by the late Walter B. Langbein, the Colorado River Basin's reservoirs' evaporation and seepage losses far exceed the benefits of the additional water storage they provide.

In order for the Department of the Interior to realize a reduction in water allocation, a top priority should be the establishment of water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80 percent of Colorado River water not destined for Mexico; programs should be established to aid irrigators in replacing water-intensive feed crops, such as alfalfa, with produce crops that use significantly less water per acre. Such measures could reduce irrigation consumption in the Colorado River Basin by half, thereby freeing up more

water than is presently being used by all the municipalities currently plumbed into the Colorado River system.

The historical theory underlying Colorado River law and management is that in years of below-average river flow the sixty million acre-feet of storage built into the system will act as an insurance policy against the effects of cyclical drought. But we are becoming increasingly aware that such insurance is not limitless. Increasing water use within the basin and changing climatic conditions are driving the system to the breaking point. This need not occur. A vast amount of additional water management understanding and experience has been accumulated since the Colorado River Compact was first crafted. The Colorado River can accommodate the future needs of the Basin states, Indian tribes and Mexico as well as the natural environment. This important goal will most effectively be accomplished when the Department of the Interior takes the lead in the evolution of management policies which recognize the Colorado River's inevitable constraints.

Thank you for your attention to the matter, and we look forward to your reply (transcribed below).

Sincerely,

Owen T. Lammers
Executive Director

cc: John Keys, Commissioner, Bureau of Reclamation

Commissioner Keys responds to LR letter United States Department of the Interior

Bureau of Reclamation
Washington, D. C. 20240
In Reply Refer To:
W-6333 June 17, 2003
ADM-13.00

Mr. Owen T. Lammers
Executive Director, Living Waters [Rivers]
P.O. Box 466
Moab, Utah 84532

Dear Mr. Lammers:

Thank you for your letter to Secretary of the Interior Gale A. Norton dated March 14, 2003, regarding Colorado River issues. The Secretary has asked that I respond to you on her behalf. Similar to other Western rivers, the Colorado River Basin has experienced four dry years, some of which having been among the driest on record. With such a significant part of the nation dependent on water supplies from the Colorado River, it is truly fortunate that we continue to enjoy the benefits of our existing

water supply facilities that help to mitigate to make up for these tough years of insufficient moisture.

As you point out in your letter, these issues are complex and sometimes contentious, and it gives me a perfect opportunity to mention the Secretary's new initiative, entitled Water 2025: Preventing Crises and Conflict in the West. Water 2025 recognizes the realities we face in dealing with water issues, such as explosive population growth, increasing needs for water for environmental and recreational uses, and the national importance of food and fiber production from Western irrigated agriculture. Water 2025 sets forth a strategic plan to facilitate a vigorous and educated public discussion in key Western communities, including those that rely on the Colorado River, where the likelihood for conflict and crises over water exists or can be predicted to occur by the year 2025. I invite you to attend and participate in any of the eight regional consulting sessions hosted by the Bureau of Reclamation. The information on these sessions is located on our website, www.doi.gov/water2025.

Again, thank you for your comments and concerns about Colorado River issues. The Colorado River has been and will continue to be a top priority for our agency, and I look forward to working with you and your organization in the constructive and positive manner set forth in Water 2025.

Sincerely,

John W. Keys, III
Commissioner

El Niño provides no Drought Relief Colorado River Storage at lowest levels in history

"Drought Watch" Campaign demands Federal Action to Avoid Catastrophe

The National Oceanographic and Atmospheric Administration reported on March 3, 2003 that the current El Niño event has, "reached its mature stage and is expected to weaken." What was hoped to provide a break from several years of below average precipitation, has only brought snow packs to 80 percent of normal. The result: water

use in the Colorado watershed will again outpace river deliveries, causing reservoir levels to decline for the fifth year in row.

As of today, levels in the Colorado watershed's primary reservoirs are at an all time low of 59 percent, declining at a rate of ten percent per year. Abundant historical evidence reveals that the present drought is far from unprecedented, and warnings from the United States Geological Survey one year ago urged water managers to be prepared for several decades of below average precipitation. They cautioned that "a repeat of the 1942 to 1977 drought could be catastrophic," given the Colorado Basin's increased population growth and water use. River flow during the current drought cycle has been 15 percent lower than those at the beginning of the 1942-1977 drought.

However, on February 14 Commissioner John Keys of the Bureau of Reclamation stated that his agency had "no plan" for how the federal government would handle water shortage once reservoirs began running dry. The Bureau of Reclamation has merely continuously revised its over-optimistic hydrologic forecasts for river flows. The most recent, on March 3, was a 25 percent downward revision for flows into Lake Powell, the principle figure for determining water availability for California, Arizona and Nevada. In October, 2002 BuRec predicted flows would be 10.14 million acre-feet in the water year of 2003. Now they are predicting only 7.44 million acre-feet, 62 percent of normal.

"This is nothing more than the beginning of an Enron event for the 25 million people reliant on the Colorado River water," said Owen Lammers, executive director of Living Rivers, the Colorado River's principal advocacy organization. "The Bureau of Reclamation puts out inflated projections to give the public a false sense of security, meanwhile the Basin's bank accounts are going down, down, down."

In a letter sent today to Secretary of Interior Gale Norton, on the occasion of the sixth International Day of Action Against Dams, and for Rivers Water and Life, Living Rivers demanded urgent action by the Colorado River's legally designated Water Master. As an initial step, Living Rivers is seeking the Secretary's commitment toward helping to establish a dialogue amongst the basin states, Indian tribes, water users and environmental groups, to begin tackling this critical problem.

The letter outlines two key challenges that need to be addressed.

- Bringing the basin's water use into balance with natural flows by re-negotiating the water allocations established in the Colorado River Compact. These allocations are 20 percent above what the river deliver in years of average flow.
- Establish water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80 percent of Colorado River water, much of it for water intensive and low value crops, such as alfalfa and other feed crops for livestock.

"The Colorado River can accommodate the future needs of the Basin states and Mexico as well as the natural environment. This important goal will most effectively be

accomplished when the Department of the Interior takes the lead in the evolution of management policies which recognize the Colorado River's inevitable constraints," the letter from Living Rivers states.

Living Rivers has established "Drought Watch" as an urgent campaign focus to provide the public with accurate information about the decline in water availability in the Colorado River watershed, and opportunities for the region's water users to alter their consumption patterns without jeopardizing the meeting of human needs, the economy or the environment.

Conservationists Bemoan Diversion of Water From Moab's Mill Creek

SALT LAKE TRIBUNE
BY LISA CHURCH

MOAB -- Grand County's water policies are destroying a sensitive riparian area and threaten to further damage the Colorado River watershed, water conservation activists say.

About 80 rallied Friday in Moab to protest those policies, an event that coincided with the sixth annual International Day of Action Against Dams and for Rivers, Water & Life.

Speakers at the rally, sponsored by Living Rivers, a Moab-based nonprofit group, accused the county of "putting greed before the welfare of the community." The activists

contend the Grand County Water Conservancy District diverts too much water from Mill Creek, a stream that originates with runoff from the La Sal Mountains and flows more than 25 miles through Moab, emptying into the Colorado River. The water winds up in Ken's Lake reservoir, the main source of irrigation water for about 125 farmers and ranchers in the county's southern reaches.

"Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted," said John Weisheit, conservation director for Living Rivers. "Mill Creek's ecology is being destroyed."

Last month, the district petitioned the federal Bureau of Land Management for permission to reduce by half the amount of water it leaves in the stream below Ken's Lake, a move Weisheit said would devastate Mill Creek's native plants and fish. The BLM denied the request. Meantime, the Grand Water and Sewer Service Agency, of which the district is a part, has approved a feasibility study on the cost of diverting Colorado River water to Ken's Lake. The agency owns rights to 10 cubic feet per second of water but has never exercised them because it had no way to get the water to the reservoir.

Increasing Mill Creek's flow is essential to maintaining a healthy riparian area, said Lee Goodman, of Moab.

"Mill Creek is everything people create in their myths as an idyllic place. When you've got something as gorgeous and as important to the human spirit, one shouldn't have to argue over how much water it can have," Goodman said.

Agency manager Dale Pierson said Friday that Grand County water districts encourage conservation. In recent years, he said, district users have reduced water consumption by 25 percent, the state water conservation standard, and last year water use was down by 28 percent from 2001.

"We're doing pretty well, but we can do better," Pierson said. "We want all our customers to be conscious of water use, and to conserve as much as possible."

He said the proposed \$20 million Colorado River plan would add additional water to Ken's Lake that the district would use to establish a separate valley-wide irrigation system. That way, customers who now use water from the culinary system to water lawns and gardens could save money and help the agency cut back on the amount drawn from its aquifer.

However, he said, "We won't build it if it isn't feasible for water customers."

Troubled Delta: Help Save What's Left

For the past year, Living Rivers has been working to stop the Bureau of Reclamation (BuRec) from destroying the most functional piece of Colorado River delta habitat, the Cienega de Santa Clara. BuRec is preparing to submit a report to Congress that recommends the diversion of Cienega water to BuRec's Yuma Desalting Plant. Public input is needed now to help influence this report before it is finalized, as well as letters to Congress once it is submitted.

This rich 14,000-acre biosphere reserve in Mexico receives the only constant flows in the entire two-million-acre delta region. As such, it provides critical habitat for a number of endangered species, and especially for waterfowl traveling the Pacific Flyway between Alaska and South America. The Cienega and 90 percent of the surrounding delta region was destroyed when water diversions from the Colorado River by the United States and Mexico began taking every drop. The Cienega has been revitalized, however, as a result of irrigation drainage from southwestern Arizona that has been diverted into Mexico. BuRec now wishes to capture all this drainage water, and divert it through its mothballed desalting plant in Yuma, Arizona.

BuRec's motive is to add an additional 108,000 acre-feet of water back into the Colorado River, so that a similar amount could be used by farmers upstream. Finally completed in 1992 at a cost of \$253 million, the Yuma Desalting Plant was slated to treat irrigation drainage water and to ensure that water delivered to Mexico met agreed upon water quality standards. However, given the plant's operation costs of \$36 million annually, it has been more economical to obtain the 108,000 acre-feet of water from California, and allow the drainage water to flow on down to the Cienega. Starting up the plant will have the reverse effect—an ecological disaster for the Cienega, and an unnecessary economic burden for US taxpayers.

On March 7, Living Rivers, Defenders of Wildlife, Pacific Institute, Sierra Club, Environmental Defense and Southwest Rivers jointly submitted a critique of BuRec's most recent draft report to Congress. Among the most blatant omissions were hardly any reference to the Cienega and the ecological impacts associated with the loss of its only water source. There was also no mention of the federally listed endangered

species that would be affected by taking this water, including the Yuma clapper rail, desert pupfish and black rail.

To improve the economic picture, BuRec overestimated the desalting plant's output, causing the average price per acre-foot of water produced to be 33 percent lower than what would actually occur. A similar error was made in calculating the plant's primary operating costs: electricity. BuRec used a price of \$32 per megawatt hour, when the actual price is \$44. BuRec hopes that such faulty analysis will not be questioned by Congress, nor that Congress will ask for alternative methods of achieving the required water quality standards.

In fact, the draft report did not address long-term alternatives at all. Living Rivers' analysis reveals that water rights could be purchased or leased from Arizona irrigators at a cost of 75 to 85 percent less than the cost of desalting the drainage water via the Yuma plant. By not relying on the operation of the plant, it can be permanently decommissioned, saving tax payers an additional \$5.1 million annually.

Please join Living Rivers in demanding that a more thorough economic and alternatives analysis be undertaken by BuRec before they submit their report to Congress. Write to: Robert Johnson, Regional Director; Lower Colorado River Region, U.S. Bureau of Reclamation; PO Box 61470; Boulder City, NV 89006-1470; Fax: (702) 293-8614; Email: BJohnson@lc.usbr.gov.

Living Rivers Currents 03/19/03

Mill Creek: Microcosm of the Colorado River

In conjunction with the sixth International Day of Action Against Dams, and for Rivers, Water and Life, Living Rivers initiated a campaign to help revive a small tributary of the Colorado River running just 300 yards from its Moab offices. About 80 people turned out for the noon time rally on March 14.

Mill Creek drops 7,000 feet from the La Sal mountains to its confluence with the Colorado River, 25 miles away. Just like the Colorado, Mill Creek runs dry before reaching its final destination; can no longer support endangered native fish; sees most of its water diverted for taxpayer-subsidized alfalfa irrigation; and receives limited public involvement in decisions affecting its future.

Living Rivers' objective is the return of year-round stream flow by mobilizing public support to reduce the need for extensive diversions. On any given year, from 15 to 40 percent of the water diverted from Mill Creek is lost to leakage in the system's principal reservoir, Ken's Lake. Additionally, the agency responsible for managing this facility often takes more water from the creek than is allowed by their water right. Merely correcting these problems would go a long way toward reviving Mill Creek.

More important are the implementation of programs to help farmers who are potentially interested in making the transition to more water-efficient, higher-value crops. For example, alfalfa can require four times as much water as grapes, and provides the farmer with a crop that yields only \$100 per acre-foot of water, whereas good quality grapes can yield \$7,500 per acre-foot. Living Rivers is advocating similar alternatives for those who use Mill Creek water for water-intensive ornamental landscaping—promoting a switch to drought-tolerant native plants to keep more water in the creek.

Living Rivers Currents 03/19/03

Lake Powell: Running Out of Reservoir

Lake Powell reservoir is down 91 feet from normal; it is officially half empty. The last time it was at this level was 30 years ago when the reservoir was first filling. According to a report that was published in October 1995 by the American Water Resources Association, should a severe and sustained drought similar to past events occur, Lake Powell reservoir is likely to stay empty for approximately eight years.

The National Park Service, which oversees the marina facilities at Lake Powell, has had to make several adjustments to keep the facilities operational since last summer.

Despite these adjustments, three boat ramps are presently closed and the ferry service between two other marinas is also shut down.

Additionally, the recently approved \$70-million Antelope Point Marina Resort is in jeopardy of being built but never used. To be operational, this facility is totally dependent on having a full reservoir. Right now, at Antelope Point, the reservoir is confined between the sheer vertical cliffs of the original Colorado River canyon and is inaccessible. When considering the demand for water in the lower basin states of California, Arizona and Nevada, compounded by the growing realization that a severe and sustained drought is already upon us, it is possible that the resort may not be useable for decades.

At the top of the reservoir, where the Colorado River enters, major sediment problems are surfacing. The sediment deposits of the last 40 years have built a substantial delta forcing boat ramp and campsite closures, and will eventually engulf the concession facilities and the culinary water intakes.

This situation is also causing extensive complications for white water rafters whose multi-day trips through Canyonlands National Park end at Lake Powell. Their primary facility for getting off the water, Hite Marina, is effectively shut down due to sediment. It's difficult for land vehicles to get close enough to the water without getting stuck. This could be a major problem for the multi-million-dollar commercial rafting industry that relies on this stretch of the Colorado.

It has been anticipated that the upcoming snowmelt, and the consequent reservoir rise, might bring some relief for the facilities. But a current projection supplied by the Bureau

of Reclamation does not support such a hope and indicates lowering will continue through the middle of summer. The snowmelt will actually serve to aggravate the situation because the increased river flows will erode and mobilize the suspended sediments upstream, and then redeposit them at Hite Marina where the Colorado River delta is currently expanding.

Decreased recreation is not the only potential impact of the lowering reservoir. If the present drought does not relent, within three years Lake Powell will eventually drain to the level of the penstock tubes that spin the generators at Glen Canyon Dam.

This problem is not just indicative of Lake Powell. The entire Colorado River storage system has dropped from 92 to 59 percent over the past 40 months. In Arizona, a reservoir on the Verde River is completely empty. A reservoir on the Gila River is four percent full and Lake Roosevelt reservoir on the Salt River is 14 percent full. "Lack of access to flat water recreation is the least of our worries," says Owen Lammers, executive director of Living Rivers. "The Southwest plumbing system is headed for complete catastrophe and the Bureau of Reclamation, together with the seven states that use Colorado River water, have no disaster preparedness plan." For ongoing updates, visit "Drought Watch" at the Living Rivers web page.

Flaming Gorge: EIS to be Released

After nearly three years, the Bureau of Reclamation (BuRec) will soon be releasing its draft Environmental Impact Statement (EIS) for the reoperations of Flaming Gorge Dam. The purpose of this EIS is to recommend changes in dam operations to improve habitat for endangered fish along the Green River and in Dinosaur National Monument—the humpback chub, razorback sucker, bonytail chub and Colorado pikeminnow.

For a long time the operation of Flaming Gorge Dam has caused harm to native fish. The introduction of a successful fishery for non-native trout in the dam's tailwaters is a testament to the conditions existing downstream of the dam that make the river inhospitable for native species, which require warmer water for successful spawning and survival. The reservoir traps vital sediments behind the dam, thereby inhibiting sandbar- and beach-building habitat necessary for protecting juvenile fish. The dam, which has no fish passage structure, forms a reservoir which is used and managed for a recreational sport fishery for several

non-native species known to prey on endangered native fish. Conditions are marginal at best for endangered fish survival in the reservoir as well as downstream.

In 2000, Living Rivers formed a nationwide coalition to demand that BuRec fully consider the decommissioning of Flaming Gorge Dam as the most viable alternative to ensuring the recovery of native fish habitat in Dinosaur National Monument. Although a rather significant structure, Flaming Gorge Dam stores very little water, and generates an insignificant amount of hydroelectricity. Its decommissioning, along with that of the much smaller Fontenelle Dam upstream, would allow the Green River to again flow wild and free.

Drought Watch! Demands Action to Avoid Crisis

Reservoir levels in the Colorado River watershed are at their lowest point in history. Over the past three years, they have been declining at a rate of ten percent per year and are now at 59 percent of capacity—an approximate three-year supply for the basin's 25 million residents and farmers. While historical evidence reveals that the present drought is not unprecedented and is likely to continue, the basin's water managers remain unconcerned.

The most recent sustained drought in the basin took place between 1942 and 1977. The regional climate was marked by less snow and fewer summer rains. No major crisis surfaced because Colorado River consumption was much lower than today. Last year the United States Geological Survey warned that a repeat of this drought could be "catastrophic." It is already shaping up to be much worse than the previous one. River flows during the first several years of the present drought are 15 percent below what they were when the 1942 drought began. Despite hopes that an El Niño event would generate above-average precipitation this year, the most optimistic forecasts now call for snowpacks of 20 percent below normal.

When these issues were raised to Commissioner John Keys of the Bureau of Reclamation (BuRec) last month, he stated that his agency had "no plan" for how the federal government would handle water shortages once reservoirs began running dry. BuRec has merely continuously revised its over-optimistic hydrologic forecasts for river flows. Its most recent, on March 3, was a 25 percent downward revision for flows into Lake Powell. In October 2002, BuRec predicted flows would be 10.14 million acre-feet

in the water year of 2003. Now BuRec is predicting only 7.44 million acre-feet—62 percent of normal.

According to Living Rivers' conservation director John Weisheit, BuRec is also overestimating the amount of available water in its reservoirs. "Their available water figures from Lake Mead and Lake Powell reservoirs do not fully account for the sediment which now occupies storage space. There are another two million acre-feet of storage losses, bringing the overall storage in the basin to 55 percent of capacity."

In a letter sent to Secretary of Interior Gale Norton on March 14, on the occasion of the sixth International Day of Action Against Dams, and for Rivers Water and Life, Living Rivers demanded urgent action by the Colorado River's legally designated Water Master. As an initial step, Living Rivers is seeking the Secretary's commitment toward helping to establish a dialogue amongst the basin states, Indian tribes, water users and environmental groups, to begin tackling this critical problem.

The letter outlines two key challenges that need to be addressed. First, bring the basin's water use into balance with natural flows by re-negotiating the water allocations established in the Colorado River Compact. These allocations are 20 percent above what the river delivers in years of average flow. Second, the federal government should establish water use efficiency standards for all irrigators under contract with the Bureau of Reclamation. These users consume more than 80 percent of Colorado River water, much of it for water-intensive and low-value crops, such as alfalfa and other feed crops for livestock.

Mill Creek Rally organizers say Grand County water agency puts greed before welfare of land

Times-Independent by Lisa Church

Moab, UT - Grand County's water policies are destroying a sensitive riparian area and threaten to further damage the Colorado River watershed, water conservation activists said at a protest rally Friday.

The Moab event coincided with the 5th Annual International Day of Action Against Dams and for Rivers, Water & Life, and also commemorated the founding of Living Rivers, a Moab-based non-profit group that promotes water conservation and restoration of Western rivers, officials said.

Speakers at the rally also accused the water agency of "putting greed before the welfare of the community."

Representatives from Living Rivers and other conservation groups say the Grand County Water Conservancy District annually diverts too much water from Mill Creek into

the Ken's Lake Reservoir. Mill Creek originates with runoff from the La Sal Mountains and flows more than 25 miles through Moab, emptying into the Colorado River. It is the main source of irrigation water for about 125 farmers and ranchers in the county's southernmost reaches.

"Water may be pouring off the La Sals, but by the time it makes its way into Moab, every drop has been diverted," said John Weisheit, conservation director for Living Rivers. "Mill Creek's ecology is being destroyed."

Last month, the district petitioned the U.S. Bureau of Land Management for permission to reduce by half the amount of water it leaves in the stream below Ken's Lake, a move Weisheit said would devastate Mill Creek's native plants and fish. The BLM recently denied the request, but activists point to it as an example of the agency's greed.

About 80 people gathered on the Grand County courthouse lawn to protest that request and a feasibility study approved by the Grand Water and Sewer Service Agency - the district's umbrella agency - to examine the cost of diverting Colorado River water to Ken's Lake. The agency owns rights to 10 cubic feet per second of water but has never exercised the right because it had no way to get the water to its reservoir.

Increasing Mill Creek's flow - the stream drops 8,000 feet through the mountains before reaching the Moab Valley - is essential to maintaining a healthy riparian area that is important to the community, said Moab resident Lee Goodman.

"Mill Creek is everything people create in their myths as an idyllic place. When you've got something as gorgeous and as important to the human spirit, one shouldn't have to argue over how much water it can have," Goodman said. "If you see your child being tortured right in front of you, it's important to stand up, to complain."

Agency manager Dale Pierson said Friday that Grand County water districts encourage conservation, and have been successful in promoting lower water use. In recent years, district users have reduced water consumption by 25 percent - the state water conservation standard - and last year, water use was down by 28 percent from 2001, he said.

"I think we're doing pretty well, but we can do better," Pierson said. "We want all our customers to be conscious of water use, and to conserve as much as possible."

He said diverting water from the Colorado River represents another step in reducing the amount of culinary water used by residents. The \$20 million plus project would add additional water to Ken's Lake that the district would use to establish a separate valley-wide irrigation system.

"If this pipeline were built, customers who currently must use water from the culinary system to water lawns and gardens, could save money and help us cut back on the amount water drawn from our underground aquifer," Pierson said. "We won't build it if it isn't feasible for water customers."

Activists hope the public protest will promote dialogue between Grand County residents and water officials.

"We want to work within the community to create responsible water use and conservation with a goal of maintaining our rivers, streams, and ecosystems. But we must also look regionally to restore the balance because we share this area with Native Americans and their values, which are older than ours and more important actually," Weisheit said. "If we continue this way like other hydro-societies, we will lose it all."

LR Letter 03/20/03

Fossil Creek Restoration Threatened

March 20, 2003
Phil Smithers
Senior Designer
APS / Generation Engineering
P.O. Box 53933, m/s 3190
Phoenix, Arizona 85210

Dear Mr. Smithers:

RE: Concerns regarding the restoration of Fossil Creek as agreed upon in the Childs Irving Hydroelectric Project Settlement Agreement and Removal and Restoration Plan between Arizona Public Service and the Intervenor, dated September 11, 2000.

Thank you for submitting the "Childs-Ingving Hydroelectric Decommissioning Update" dated February 03, 2003. We commend you for your work to support the decommissioning of the plants as agreed upon in the Offer of Settlement, Childs/Ingving Hydroelectric Project, Project No. 2069 between the intervenors and Arizona Public Service, submitted September 15, 2000 and the Settlement Agreement (Agreement), dated September 11, 2000.

Your February 3, 2003 Update includes an item under "Ongoing issues related to decommissioning" which is of concern. It reads "Historical – The R & R plan for this project describes removal of the surge tank at the top of the Childs penstock and the removal of contents from the Childs powerhouse. SHPO has raised issues with both. We support leaving the majority of contents in the Childs powerhouse for historical purposes and never intended to gut the building. These are the only issues SHPO has at this time."

First, this is not an ongoing issue as the Agreement includes a Removal and Restoration Plan (Exhibit M) which was negotiated at length between the intervenors and APS, and for which input was received from the US Forest Service, SHPO and

other agencies with a stake in the Proceedings. The Removal and Restoration Plan clearly states:

"The standpipe (30x30') shall be removed" (page 30); and "The Childs powerhouse shall remain as historical feature. All equipment, electrical, mechanical and maintenance will be removed" (page 31).

We will address the surge tank issue first. Leaving the surge tank in place is unacceptable.

Removal of the tank has already been negotiated and agreed upon as is stated in the Offer of Settlement (Offer) between APS and the Intervenor. SHPO and the USFS were both included in those discussions, as stated in the Offer (page 3), with the conclusion that the participants agreed to the Removal and Restoration Plan:

"These negotiations were designed to address the concerns of all interested parties, whether Intervenor in the relicensing proceeding or not. In fact, the settlement negotiations involved several additional parties that did not intervene in the relicensing proceeding, including ...the USFS,...State Historic Preservation Office...

"As a result of the collaboration discussed above, APS, the Intervenor and the Non-Intervenor have reached agreement for the surrender of the Project license and removal of the Project works, as described in the Childs/Irving Hydroelectric Plants Removal and Restoration Plan..."

The Agreement, Section 1.1 reads "The Participants have entered into this Agreement for the purpose of ...(b) approving the Removal and Restoration Plan..." (section 1.1)

"The Participants agree that Project removal, under the terms and conditions of this Agreement, constitutes a reasonable resolution to the dispute between them..." (section 2.1)

Because the Agreement is in place and has been for more than two years, no further discussion of these items should be necessary. However, we will reiterate briefly, for the record why leaving the surge tank in place is unacceptable

The value of preserving the tank for historical interpretation is questionable. The surge tank is a simple symmetrical 30-foot by 30-foot pipe made of concrete. It includes no innovative design, no natural native materials and is of little visual interest or appeal. While a surge tank was important to the production of hydropower at this facility, the need to preserve the tank itself is highly questionable. The tank is physically located well away from the Childs plant where the bulk of historical information will likely be sought. The tank's design and purpose are easily depicted in photos, drawings or verbiage. Removing the tank will have no impact on historical depictions.

SHPO's record for preserving Native American sites is dismal, and it continues to ignore the requests of Native American stakeholders in this proceeding. The Yavapai-Apache, stewards and residents of Fossil Creek long before the appearance of Euro-American settlers, have asked that the surge tank be removed. Yet SHPO continues to ignore them.

As stated by Vincent Randall, Tribal Chairman for the Yavapai-Apache Nation during the proceedings to FERC, September 21, 1999:

“Five-hundred years of stewardship on the land should serve as good cause for us to be acknowledged as real life stakeholders at the table. We believe the Nations voice should have official status along with the other participants when decisions are being made about such a traditionally significant place.”

In a letter of June 5, 2000, Vincent Randall stated:

“As we stated in the letter Chris presented on our behalf in May the Yavapai-Apache Nation was initially drawn to the process by the concept of full restoration for Fossil Creek....

“We believe the idea of full restoration is a noble one. Is the surge tank really intrinsic to the Euro-American experience in the west? ... The Yavapai-Apache Nation is pro preservation, but we see it as a matter of strict triage. Can the APS story be told without the actual surge tank? Yes, we believe it can. Will the touring public be diminished if the surge tank is removed? No, we believe it will not. Is the concept of returning the landscape to as close to the pre APS condition as possible a noble one? Yes, indeed it is. Is the skylined surge tank part of that condition? No it is not.”

Over and over, in the state of Arizona, ancient Native American sites have been photographed, at best, and then bulldozed with SHPO's blessing in the name of development. Now, the Yavapai-Apache are requesting one small concession from SHPO in this historical opportunity to restore a site that holds cultural and spiritual significance for their Nation.

We find SHPO's insistence on preserving the concrete tank, against the express wishes of the Yavapai-Apache Nation, shameful and appalling. We would hope that no admonition to the USFS concerning respect for the Nation in this matter is necessary.

The goal of the restoration plan is to return the area to its natural state as much as possible. The Introduction of the Removal and Restoration Plan reads, "The following plan is based on limiting damage to the surrounding environment while returning the environment as close as practicable to its native state." The native state did not include a three-story concrete tank. Moreover, the tank is a visual scar on the landscape and interferes with the enjoyment of a "natural" area.

The surge tank will be an obvious target for graffiti and will increase maintenance costs. With restoration, Fossil Creek will become a more desirable recreation destination, drawing larger crowds, and with potential historical signage regarding the surge tank, drawing them specifically to the tank. The USFS and SHPO should consider whether it has the funds to continuously remove graffiti and trash from the tank. Should the tank be left in place, we will seek designation regarding who will patrol the tank area and how often the maintenance work will be performed.

The tank represents a liability. The USFS and SHPO, as well as APS, should consider the safety and legal issues they may encounter given that the tank represents an

"attractive nuisance". Again leaving the tank in place and perhaps including signage drawing people to the tank is irresponsible. Putting a fence around the tank will only add to the nuisance factor and certainly does not constitute "removal and restoration."

The next issue at hand is APS' request to leave the electrical, mechanical and other equipment in place in the Child powerhouse. We recognize that APS has and will continue to incur substantial costs in complying with the terms of the Agreement and with the Federal Energy Regulatory Commission's requests for information to support APS' Surrender application. We also appreciate the contention that the contents of the powerhouse may be helpful as a means of interpreting the historical production of hydroelectric power at the plants. As such, we do not intend at this time to object to leaving the majority of the contents in the Childs powerhouse.

Sincerely,

Lisa Force
Program Director

Water and Sewer Board irked by questions raised in letters and rally

Times-Independent by Lisa Church

Moab, UT - Recent protests and letters to The Times-Independent questioning the business practices and the fairness of the Grand Water and Sewer Service Agency (GWSSA) board structure prompted one board member to ask agency employees to develop charts and literature explaining how the agency is organized and operates.

Rex Tanner, a member of the agency operating committee, took issue with statements and statistics disseminated by Living Rivers - a Moab-based non-profit group that promotes water conservation and restoration of Western rivers - in news releases and at a rally two weeks ago protesting the agency's water management practices. Tanner characterized as "outrageous" statements made by the group, and said a letter to the

editor in the March 20 issue of The Times. The letter writer called the agency to task for holding "secret meetings" in reference to legally-allowed executive session discussions held by the board, clearly show that area residents do not understand the workings of the agency and the laws governing public boards.

"There's just so much misinformation floating around out there. The newspaper should not be telling people in this county what this agency is doing. The agency should be doing that," Tanner said.

But James L. Walker, a member of the Grand County Water Conservancy District Board, disagreed. Walker said groups like Living Rivers, and others in the community will choose to misinterpret the agency's actions in order to push their own agendas.

"Every time you give them more information they still interpret it however they want," Walker said. "All you do by giving them more information is to give them more ammunition to use against us."

Agency board president Gary Wilson questioned whether developing informational literature for the public is the best use of staff time. State and federal law require all public agencies to provide certain documents and information upon request by citizens, and Wilson said the agency always complies even though doing so often constitutes a drain on staff.

"It takes a tremendous amount of the staff's time to provide this information," Wilson said. "But we do it because we have to."

River News 03/27/03

RRFW Riverwire PEARCE FERRY RAPID UPDATE

The normally tranquil waters of the Colorado River are beginning to become turbulent at two points near Pearce Ferry, Arizona just past the western boundary of Grand Canyon National Park. This reach of the Colorado River is controlled by the water level of Lake Mead. When the lake is near full pool, a large lake with no current greets river runners departing the end of Grand Canyon. But with the 4th year of drought continuing, the unusually low level of Lake Mead has caused the Colorado River to entrench into the sediment deposited in the upper reaches of the lake. The river is flowing with strong current at the Ferry. The river no longer follows its historic channel and is now flowing over low gravel hills approximately one mile north of Pearce Ferry. Two new riffles have formed in this area.

The upper riffle, at approximately river mile 280, is a series of small standing waves stretching almost all the way across the river, which is about 150 feet wide at this point.

A fast channel has developed on the river right side of the riffle. The lower riffle is forming where the river is cutting through a saddle between two small hills.

At this time, these riffles pose no difficulty to river travelers, but have the potential to upset articles laid out on watercraft decks. Night floating through this area is not recommended. This area has the potential to form serious rapids as Lake Mead is projected to drop 12 to 15 feet in the next 4 months.

Photographs of these two riffles are at www.vishnutemplepress.com/pearceferry.html

LR in the News 03/30/03

West's water at risk as Utah lake shrinks

By Stuart Leavenworth Sacramento Bee Staff Writer Monday, March 31, 2003
LAKE POWELL, Utah -- When John Wesley Powell embarked on his historic trip down the Colorado River in 1869, he described a raging, foaming torrent of water, rapids "that reel and roll and boil ... making a wild music."

It is doubtful Powell would recognize the Colorado River now. As it enters the lake that bears his name, the river looks more like a creek than a cataclysm. Starved by four years of drought, the nation's second-largest man-made lake has dropped to its lowest point in three decades. It is the Amazing Shrinking Reservoir, and its rapid downsizing is sending ripples across the West, even up to Northern California.

Unsure about supplies from the Colorado, Southern California is buying water from Sacramento Valley rice farmers. Las Vegas also is scrounging for supplies. Environmentalists are saying "we told you so," and Lake Powell's major industry -- houseboating -- isn't floating like it once was.

On a recent weekend, boat owners Rob and Darcy Yates drove to the upper tip of Lake Powell and stood stunned by the miles of sunbaked mud flats before them.

"The environmentalists have wanted to drain Lake Powell for years," said Darcy Yates, a flight attendant from Lehi, Utah. "It looks like they will finally get their wish."

Normally holding 7.8 trillion gallons of water and stretching 180 miles into two states, Lake Powell is dropping a foot a week, slowly exposing the sinuous canyons that federal engineers flooded when they built Glen Canyon Dam in the early 1960s.

If the dry spell continues, officials of the U.S. Bureau of Reclamation will have to prepare for the unthinkable. Eventually, they say, the lake could drop so low it will stop feeding the hydroelectric penstocks that generate \$70 million in power yearly for 1.7 million people throughout the Southwest. At that point, the water supply of 25 million people in California, Nevada and Arizona would also be in jeopardy.

"We could witness the draining of Lake Powell in our generation," said John Weisheit, conservation director of Living Rivers, an environmental group based in Moab, Utah. "When a big drought comes on the Colorado, no amount of reservoirs will help."

Even federal officials, who rarely acknowledge their projects are vulnerable to nature's whims, say the next few years could be crucial.

"It is never too early to start getting a little concerned," said Rusty Gattis, deputy manager of Glen Canyon Dam. "You never know what the next day may bring."

Seen from the air, Lake Powell looks like a giant blue Rorschach blotch splattered across the red-rock moonscape of southeastern Utah. When full, the reservoir holds enough water to cover Pennsylvania a foot deep. Now, it has dropped to half its volume, leaving behind a white ring of calcified rock on its vast, 1,960-mile shoreline.

Scientists disagree on what is happening to Lake Powell and other depleted reservoirs of the Colorado basin.

Some say the watershed is experiencing a normal boom-and-bust cycle -- illustrated by the huge snowstorm that walloped the Rockies two weeks ago. Others say the region is undergoing a climatic shift that could lead to multiyear droughts unseen during this century.

Nowhere are the stakes higher than in Page, Ariz., a town of 9,000 near the Utah border that is entirely dependent on Lake Powell. Some 2.5 million people visit Page and the Glen Canyon National Recreation Area each year, spending an estimated \$400 million on houseboat and Jet Ski rentals, motel rooms, fishing gear, boat tours and countless gallons of sunblock.

Business leaders say despite the low water, Lake Powell is still the floating party it once was.

"The press keeps putting out the message that the lake is gone, or half-empty," said Joan Nevills Stavelly, director of the Page-Lake Powell Chamber of Commerce. "We like to say that the lake is half-full."

Even so, the drought has created some challenges, as Stavelly readily acknowledges. Already, three boat ramps are unusable because of the low water. The National Park Service is spending \$2.5 million to extend the boat ramps before the tourist season starts in May.

The drought also has complicated the task of reaching popular destinations, such as Rainbow Bridge, the world's largest natural rock arch.

Four years ago, tourists could boat within eyesight of Rainbow Bridge. Now, they must dock a half-mile away and walk along a floating gangplank and trail to the sweeping, 290-foot-high arch.

Velma Stoss, an Arizona native who now lives in Seattle, returned to Rainbow Bridge two weeks ago and was taken aback as she hiked up the trail.

"When you think about the amount of water that has been lost, it is staggering," said Stoss, gazing at the dried-up side canyon beneath Rainbow Bridge. "I guess it is going to California."

Stoss is partly right. Although Lake Powell provides recreation and hydropower, its main function is to convey water from the upper Colorado basin to states downstream. Under the 1922 Colorado River Compact, the four states of the upper basin -- Utah, Colorado, Wyoming and New Mexico -- must release 8.2 million acre-feet (or 2.6 trillion gallons) from Powell each year, no matter how much flows into the lake.

About half of that goes to Southern California.

In effect, Lake Powell serves as a massive security blanket for the upper basin states, which might otherwise have to tap their own reservoirs to send water downstream. But it hasn't come without a cost.

As Lake Powell filled Glen Canyon, it drowned miles of fern-lined canyons, Anasazi Indian ruins, petroglyphs and mysterious rock arches and chambers like the Music Temple and Cathedral of the Desert. The casual loss of this natural heritage angered artists and environmentalists, some of whom cling to a hope that Glen Canyon Dam will one day be decommissioned and the canyon eventually restored.

One of these is Rich Ingebretsen, a Salt Lake City emergency room doctor and an unlikely activist. A descendent of Brigham Young, Ingebretsen spent his youth rafting down the upper Colorado River. When Lake Powell started to submerge some of his favorite rapids, Ingebretsen saw his calling in life and founded the Glen Canyon Institute, one of several groups committed to draining the lake.

Wearing a cap that reads "Damn Dam," Ingebretsen recently rented a motorboat and went in search of some of Glen Canyon's lost wonders.

Heading south from Hall's Crossing marina, Ingebretsen rounded one sheer cliff after another, then turned right into the Escalante arm of Lake Powell, then left at a side canyon. Soon the boat was entering an increasingly narrow, curved chamber, wide at the bottom with a slender parabola of sunlight descending from above.

"This is the entrance to one of the most famous places in Glen Canyon," pronounced Ingebretsen as he entered a cavern called the Cathedral in the Desert. "We are going to see something people haven't seen in years."

A favorite haunt of early canyon explorers, the Cathedral has been called a masterwork of natural architecture. During its heyday, a slim waterfall fell from the lower part of the cavern; now the cascade is submerged. The bottom walls are discolored from years of high water, but still the Cathedral is an ethereal place, a water-carved amphitheater of streaked sandstone, shifting light and reverberating echoes.

For seven years, Ingebretsen has been trying to rally people around the idea of bringing back these jewels by draining Lake Powell. Some say his quest is quixotic. Others call him crazy.

Not surprisingly, Ingebretsen isn't a popular figure in Page, a town whose founders helped build Glen Canyon dam. The town stopped welcoming environmentalists in 1981, when a group of Earth First! activists climbed onto the dam and unfurled a banner that depicted a giant crack down the side.

Water managers in California and Arizona also scoff at the idea of draining Powell.

Dennis Underwood, a former Bureau of Reclamation commissioner, says the drought would be far more serious if the reservoir wasn't there. Without Lake Powell, he said, lower basin states would be close to exhausting the Colorado's downstream reservoirs, such as Lake Mead, backed up by Hoover Dam. "You'd have trouble meeting the needs of the lower basin," said Underwood, who now works for the Metropolitan Water District of Southern California.

Even with Lake Powell, the region's water prospects are hardly secure.

According to the U.S. Census Bureau, the combined cities of Phoenix, Las Vegas and Los Angeles are adding about 350,000 people every year. Las Vegas in particular is a major water consumer, using 307 gallons per person daily -- about twice as much as residents in Los Angeles.

In recent months, Las Vegas officials have started restricting the water pumped to golf courses, raising the ire of resort owners. The city is mulling other conservation measures, although critics such as Weisheit, of the environmental group Living Rivers, say the measures are mostly window dressing.

For several years, various California agencies have been haggling over a proposed water sale between the Imperial Valley and San Diego, aimed at securing Southern California's access to surplus water from the Colorado River.

Now, however, federal officials are unsure if there will be much surplus water in coming years. As a result, the Metropolitan Water District has been lining up backup supplies, such as the water it is purchasing from Sacramento Valley rice farmers.

Even the recent storm in the Rocky Mountains -- which dumped several feet of snow -- didn't help prospects much.

As it melts, much of that snow is expected to soak into the parched soil of the region, leaving little for reservoirs, said Barry Wirth, a spokesman for the Bureau of Reclamation. Lake Powell as a whole is expected to drop for a few more weeks, level off with spring runoff, rise a few feet and then starting dropping again this fall.

Ultimately, many water analysts say, the western United States will have to confront some root causes of the water crunch in the Colorado basin. When they divided up water supplies in 1922, the basin states overestimated the average yield of the river and went on to develop cities, farms and reservoirs based on an unrealistic estimate of nature's bounty.

Now, say Reclamation officials, the upper basin is struggling to send water downstream as a historic drought collides with a historic population boom.

"Everything is really tight," said Wirth, who works out of Salt Lake City. "As every year goes by, and another moving van moves into Grand Junction and Salt Lake, it gets a little harder."

Colorado blizzard not helping drought

Kansas City Star
JUDITH KOHLER
Associated Press

DENVER - Colorado's worst blizzard in nearly a century fell on the wrong side of the Continental Divide for much of the drought-parched West.

The mountain snowpack that feeds river basins serving eastern Colorado rose to more than 100 percent of average levels after the storm. But the snowpack feeding the Colorado River basin, which provides water to seven Western states, rose only slightly.

Most states plan to keep in place voluntary or mandatory water restrictions and conservation measures, saying it is too early to tell what the summer will bring.

"There's not any meaningful change," said Wayne Cook, executive director of the Upper Colorado River Commission, based in Salt Lake City. "Maybe next time you could send (the snow) over in a truck or something, dump it over the top, let it run down this side of the hill."

A 1922 agreement allocates Colorado River water among the states. Colorado, Wyoming, Utah and New Mexico get water from the upper part of the basin and California, Nevada and Arizona get water from the lower basin.

Water agencies from Las Vegas to Santa Fe, N.M, closely track storms in the Colorado mountains, where snowpack is even more critical in drought years.

"What impacts us is snow in the Colorado Rockies," said Vince Alberta, spokesman for the Southern Nevada Water Authority, which serves Las Vegas.

The blizzard dumped up to 8 feet of snow in a 500-mile swath in Colorado and southeastern Wyoming the week of March 17, primarily falling on the east side of the Continental Divide.

In river basins serving eastern Colorado, the storm increased projected snowpack runoff from 61 percent of the historical average to 65 percent this year. That is up from the 14 percent recorded at the end of the spring melt last year.

The blizzard barely registered in the Colorado River's lower basin, where the projected runoff remained at about 62 percent, said Colleen Dwyer, spokeswoman for the U.S. Bureau of Reclamation in Boulder City, Nev.

The snowpack percentage is measured against a 30-year average. Melting snow contributes about 80 percent of the water in rivers, streams, lakes and reservoirs, which comprise much of Colorado's water supply.

The blizzard was encouraging but one good season won't wipe out four years of below-average snowpack, Alberta said. His water authority will maintain limits on outdoor watering and types of lawns and water recycling.

In Wyoming, the snow will help parched grasslands in the southeastern region where ranchers have struggled to keep their cattle fed. The rest of the state will benefit little, state climatologist Jan Curtis said.

"Having been in a drought for three to four years now, we are probably so far behind so far as moisture deficit that it would probably take seven of these types of storms to get back to normal," she said.

In the Denver area, paralyzed for days by hip-deep snow, initial glee about the storm's impact on the drought has turned into measured enthusiasm.

"How wonderful! This is really going to help us out," Peter Binney, utilities chief in the Denver suburb of Aurora, said when heavy snow started March 18. Reservoirs that feed Aurora are so low that there's a ban on new lawns and planting vegetables and new flowers.

A week later, Binney was still optimistic, but cautious. "I'd like to see a couple more of these in the next couple weeks," he said.

More snow and rain were predicted for the mountains and foothills, where spring can be the wettest time of the year. El Nino is credited with breaking the region's dry cycle this year.

Vivienne Fink still plans to tear out her Kentucky bluegrass lawn and replace it with ornamental grasses, boulders and native plants.

"I just really don't want to have to pay for watering a lawn that probably shouldn't be there in the first place," she said.

The moisture will allow farmers to delay irrigating for a couple weeks, but "it certainly doesn't end the drought crisis," said Bob Sakata, one of Colorado's largest vegetable producers.

Colorado's blizzard won't do much to relieve the drought in the West, said John Weisheit of the environmental group Living Rivers in Moab, Utah.

He said he is concerned that a wet spring will lead people to ease up on conservation. The Colorado River can't meet the area's growing demand even in good years because the water is overallocated, he said.

Wetter-than-normal seasons in the 1980s and 1990s helped mask that fact, Weisheit said.

"We've been lucky, is what we've been," he said. "Now our luck's run out."

RRFW Riverwire RIVER PLAN DRAFT NOW SET FOR OCTOBER RELEASE

Grand Canyon National Park planners have pushed back the release of the release of the Draft Management Plan for the Colorado River Management Plan to the fall of this year. RRFW has learned that the NPS is now looking for release of the Draft River Management Plan for no later than October 31, 2003.

RRFW has also learned that the reason for the delay is to allow Grand Canyon National Park planners to include advice from a National Park Advisory Board subcommittee made up of concessioners, nonprofit groups and others. RRFW has not yet discovered how this group will be formed, however we do know that among those pushing for the formation of this Advisory Board subgroup are Grand Canyon River Outfitters Association Executive Director Mark Grisham and GCROA consultant Destry Jarvis.

Besides releasing a Preferred Alternative, Grand Canyon National Park planners expect to have 5 to 6 other alternatives in the draft. One of the alternatives will be a motor-free alternative. Park planners are still looking to have a Final CRMP by December 31, 2004, so that river concessions contracts can be renewed in 2005. All 16 of the river concession contracts will terminate if not renewed on December 31, 2005.

RRFW RIVERWIRE - CONCESSIONAIRES HIRE DC LOBBYIST

T. Destry Jarvis has recently been hired to lobby for the Grand Canyon River Outfitters Association, a trade association established to protect the economic interests of 16 Grand Canyon river concessionaires. Mr. Jarvis will be influencing the CRMP to benefit his employers, especially in Washington D.C., where he lives. Mr. Jarvis recently noted that powerboats on the Colorado River in Grand Canyon are "necessary for the future good condition of the park and the provision of high quality visitor river experience

there.” He also stated in a recent article for the Boatman’s Quarterly Review (Spring, 2003), that “...all concerned should come to realize that the river experience is enhanced, and the park’s resources are better conserved, with motors, while both the experience and the resource are diminished without.”

Jarvis’ position is that the exceptions to the Wilderness Act that have allowed motors shape the real application of it more than the Act’s actual language. This is relevant since his various interpretations of the Wilderness Act appear to hinge on where his paycheck comes from. While employed as Federal Policy Director at National Parks Conservation Association, Jarvis wrote a letter defending the 1980 CRMP’s proposed phase-out of motors in Grand Canyon National Park to NPS Director Russell E. Dickenson.

“...the decisions to ban motors in the Grand Canyon...were not made lightly, but only after years of discussion, study and consideration.” he admonishes the Director. Mr. Jarvis went on to say, “The Service can not afford to allow additional years of contentious debate on these issues, if progress is to be made in any other of the many problem areas deserving your attention. NPCA urges you to stand firm on these important principles.”

“What changed his mind? There have been no amendments to the Wilderness Act, no changes in the underlying spirit, values and principles of Wilderness. The intent of Zahniser and wilderness advocates and contemporaries Olaus Murie, Aldo Leopold, Supreme Court Justice William O. Douglas and Bob Marshall is clear. Time and again they wrote that motorized transportation is antithetical to Wilderness.” notes Jo Johnson, co-director of River Runners for Wilderness.

Johnson went on to observe “If Jarvis is so sure powerboats are fine in Wilderness, why is it necessary for him to lobby legislators for a Grand Canyon Wilderness Bill that leaves its heart--the Colorado River--out? Why not just allow Congress to designate the entire Grand Canyon, with the River, Wilderness? Is it possible he isn’t convinced and therefore must hedge his, or rather, GCROA’s, bets?”

“Now more than ever, we need the peace and solace of motor free Wildernesses in Grand Canyon and elsewhere. The meaning of Wilderness was clear in 1964, it was clear at the time of Mr. Jarvis’ 1980 impassioned plea to get rid of motors, and it remains clear now. If there is any place on Earth that deserves to be free of motors, it has to be Grand Canyon.” Johnson remarked.

Trying to make sense of current water controversy (part one)

Times-Independent

Moab, UT

by Lisa Church

contributing writer

Ask a dozen people in Grand County to explain how the Grand Water and Sewer Service Agency works, and you're likely to get a dozen different answers. Factor in the three individual water districts that have pooled their resources under the GWSSA umbrella and the confusion deepens to bewilderment.

In the West, where control of water wields considerable power, it is not surprising, then, that this complex organizational structure devised to manage and distribute culinary and irrigation water in Spanish Valley and throughout Grand County has become a lightning rod for critics who contend that too much water in the valley is now controlled by governing bodies representing the interests of too few county residents. Conversely, staunch defenders of the system maintain that the agency serves the interests of the public by protecting and preserving the valley's valuable water resources.

This great divide in public thinking is deeply rooted in the history of modern water development in Grand County and the chain of events that led to the creation of GWSSA in 1998.

First there was a dam: Creation of the Grand County Water Conservancy District

In the early 1970s, most water rights in Grand County were still privately owned, or were vested in the Moab Irrigation Company, a private corporation made up of individuals who elected to convert their water rights into shares of stock in the larger company. Because growth in any modern community is intrinsically tied to that community's ability to provide its residents with adequate water and sewer services, Grand County officials during this time recognized the need to begin developing a stable water system within the valley.

Their solution: form a water conservancy district that could acquire water rights, build infrastructure including a dam, storage and delivery system, and offer water services to farmers, ranchers and residents in Spanish Valley.

Under state law, water conservancy districts are formed by district courts, and are considered state, not county, agencies. The governor appoints the district's five board members, although the county may recommend names for appointment. However, state law requires a petition, signed by at least 20 percent of landholders within the district, be presented to the court requesting the court to create the conservancy district.

Like all state water conservancy districts, the Grand County Water Conservancy District, created by the 7th District Court in 1971, has the right to hold water rights, and to provide irrigation and culinary water service to customers within the service district. GCWCD's district includes all of Grand County, and 370 adjacent acres in the San Juan County portion of Spanish Valley.
